ITALIAN EDITORIAL BOARD

Editor in Chief, Massimo PALLOTTINO, University of Rome. Section Directors: *Modern Art*, Giulio Carlo ARGAN, University of Rome; *Oriental Art*, Mario BUSSAGLI, University of Rome; *Ancient Art*, Michelangelo CAGIANO DE AZEVEDO, Università Cattolica del S. Cuore, Milan; *Medieval Art*, Géza DE' FRANCOVICH, University of Rome; *Primitive Art*, Vinigi L. GROTTANELLI, Pontificium Athenaeum Urbanianum de Propaganda Fide, Rome. Consulting Director, Sabatino MOSCATI, University of Rome. Coordinating Committee: Mario SALMI, President of the International Council of Scholars; Giuseppe TUCCI, Vice President of the International Council of Scholars; Massimo PALLOTTINO; Giulio Carlo ARGAN.

AMERICAN EDITORIAL ADVISORY COMMITTEE

W. G. CONSTABLE, formerly, Boston Museum of Fine Arts; Lloyd GOODRICH, Director, Whitney Museum of American Art; Henry-Russell HITCHCOCK, Smith College; Oliver W. LARKIN, Smith College; Bernard S. MYERS, formerly, The City College, New York; Gisela M. A. RICHTER, Honorary Curator, Metropolitan Museum of Art; Paul S. WINGERT, Columbia University.

EDITORIAL STAFF FOR THE ISTITUTO

Secretary General: Prof. Alberto Mario CIRESE. *Section Editors*: Dr. Catia CAPRINO; Dr. Ernesta CERULLI; Dr. Paolo DAFFINÀ; Dr. Luciana FERRARA; Dr. Fernanda de' MAFFEI; Prof. Luigi SALERNO. *Consulting Editor*: Prof. Eugenio BATTISTI. *Editorial Assistants*: Dr. Margherita ABBRUZZESE; Dr. Margherita ALOSI CATELLI; Dr. Tea MARTINELLI COCO; Dr. Anna Maria ROVERI; Dr. Italo SIGNORINI.

Illustrations. Editor: Prof. Alessandro MARABOTTINI MARABOTTI. *Consultants*: Maria CALANDRA, Architect; Dr. Enzo CREA. *Assistants*: Dr. Assunta BOSCHETTI ALBANESI; Dr. Gemma CORTESE DI DOMENICO; Prof. Raniero GNOLI; Dr. Romolo STACCIOLI; Dr. Anna Maria TAMASSIA; Paola VERGARA CAFFARELLI.

Copy Editing and Index. Editor: Dr. Nicola TERRANOVA. *Assistants*: Dr. Gigliola BONUCCI CAPORALI; Dr. Maria BORSELLINO DE LORENZO; Dr. Emilia BOSCHERINI GIANCOTTI; Adriana CARINI; Dr. Marco CHIARINI; Dr. Giovanni CRAPULLI; Dr. Elsa FUBINI; Prof. Alberto GIANQUINTO; Elena GRILLO; Dr. Elena OTTOLENGHI; Dr. Giorgio STACUL; Dr. Mario TRONTI; Dr. Franco VOLTAGGIO. *Secretary*: Dr. Bianca Laura DE VITA FASANI.

STAFF FOR THE McGRAW-HILL EDITION

Managing Editor: Beatrice CARSON.
Associate Managing Editor: Robert BRAINERD.
Administrative Assistant: Sally Cook PERRA.
Senior Editor: Dorothy CODDINGTON.
Translation Editor: Lucille P. KERR.
Translation Assistant: Fernanda de' MAFFEI.
Research Editor: Lideke HOFFSCHOLTE.
Researchers: Julia BALLERINI; Barbara BRYANT; Franca CAMIZ; Judith EASTMAN; Marcia RACKOW; Nicole RZEWSKI; Judith TEMESY-ARMOS.
Illustrations: Erika BIZZARRI; Françoise CHIARINI.
Bibliography: Neil THOMPSON.
Copy Editors: Barbara ANGELILLO; Nora BEESON; Iris BLUMENTHAL; Patrick J. BURY; Florence DANKO; Ruth EISENSTEIN; Cecily R. FORTESCUE; Carlos MÉNDEZ.
Proof Editor: Gordon GIDLEY.
Proof Assistants: Clodagh M. FLAHERTY; Pamela JONES; Raymond C. PHILLIPS, JR.
Consulting Editor: Bernard S. MYERS.
Index Editor: Delight ANSLEY.
Executive Editor: David EGGENBERGER.
Administrative Editor: M. Barat Kerr SPARKS.
Coordinating Editor: Edmée BUSCH.

TECHNICAL STAFF

Technical Director: Dr. Matilde GIACHETTI, Casa Editrice G. C. Sansoni. *Technical Assistants*: Dr. Catervo BLASI FOGLIETTI; Giulio GIUFFRIDA RUGGERI. *Photographic Archives. Director*: Dr. Enzo CREA. *Assistant*: Dr. Paola DE GASPERI. *Maps*: Prof. Mario RICCARDI; Giuliana CAPORALI. *Drawings*: Bruno BARINCI, Architect. *Plate layout*: Piero BERTA; Paolo BUDASSI.

NOTES ON THE ENGLISH EDITION

Standards of Translation. Contributors to the Encyclopedia, drawn from the outstanding authorities of over 35 different countries, have written in many languages — Italian, Spanish, French, German, Russian, etc. To ensure faithful translation of the author's thought, all articles have been translated into English from the original language, checked for the accuracy of technical terms and accepted English forms of nomenclature by English and American art historians, and correlated with the final editorial work of the Italian edition for uniformity and coherence of the over-all presentation. Naturally the McGraw-Hill Book Company assumes full responsibility for the accuracy and completeness of all translations. Those articles written in English appear in the words and style of the authors, within the bounds of editorial attention to consistency and stylistic and organizational unity of the work as a whole. Article titles are in most cases parallel to those in the Italian edition, though occasionally they have been simplified, as *Dravidian Art* for *Dravidiche Correnti e Tradizioni.*

New Features. Although generally the English-language edition corresponds to the Italian version, a small number of purely editorial changes have been made in the interest of clear English-language alphabetization and occasional deletions or amplifications solely in the interest of clarity. Three major differences between the two editions do exist, however:

A considerable number of cross-references have been added in many places where it was felt that relating the subject under consideration to other pertinent articles would be of value to the reader.

A more extensive article on the Art of the Americas was projected for Volume One of the English edition with an entirely new text and many plates in black and white and color. This article was designed to give the completest possible coverage within the existing space of some 100,000 words to a subject which, because of its interest to the English-speaking public, was entrusted to a group of well-known American scholars, each expert in his respective area.

Some 300 separate short biographies have been added to the English edition to provide ready access to data on the lives, works, and critical acceptance of certain artists identified with schools, movements, and broad categories of historical development that are treated in the longer monographic articles. These articles are unillustrated, but works of the artists are represented in the plates accompanying the longer articles.

Bibliographies. The bibliographies of the original Italian edition have been amplified at times to include titles of special interest to the English-speaking world and English-language editions of works originally published in other languages.

In undertaking these adaptations of the Italian text and preparing original material for the English edition, the publisher has been aided by the generous advice and, in many cases, collaboration of the members of the Editorial Advisory Committee.

TEXTILES, EMBROIDERY, AND LACE. The art of weaving is among the most ancient of man's crafts. It passed from a strictly utilitarian phase, concerned primarily with supplying protection from the elements, to subsequent phases in which esthetic considerations conditioned the forms of production, making them parallel to those of the art activity of a given period.

The history of textiles is closely tied to that of embroidery and lace, since the latter represent, in spite of their autonomy of forms and of development, a decorative complement of textile production. The origins of embroidery are also ancient; this art, however, appears in the more developed phases of the various cultures because of its decorative character. Lace, generally representing a particularly refined esthetic expression, is a relatively modern development, having been a creation of the Italian Renaissance.

Certain specialized products of the textile arts such as tapestry and carpets (q.v.) are treated in separate articles.

SUMMARY. Introduction (col. 1). Techniques and materials (col. 5). The ethnological world (col. 6). Textiles (col. 10): *Alexandria and Byzantium; Italy; Spain; France; Germany and northern Europe; Contemporary European production; China; Japan; India; Iran; Egypt, Syria, and Asia Minor.* Embroidery (col. 25). Lace (col. 31). Folk textile arts (col. 33).

INTRODUCTION. Although early man undoubtedly possessed some knowledge of the textile art, which includes netting, wattling, basketry, the spinning of yarn, and the weaving of cloth, the major development of the art came at a fairly late date in his cultural development.

In the tropical regions where he most probably originated, the sun and the air refined the coat of coarse hair covering early man's body from head to foot and finally caused it to disappear. He later acquired the desire for artificial body covering; many reasons have been suggested for this, the major ones being the need for protection against the natural elements, the craving for adornment, and the impulse toward modesty. Animal skins served for clothing at first, but in his evolution from food gatherer to food producer with permanency of abode, man learned to cultivate grain for food and to domesticate the sheep, the goat, and the camel. Eons elapsed before he learned to spin the short fibers from the coats of these animals into a crude yarn, and contemporaneously with the use of animal fibers he learned to domesticate the wild flax grasses which he twisted into linen yarn; it is not known, however, whether animal or vegetable fibers were used first.

Flax was the most widely used vegetable fiber, but ramie, hemp, and other bast fibers were twisted into yarn and woven into fabric at a relatively early period in the history of textiles. Hemp was the most important fiber used in the northern part of the European continent; flax was the most widely used fiber in the southern part and in Egypt.

Wool was the principal fiber used for textiles in the pre-Christian era in Palestine, Syria, Babylon, Greece, and Italy. The Babylonians and Assyrians, as well as the Phoenicians, developed a comprehensive knowledge of the textile arts at the same time as the Hebrews and Egyptians, wool being their most important fiber.

The wealth of nomadic peoples was measured by the size of their flocks of sheep and goats, but sheep- and goat-herds belonged to the fifth, or lowest, order of the Egyptian people and were looked upon with contempt by the aristocracy. When the brothers of Joseph and their families went to settle in Egypt, Joseph took special care to warn them of the attitude of the Egyptians toward shepherds: "For every shepherd is an abomination to the Egyptians" (Gen. 46:34).

Cotton, called both "karpas" and "koton," was mentioned in Palestine at least as early as the time of King Solomon as being imported mainly from Egypt. In India the first mention of cotton, referred to as *karpassi*, is in the ancient Hindu Laws, or Code, of Manu (ca. 400 B.C.–A.D. 200), although archaeological findings at Mohenjo-daro indicate that cotton was known and used in that country as early as 3000 B.C.

The cotton plant has an interesting legendary history, having been variously called the "wool-bearing cotton plant," the "Scythian lamb," and the "vegetable lamb of Tartary." The ancient Chinese called it the "lamb plant," it being said the "cotton lambs" grew on shrubs, each cradled in its own downy pad. The stem of the plant was supposed to be flexible, permitting the bolls to bend down and graze on the adjacent herbiage. When all the grass within this narrow orbit had been eaten, the lambs disappeared, leaving their coats behind.

The early Greeks referred to cotton as the "fiber of wool-bearing trees." In 425 Herodotus (Book III, 106) wrote, "The wild trees in India bear for their fruit a fleece surpassing that of sheep in beauty and quality, and the natives clothe themselves in cloth made therefrom." Alexander the Great brought back from India cotton cultivators and craftsmen and settled them in Asia Minor. Pliny (*Historia naturalis*, XIX, ii, 14) wrote that Semiramis, legendary Queen of Assyria who later conquered Egypt, was the founder of many manufactories along the banks of the Nile that specialized in producing fine cotton cloths.

The antiquity of the textile art is evidenced by spindle whorls, the small, perforated, disk-shaped weights of stone or other material used as balance wheels on the spindle shafts. Spindle whorls discovered in Asian Turkistan have been dated to the era 10,000–7000 B.C. In pictorial representations of various phases of the textile art in Egypt (at Beni Hassan and at other sites) the spindle and the distaff are shown being used in spinning yarn at the time of the Middle Kingdom.

In the early spinning process the raw fiber was placed on a stick or reed (the distaff) held lightly under the left arm or thrust into a belt at the waist. A loose end of the fiber on the distaff was placed between the fingers and then rolled against the thigh until a thread was started. The spindle, to which the thread from the distaff was attached, was 1–3 ft. long and either was notched or had a small hook at one end and, for good balance, a spindle whorl at the other end. To spin yarn the spindle was twirled between the hip and the palm of the hand, during which process the thread became twisted. After the thread was sufficiently twisted the yarn was wound about the other end and the process repeated.

There are no records of the steps that occurred in the evolution of the weaving loom. However, it may be hypothesized that, having learned to make fishweirs and to wattle huts and

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

baskets by interweaving vines and rushes, man adapted this process to the making of textile fabrics by similarly interweaving rows of yarn laid out on the ground in one direction with rows of yarn laid out at right angles in the other direction. Someone then realized that if he hung a log or a beam from the branches of a tree and tied the end of the yarn to this beam, he would be able to produce a much stronger fabric. Later a second, or bottom, beam was added, to which rows of warp yarn, which hung from the top beam to the bottom, were tied. Again after much time had elapsed, upright logs were added to the two sides of the beams of this crude machine and the weaving frame was the result. It was impossible, however, to weave a web larger than the frame; the last important step in the development of the loom, therefore, was the replacement of the two rigid end beams with rollers, thus making it possible, theoretically, for the weaver to weave a web of any length he wished.

No remnants of the cloth made by Neolithic man have survived; but remnants of textile fabrics dating from about 5000 B.C. have been found in Egypt in the Nile Valley areas of Fayum and Badari. These bits of fabric are of linen and are of plain weave, as were all the linens of Egypt and the East until about 2500 B.C.

Loom weights, spindle whorls, and pieces of woven linen cloth made by the people known as the lake dwellers and authenticated as dating from 4500–2500 B.C. have been found in the Swiss mountains, in the village of Robenhausen (canton of Zurich). Pieces of woolen cloth, loom weights, and a corded garment have been found in graves characteristic of the period 3500–1100 B.C. These evidences of man's skill in the textile arts during the Bronze Age have been found in England, in Jutland, in Sweden, and in the other Scandinavian countries.

In Palestine fragments of wool and linen textiles of 3000–1000 B.C. have been found at Ghassel, and needle shuttles from the same period have been found in a cave at Megidd. In Sumeria clay tablets have been found which served as account books for weavers, who seem to have been working at their trade as early as 2200 B.C.

Laws, called "sumptuary laws" and based primarily upon religious grounds, were aimed at controlling the dress of many ancient peoples, especially the Hebrews and the Egyptians. Egyptian priests were forbidden to wear a garment made of wool next to the body; no priest could enter a temple without removing any part of his attire made of wool, and wool was not used in burial garments or mummy wrappings, which were made of linen.

In the Old Testament (Deut. 22:11) "garments of mingled stuff, of woolen and cotton together" are prohibited. The garments worn by the high priest in the holy of holies were prescribed to be made of pure linen. According to Herodotus (I, 195), both the Babylonians and the Assyrians had sumptuary laws similar to those of the Hebrews and Egyptians. These also forbade the use of woolen cloth next to the body. "For their dress," he wrote, "the Assyrians wear a linen tunic. Over this they put a garment of wool."

From Babylon and Phrygia, both ancient seats of weaving, the art of embroidery spread throughout the Western world. So-called "Phrygian dresses" were made with gold fringes and sumptuous embroideries of palm leaves. The whole chiton was sometimes covered with embroidered stars or disks. Women did the embroidery as well as the weaving.

In the Mycenaean age Grecian women wore sewed and fitted dresses adorned with interwoven patterns or attached embroidered borders. From the 12th to the 10th century B.C. the Ionians used principally linen and the Dorians wool as the raw materials for their textiles. In the course of time wool became the rule for male garments throughout Greece. The maidens of Attica were obliged to weave a peplos as an offering for Athena Parthenos at the Panathenaia, which occurred every four years. To the Greeks this peplos was a symbol of the universe, hence every goddess who was credited with creative talents received a similar offering.

Byssus was commonly used for women's dresses (wool, linen, silk, and cotton were all called "byssus," but the term was properly applied only to a fine fabric made from flax). This was the material from which the famous "transparent" dresses of Amorogos were made (see COSTUME).

In the island of Britain, which stood at the limits of Western civilization before the decline of the Roman Empire, the inhabitants, having emigrated from the shores of the Thracian Bosporus, had in the course of their wanderings lost their knowledge of weaving. They covered their bodies with animal skins. The Phoenician traders and merchants who went to Britain for the tin which was so abundant on the coast of Cornwall, taught the inhabitants the technique of dressing wool and flax and the spinning of yarn for weaving coarse cloth. The Britons came to excel in the dyeing of cloth, especially in various shades of blue, for which they used a vegetable dye extracted from woad leaves. The Greek geographer Strabo (63 B.C.?–A.D. 24?) reports that the natives of what is now known as Ireland had long been acquainted with the arts of spinning yarn and weaving cloth and had probably brought this skill with them when they migrated from Gaul.

In Rome, during the period of the Republic, every wealthy household counted among its slaves weavers and tailors who made garments for their masters. The toga was made of various grades of wool and women's undergarments were made of linen, with yarns from Spain, Syria, and Egypt being preferred to those of domestic origin. Just before the beginning of the Christian Era the Romans discarded wool and linen garments in favor of imported silks. Tacitus (*Annals*, II, xxxiii, 1) records the edict of the Roman Senate, in A.D. 16, prohibiting the wearing of silk robes by men in Rome; at that time a pound of silk was sold in Rome for 12 ounces of gold, but the supply increased with the demand and the price diminished accordingly. The emperor Heliogabalus (A.D. 118–222), who came from Syria, was said to have been the first to wear garments of pure silk, for previously silk had been mixed with threads of linen or cotton. In the Edict of Diocletian, issued in Rome in A.D. 301, maximum prices were fixed throughout the Empire for all the necessities and commodities of life. The price of "genuine purple silk" was established at "about ten times that of white silk." A silk weaver received half the pay of a linen weaver, and a tailor received about 50 denarii (half the linen weaver's pay) for cutting and finishing overgarments of the finest quality.

Silk was first introduced into Greece and Rome from the interior of China almost a thousand years before the Christian Era; it had been first cultivated in China during the reign of the emperor Huang-ti (ca. 2640 B.C.). The secrets of sericulture were closely guarded, and the exportation of either silkworms or the mulberry leaves upon which they fed was strictly prohibited and punishable by death. Two Nestorian monks concealed some silkworm eggs in a hollow cane and brought them to Constantinople in A.D. 552. They gave the eggs to the emperor Justinian, who appointed a caretaker for the precious gift; in due time the eggs were hatched and the larvae were fed mulberry leaves, which had also been secretly brought from China. Thus began the history of sericulture in Byzantium and Europe.

Long before color was used in textiles Neolithic man had used color for adornment in tattooing his body. The art of dyeing textiles was well known to the ancient Egyptians, the Hebrews, and other Semitic peoples. The Egyptians used acids and salts in their dyeing processes. The threads were often dyed before they were woven into cloth; many of the Egyptian cloths were made in various patterns worked in colors on the loom. These patterns were so clear and distinct that Martial (*Epigrams*, VII, LVI) said, "They vie with the Babylonian cloths embroidered with the needle." The Phoenicians, however, were considered the most expert dyers of all the ancient peoples and were credited with having discovered the art of making purple dyes from certain mollusks found in the Mediterranean on the coast of Tyre and other nearby areas of the Phoenician shore. The word "purple" at that time described a whole series of colors in the red-blue range.

Double-dyed purple silk or woolen dresses were considered a luxury. In Rome cloth of Tyrian or Laconian origin fetched the highest prices, a pound of Tyrian-dyed wool being sold at

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

1,000 denarii, while a pound of ordinary purple-dyed wool sold for much less. In Rome the wearing of the true double-dyed purple cloth remained the exclusive privilege of emperors. Women were punished for wearing double-dyed purple clothing, as was any merchant who trafficked in it.

Democritus of Ephesus (460?–362 B.C.?), in the first of his two books on the Temple of Ephesus, wrote: "And as for the violet and purple robes of the Ionais, and their saffron garments embroidered with round figures, these are known to everyone. The caps they wear on their heads are embroidered with animals. The long robe they wear, called an 'actmea,' is the most costly of all the Persian articles of dress. It is woven for the sake of firmness and strength, and is ornamented all over with golden millet grains, all the grains having knots of purple thread to fasten them in the middle" (Athenaeus, *Deipnosophistae*, XII, 525c). Pliny mentions cloth interwoven with gold thread and cloth woven entirely of gold thread, without any woolen or linen ground. The garments of Agrippa, the tunic of Heliogabalus, and those worn by Tarquinius Priscus are supposed to have been made in this manner.

According to the notions of aristocratic Romans, the plying of trades and handicrafts was beneath the dignity of the free citizen. Rome largely subsisted on the industry of thousands of slaves and freedmen who were the chief tradesmen and mechanics; the former supplied the various requirements of the households, the latter worked for payment and sold their wares in shops. Freedmen practicing the arts of spinning, weaving, and dyeing were organized and had their headquarters in the so-called "Temple of Minerva Medica" on the Aventine. They ultimately acquired great power and are considered to have been the forerunners of modern trade unions. They had statutes, rules of membership, collective and individual privileges, and widows' funds. The origins of these guilds of artisans have been traced back to the time of Numa Pompilius, second of the legendary kings of Rome, who reigned about 700 B.C.

During the late-antique period and the early Middle Ages skill in creating textiles continued to grow in what had been the Roman Empire; sericulture in particular was highly developed, and the Italian products soon surpassed those of Byzantium in excellence of manufacture. Italian looms, and especially the silk-spinning machines, were of the greatest importance in fostering the economic development of Italy during the Middle Ages.

Milton N. Grass

Techniques and materials. Structurally, textiles are plaited threads. Cloth is an interlacing of one series of threads, the warp, at right angles with another series, the weft. The weft always runs under one thread and over one or more, depending on the kind of weave, and always crosses from one selvage to the other. Depending upon weave and pattern, the warp threads are lifted by strings so that the shuttle can pass between them, and then lowered again, always in continuous alternation. The simplest weave is the plain (linen) weave, in which the weft passes over one warp thread and then under the next. In the twill weave the first weft passes over the first and second, then fifth and sixth, warp threads, and the second weft passes over the second and third, then sixth and seventh, warp threads, so that diagonal lines or ribs appear in the woven material. In the satin weave the wefts are passed over several warp threads while those passed back under are so distributed that the surface of the cloth is very tight in texture. This weave is particularly adapted for bringing out the luster of silk.

In tapestry the wefts are drawn through the warp threads with a needle, under one thread and over one or more others. But they are drawn through only in accordance with the pattern requirements, the thread then being left loose and fastened on the back. Embroidery requires a foundation weave in linen, cotton, wool, or silk into which the threads are let in various stitches (cross-stitch and stem, chain, braid, feather, and darning stitches), usually following a drawing, with a needle. The embroidery may be enriched by the application of colored cloth, metal paillettes, sequins, or beads.

Lace is an artistic plaiting of freely moving threads on one surface. Lacemaking is a relatively modern (late Renaissance) technique, but the other textile techniques are very old.

Linen seems to have been the preferred material along the Nile, cotton along the Indus; wool was used at an early date, first in a tuft-weaving, later in a loop-weaving technique, similar in effect to the pelt of an animal. Silk filaments, the noblest raw material for textiles, surpasses in length, fineness, and the ability to take dye all other textile materials. Silk thread comes from the cocoon of the larva of the bombycid moth (*Bombyx mori*). From two glands the silkworm secretes a soft substance (which hardens on contact with the air), the innumerable windings of which form a cocoon in which the caterpillar changes into a chrysalis. Reversing the process, the cocoon can be unwound like a spool into silk threads over 2000 yd. long.

An important material in textile art, the gold thread used in brocading and embroidery consisted in antiquity of a linen core wrapped with thin strips of pure gold; in the Middle Ages beaten gold leaf on gut was cut into thin strips and wrapped around a linen or silk core. In the papal inventories these gold threads were listed as *aurum battutum* or *aurum de opere cyprense*, the latter probably because the main center of production was on Cyprus. In later times the thread was gilded silver lamé with a certain percentage of copper added.

The oldest examples of textiles with an artistic intent were found in Egypt. These include a linen textile with tapestry-woven lotus flowers, a garment of Amenhotep II (18th dynasty, 1555–1350 B.C.; Cairo, Egyptian Mus.); the girdle of Ramses II (19th dynasty, 1292–1225 B.C.; Liverpool, Walker Art Gall.); and a rug from the tomb of Kha (18th dynasty; PL. 3). Paintings also testify to ancient weaving activity, as seen in the clothing of Jewish women on the walls of grave 3 in Beni Hassan (12th dynasty, 2000–1790 B.C.) as well as in textile patterns in frescoes in Crete and Tiryns (middle of the 2d millennium B.C.). The tufted kilts of the Sumerian kings (ca. 3000 B.C.) and the garments decorated with embroidery and tapestry work, such as that of King Marduk-nadinakhe of Babylon represented on a boundary stone or that of the dress of Ashurnasirpal II on the reliefs from Nimrud (both, Br. Mus.), can also be taken as documents for an ancient tradition.

Heinrich J. Schmidt

The ethnological world. While the prehistoric civilizations of Eurasia were acquainted with weaving as early as the neolithic age, as is documented by finds of spindles and spindle whorls, in ethnological cultures the agricultural peoples do not always practice this art. On the other hand, it is found in some genuine pastoral or hunting and gathering cultures, as well as in preagricultural levels of the Basket Makers (southwest North America) and the Huaca Prieta (Peru).

It seems difficult to document the diffusion of weaving from a single center of origin. An origin independent of the Old World must be postulated at least for the pre-Columbian American civilizations, while for Oceania a derivation from the cultures of southeastern and insular Asia is a highly probable hypothesis.

Unlike other techniques present in ethnological cultures, such as the preparation of tapa (q.v.) or the confection of mats and baskets (see BASKETRY), which require no special equipment, weaving requires tools which, even in their most simple and rudimentary form, are highly specialized and limited to this technique: spindles, spindle whorls, and looms — the latter with the relative equipment. Moreover, while the diffusion of plants, leaves, and cane suitable for the manufacture of plaitwork is almost universal (with the exception of arctic and desert areas), the presence of the cultivated or wild fibers and of the fleece or animal hair suitable for weaving is much more limited and, at least in a few cases, has determined the presence or absence of weaving in a given area. There are also other factors, such as climate, which in certain cases permits complete nudity or very light covering and in others, such as the Arctic, demands heavy clothing. Also determinant is the prevalent form of economy, which defines the nature of the group, and, finally and above all, there is tradition, which requires a specific type

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

of dress. With the usual exceptions, weaving appears in various stages of development among almost all the ethnological peoples having an agricultural economy, with the exception of the greater part of the Melanesian and Polynesian archipelagoes, where its absence was the result of the lack of suitable materials, the diffusion of tapa clothing, and the generally mild climate of the Pacific. In fact, the Maori of New Zealand, when faced with the harsh climate of their mountain island, invented weaving, using a type of local flax.

It is unusual to find weaving among hunting and gathering peoples or pastoral peoples. Among the former are the Tlingit of the northwest coast of North America, who were able, because of an abundant food supply (fish), to settle down with enough leisure time for the crafts. The famous Chilkat blankets (see NORTH AMERICAN CULTURES; X, PL. 360), made by a Tlingit subdivision, are woven by women on an incomplete loom with mountain-goat wool and cedar fibers. This technique is used to produce complex decorative motifs representing totemic animals and myths in the style typical of the northwest American coast. The Ainu of Japan, lesser fishermen and hunters, wove elm fibers (which did not have to be spun) or nettles on a horizontal hand loom with various peculiarities that seem to indicate its local invention. Among the pastoral peoples pelts and felt are generally preferred as the basic materials from which to make articles of clothing. However, even here there are exceptions, as among the Somali and the Galla (PL. 1; IV, PL. 90) and among the Ostyaks of Siberia.

The search for suitable materials for weaving has resulted in many fabrics that attest to man's ingenuity. These have been made from wild-plant fibers (agave used by the Mexicans, wild cotton in some of the areas of the Amazon, elm and nettle fibers among the Ainu, cedar fibers among the Chilkat, raffia in central and west-central Africa, wild flax among the Maori) in addition to those made from the more ordinary cultivated fibers.

Once the material has been obtained, it must be made into filaments and woven. Among the ethnological peoples this is generally done on a hand loom, that is, one without a foot pedal or treadle. However, the primitive state of the tools used in weaving has not been an obstacle to the production of cloth of high quality. With the simplest of looms Peruvian weavers produced some of the most elegant and perfect textiles the world has known.

Textiles were decorated in different ways, either directly on the loom, by varying the colors and fineness of the filaments of the warp and weft, or by decorating the finished material by dyeing, painting, stamping, or embroidering it.

The technique of embroidery is less diffused than weaving and is not always bound to the decoration of textiles. The Siberian peoples embroidered, often elaborately (XIII, PL. 32), clothing of felt, skin, or fur. The same is true of the fur costumes of the Eskimo (IV, PL. 8), while the Iroquois, Ojibwa, and other Indians of the eastern United States decorated not only their clothing but also cradles, saddle bags, and quivers with porcupine-quill embroidery (X, PL. 363). This type of embroidery disappeared with the arrival of the Europeans and was widely replaced by bead embroidery in which floral motifs, clearly European in derivation, were added to the traditional motifs (IV, PL. 11; X, PL. 362). In Africa excellent examples of embroidery on raffia mats, the so-called "Kasai velvets," were made by the Kuba and Bushongo tribes, using abstract motifs symbolizing clouds, grasshoppers, and various animals (see BANTU CULTURES; II, PL. 116). The designs embroidered on the "bubu" of the Hausa (see SUDANESE CULTURES) are also very fine. They correspond to local motifs and symbols, but many are clearly of Eastern derivation.

Despite their appearance, the so-called "gauzes" found fairly frequently in the funeral wrappings of the pre-Inca coastal civilizations of Peru are not lace but are made by crossing or intertwining two or more weft threads which are then fixed by a warp filament. Genuine lacemaking seems to be absent from the ethnological areas.

There was no weaving among the aborigines of Australia, but sometimes human hair was used for making belts and ornaments, employing the system of plait weaving (so-called "finger weaving"), which represents a sort of transition between plaiting and genuine weaving.

In Africa weaving reached a high technical level. Seven different types of loom are used, two of which, the so-called "Hindu" loom and that known as "Mediterranean," were undoubtedly imported. Besides the previously mentioned "velvets" of the Congo, attention should be called to the multicolor textiles of the western Sudan (Bambara, Dogon, Sarakole), often obtained with resist-dyeing methods; the Javanese batik technique (see below), diffused among the Yoruba of Nigeria; and a method of decoration peculiar to the Ashanti of Ghana, called *adinkira*. This consists of printing decorative motifs in black by means of a stamp (made from a squash) on cloth of white or unbleached cotton. These motifs each have a name, corresponding not to the object represented but rather to historical events, myths, or allegorical symbols. In Ghana, particularly among the Ashanti, the Dutch introduced silk, from which beautiful multicolor striped cloaks were made.

Among the Asian peoples on an ethnological level, weaving is sporadically practiced in Siberia — among the Goldi and the Ostyaks, for example — as well as among the Ainu of the Japanese archipelago. Among the last-mentioned people, the rich embroideries covering the textiles are of greater interest than the textiles themselves. The motifs are typical of local art but have an affinity with various Chinese decorative elements (XIII, PL. 27).

Among the "primitive" groups of India and Indochina (I, PL. 498) weaving is quite highly developed, particularly in Laos and Cambodia, without, however, arriving at the refinement and variety of Indonesian weaving (see below). In addition to the decoration of textiles on the loom with simple geometric motifs or with regular bands of multicolored borders, decoration with embroidery is fairly common. In addition, buttons, sequins, and silver ornaments are frequently applied to the cloth. In Indonesia (see INDONESIAN CULTURES) and the neighboring archipelagoes (see PHILIPPINES) weaving and textile decoration reached a high level. The production of brocades, lamé, and silks as well as the use of specific resist-dyeing techniques seems to be of Indian derivation, or at least to derive from the Hindu culture of continental Asia.

The Indonesian looms, divisible into three main types, are diffused, with local variations, in regions lying as far apart as America and Japan (the Ainu), Burma (the Karen), and Malaysia, and Micronesia. The diffusion of the three main dyeing techniques (batik, *ikat*, and *plangi*) is almost equally widespread. Batik is a Javanese term indicating a system of application of decorative motifs by dyeing the finished cloth. The parts which are not to be dyed are covered with wax or a similar moisture-resistant material. In Java, where the batik technique seems to have spread in post-Islamic times, the tjanting, a special instrument for pouring the wax, which permitted innumerable variations of the preserved motifs, was invented in the 17th century. Resist-dyeing techniques which can be traced back to the Javanese batik are widespread in Madoera and are also scattered here and there in India, Thailand, Turkistan, China, Japan, and Nigeria (the Yoruba).

Ikat, another resist-dyeing technique, was much more widely diffused. It probably penetrated Indonesia with the Dong-s'on culture. In *ikat* the resist is applied to the filaments before they are woven. There are three main variations: that in which the resist is applied only to the warp (found among the more "primitive" Indonesian groups — Batak, Dayak, Toradja, VIII, PL. 41; and the most perfect works from Sumba, VIII, PL. 40); that, found only in southern Sumatra, in which the resist is limited to the weft; and a third, with both warp and weft resist-dyed, confined to a mountain village in Bali (VIII, PL. 40). The most varied decorative motifs, geometric or figural, can be made in batik as well as *ikat*. They are often connected to religious or mythological symbolism. Outside Indonesia and Madagascar, where it was undoubtedly introduced from Indonesia, *ikat* is diffused in Mali and along the Gulf of Guinea, through Islamic contacts, as well as in pre-Columbian America.

Plangi, a word of Malay origin, is said to mean "polychrome spot" or "spot with resist." The technique is a tie-dyeing

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

method in which parts of the cloth on which isolated motifs have previously been drawn or printed are tied, thus making those parts impermeable to the dye. At present, as with *ikat* and to a lesser extent with batik, *plangi* is in decline. The diffusion of chemical dyes and European textiles has led to the decline in many places of the old traditional techniques. *Plangi* and techniques similar to it are, however, found in many places in Africa (PL. 1) and in the Americas.

In Oceania, mention should be made of New Zealand Maori weaving, which represents a local development of the plait weaving used by the Polynesian islanders to make nets. The decorative motifs are obtained directly on the fabric, either by using colored threads or by varying the number of crossings.

Weaving was widespread in pre-Columbian America from ancient times. It appears in the preagricultural archaeological levels, in the fishing cultures (Chilkat), and among the lesser agricultural peoples of Amazonia and the eastern slopes of the Andes (particularly among the Peruvian and Ecuadorian "Untana" tribes), as well as among the peoples of mixed economy and at a high level among the agricultural peoples of the Mexican-Andean civilizations.

Before the arrival of the Europeans weaving was widely practiced among the Pueblo peoples, but it gradually declined to the point of disappearing almost completely. The techniques and decorative motifs of Pueblo weaving, however, were kept alive by a neighboring people of completely different ethnic and cultural origins, the Navaho of Arizona. After the arrival of the Spaniards, who introduced sheep into the area, the Navahos were transformed from an agricultural and hunting people into sheepherders; during the 17th century they learned to weave on an incomplete vertical loom, moving from bottom to top. Their blankets, usually of the colors of the natural wools with vegetable dyes of reds and, more rarely, blues added, were decorated with prevalently geometric motifs woven into the field.

In Peru the favorable climatic conditions of the desert coast permitted the preservation of many textiles, but of the textile production of ancient Mexico nothing has remained. Sculpture and painting, however, show that the early inhabitants of Mexico and Central America had reached a high level in the textile arts, even though clothing was generally rather limited and feathers were used a great deal. The most common material was the fiber of the agave plant, which after its preparation was carded and woven on a simple girdle-back horizontal loom. Netlike fabrics as light as veils (reserved for high dignitaries) were made on these looms. The decoration, more often abstract than figural, generally indicated the rank of the wearer.

Tombs excavated in Peru have provided a great number of almost intact fabrics that were used as mummy wrappings. The finest and most varied examples are from Paracas, along the southern coast of Peru. There, beginning with the 7th century, wool (llama, alpaca, and vicuña) and cotton fabrics were produced in various techniques: tapestry and its variants, rep, twill, brocade, tubular and double textiles, gauzes, openwork fabrics, and plait-woven fabrics. The use of color in these fabrics is rich and harmonious. Particularly fine are the simple fabrics embroidered with an astonishing variety of subjects: anthropomorphous figures, monstrous and fantastic animals, birds, and reptiles. Equally noteworthy are the embroidered borders of the great funerary mantles (I, PLS. 182, 183) representing anthropomorphous figures and sometimes charming little birds in trees; these borders recall crochet in their effect. Tapestry-type textiles also come from other regions and belong to other artistic styles — Tiahuanacan and Incan from the central coast (I, PLS. 170, 172), and, from the north coast, textiles in painted cotton or decorated with feather mosaics (PL. 2; I, PL. 171; V, PL. 269), which reached a particularly high level. The same can be said for textiles of Nazca style (I, PLS. 181, 184; V, PL. 271).

An amazing variety in texture was achieved by adding supplementary warps and wefts, by changing the colors of the filaments, by mixing wool with cotton, by crossing or plaiting two or more filaments, of the warp as well as the weft (the famous "gauzes" were made in this technique), by creating decorative slits in the fabric, and by adding to the finished cloth pompons, appliqué, embroidery, painting, and small plaques of metal. Double weaves, the "pseudo-velvets," were also made. In the more primitive and archaic methods of plait weaving and crochet, belts, fringes, ornamental borders, coca bags, slings, collars, sandals, hoods, and various types of fishnets were made. Among the various embroidery stitches used, the buttonhole stitch and satin stitch can be distinguished.

The resist-dyed Peruvian textiles did not arrive at the perfection of color found in the Indonesian ones made in the same way, but taken as a whole, the pre-Columbian Peruvian textiles represent the highest achievement of the textile production of the ethnological world.

Ernesta CERULLI

TEXTILES. *Alexandria and Byzantium.* It seems proper to begin a survey of the historical development of the textile arts in the West with the last heirs of Greek culture, Alexandria and Byzantium, where East and West meet. The Egyptian city named after and founded by Alexander the Great was a citadel of Greek learning and art as well as of Christian theology. With the Copts, who adopted Christianity relatively early, Roman imperial art (q.v.) took on a unique provincial form (see PROVINCIAL STYLES) in which influences from ancient Egyptian, Syrian, and Italian art were amalgamated, but with the native Coptic style always dominant. It is often pointed out that the result of this synthesis was purely Eastern in character; and while it is true that Greek and Roman realism unquestionably gave way to the two-dimensionality of the Eastern styles, it must not be forgotten that many forms, such as the acanthus-leaf motif and the figural representations from Greek and Roman mythology, coexisted with the plant and animal ornament of the ancient Eastern cultures — the tree of life, the lotus, the ibis, the zebra, the affronted horsemen (PLS. 5, 6). Some early representations of Biblical or folk tales (Daniel in the lion's den, the shawm player) reveal stylistic advances very like those, based on late-antique art, that later appeared in Europe (see COPTIC ART; III, PLS. 449, 450, 458).

The Byzantine culture was the last legacy of the Greeks and Romans to the Western world. Under Constantine the Great Byzantium became a Christian Roman kingdom of Greek culture; it included countries of the Hellenistic East and eastern Europe, and its influence was strong in the former Greek colonial territory in southern Italy and Sicily and extended to Ravenna. Up until the sack of Constantinople by Enrico Dandolo in 1204 Venice remained completely under the influence of the metropolis on the Bosporus. For more than a thousand years, from the 4th to the 15th century, the Byzantines held off the Goths, the Huns, and Islamic invaders but at the same time formed a bridge to Europe, where Byzantine influences were particularly evident in the textile arts. Through the commerce in reliquaries costly Byzantine silks that served as corpse wrappings reached many Western church treasuries (Rome, Milan, Trier, Cologne, Aachen, and others). In the Sens Cathedral Treasury is a textile with maenads and a bowman who is being torn asunder by leopards. Another, with a Greek inscription, represents the story of Joseph. It is assumed that these textiles were woven in workshops in Alexandria, the citadel of Hellenism. Of particular importance is a purple silk (PL. 11), probably Alexandrian, in which scenes showing the Annunciation and the Nativity are enclosed in large roundels. The silk hangings of the early Christian churches, mentioned in the *Liber pontificalis romanus*, must have been like this one. A silk textile with a quadriga in Aachen (Cath. Treas.), as well as the designs of youths with victory wreaths and whips, seems to have some connection with the imperial hippodrome in Constantinople. This city became one of the largest production centers for silk textiles, an activity both important and lucrative in world commerce. The Byzantine emperors set up state workshops (*gynecaliae*) in Constantinople; most of the weavers were women. These workshops had existed in the 4th century, but it was not until Justinian's time, when the production of the raw material became possible in Byzantium, that they really flourished. When he built Hagia Sophia Justinian acquired silk fabrics for the church from Alexandria, probably intending them to serve as models for native weavers. In the early Middle Ages establish-

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

ments for the weaving and diving of silk also existed in Corinth, and in 1170 Benjamin von Tudela reported that 2,000 Jewish silk weavers and purple-dyers lived in Thebes.

In Byzantine silk textiles, influences from the ancient Orient and from Iran were revived (PL. 6), with the lions of the Ishtar Gate in Babylon and the animals, such as elephants, ibexes, and lions, of the hunting scenes on the Sassanian rock tombs (Ṭāq-i-Bustān) appearing in many textiles. In Charlemagne's tomb in Aachen a silk with large elephants in circles was found, the Greek inscription thereon indicating that it was woven in the 10th century. It therefore seems plausible that Otto III, whose mother was the Byzantine Princess Theophano and who had Charlemagne's grave opened, placed it there. In the St. Anno reliquary of Siegburg Abbey and in the Heribert shrine (ca. 1170, Deutz, St. Heribert) are silks with lions in solemn procession. According to the names of the emperors (Romanus I and Basil II) in the Greek inscriptions, they must have been woven in Byzantium between 921–31 and 976–1025.

The purple-dyed silks with large single- or double-headed eagles, sometimes holding lions in their claws, were probably reserved for the emperor himself and for the highest dignitaries; but they also found their way into European countries and were used in church vestments, examples having survived in the church of Bressanone (Italy), in St. Peter (Salzburg), in St. Knud (Odense, Denmark), in St-Eusèbe (Auxerre), and in the Vich Cathedral (Spain). Shortly after the year 1000, close contacts with Asia Minor, Syria, Iraq, and Iran led to the appearance in Byzantine textiles of decorative motifs such as those that had first appeared in the stuccoes of the caliph's residence in Samarra (as forerunners of the arabesque), as well as the lively plant and animal forms of Seljuk descent. The designs of one group of these textiles, consisting of linear plant motifs enclosed in circles or pointed ovals, are so close in style to the stucco decoration of Samarra (VIII, PL. 151) that they have been considered Islamic art. The chasuble of Archbishop Willigis (d. 1011; Mainz, Cath. Treas.) is an example of these textiles. The Islamic influences of Seljuk art led to the use of a style of plant and animal ornament full of movement, which was basically foreign to the rigid style of Byzantine art.

By the 14th century Byzantine art began to exhaust itself. True damask, which probably takes its name from the city of Damascus, since such fabrics were either woven in or exported via this city, seems to have been little used, if indeed it was even introduced into Byzantine workshops.

Italy. Just as in the East the revival of the textile arts in the Middle Ages took place in former Greek and Roman areas of dominion on the Black Sea, in the West it came first to Sicily, a former Greek colony temporarily annexed to the Byzantine and Arabian dominions.

As in architecture, Byzantine and Islamic influences reached an interesting synthesis in Sicilian textiles. Beginning with the 6th century B.C. the island had belonged to the area of Greek and Roman dominion; from the 6th to the 9th century of the Christian Era it was Byzantine; from the 10th to the 11th century it was under Moslem rule; and from the 11th to the 13th century it passed from Norman to Swabian and then to Spanish domination. There was a court manufactory under the Normans in Palermo, as shown by a fragment in Hannover (Kestner-mus.) with the inscription *operatum in regio ergasterio* ("made in the royal workshop"). A silk brocade from the tomb of the Hohenstauffen emperor Henry VI (d. 1197; Br. Mus.), who married Constance, the last of the Norman princesses, clearly shows influences from Fatimid Egypt. In Sicily there was a highly developed production of borders woven in gold thread. These were exported to many towns throughout Europe.

Lucca was a particularly important textile center in the Middle Ages. Judging from early fragments such as a silk twill which was used as a lining for the chasuble of Bernardo degli Uberti (d. 1133) in Sta Trinità, Florence, binder-warp silk weaving reached its zenith in Lucca in the so-called "diasprum cloth" (a tabby cloth with a binder-warp). In 1315 the Guelphic Lucca was conquered and plundered by the Pisan Ghibellines, and many Luccan silk weavers fled to settle in Florence, Venice, Bologna, and other cities where similar silk fabrics were woven, thus complicating classification. Silk weaving was later revived in Lucca and continued into the 18th century. At the end of the Middle Ages about 3,000 looms are said to have been in operation there. In 1440 the export of 360,000 pounds of silk for a sum of 500,000 soldi is reported. Like Florence and Venice, Lucca had commercial offices in Palermo, Alexandria, Aleppo, Byzantium, and cities on the Black Sea. In addition to raw silk, silk textiles were imported from eastern Asia, Persia, Syria, and Egypt, and as a natural consequence, this led to the adoption of Islamic motifs such as the lotus, arabesques, hunting animals, Eastern mythological beasts, Arabian script, and a free arrangement of designs over the surface (PL. 7). Italian colonies in which Luccan silk merchants played an important part existed in Paris, Antwerp, Bruges, and other cities in northern Europe. Giovanni Arnolfini, representative of a silk house (Cenami?) in Lucca and revenue adviser to Philip the Good of Burgundy, was important enough to have had his wedding portrait with his wife, Giovanna Cenami, painted by Jan van Eyck (V, PL. 223).

Silk textiles from the church treasuries in Sitten (Valeriakirche) and Saint-Maurice, in Valais canton, Switzerland, as well as the many representations of silks in paintings by Tuscan (VIII, PL. 193), Sienese (IX, PLS. 336, 338, 339), German (VI, PL. 127), and Dutch (V, PLS. 278, 279) painters are important in the documentation of the early Luccan silks. In the ornamental motifs and in the representations of fabulous beasts the late Gothic tradition persevered; some patterns, such as lions next to the tree of life, were eventually copied in mosaic pavements such as that of S. Miniato al Monte (Florence). In the 17th and 18th centuries damasks were also woven in Lucca for wall coverings and other purposes.

A black-and-gold brocade from a catafalque cover in the church treasury of St. Mary of Gdańsk (Danzig) can be attributed with relative certainty to a Venetian workshop. From the early Middle Ages merchants in Venice had close rapport with Byzantium and the trade cities of Asia Minor, Iran, and Egypt, and later Marco Polo established communication with China from Venice. The silk vestments in the tomb of Cangrande I della Scala in Verona (PL. 16), like those in the church treasury of Regensburg Cathedral, of St. Mary of Gdańsk, of Stralsund, and elsewhere may well have been imported from Venice. Probably Islamic and eastern-Asian plant and animal ornament was directly taken up by the native textile art. The Italian silk weavers also partially enlarged their technical means through influences from the Near East. The "diasprum cloth" of Lucca is a double-woven textile similar in principle to the Persian textiles, and the gold brocading originally used in this type of cloth later came into more general use.

In the 15th century velvet weaving was introduced into Venice. Velvet is basically a fabric intended more or less to imitate the fur of an animal. Slackly twisted silk threads looped over a wire (*Flosseide*) were used as warp; when the wire was pulled out after the introduction of the weft, small loops remained, that, particularly when cut, gave an effect of fur. Velvet pile may vary in height, permitting a relief-like effect, which can be enriched by being "carved" (Fr., *ciselé*). In these ciselé velvets both cut and uncut pile can exist side by side. One of the oldest extant velvets is said to be that of a 14th-century choir cloak (*cappa*) in the church of Mount St. Mary, Chesterfield, England. Some early accounts seem to suggest that velvet fabrics existed in the early Middle Ages, but this was a confusion with loop-woven cloth. It is not known whether velvet weaving originated in Iran, in Turkey, or in Venice.

Just as 14th- and 15th-century silks had appeared in the paintings of European masters, so did velvet take its place in the works of such great 15th-century painters as Jan van Eyck of Bruges, Stephan Lochner of Cologne, Masaccio of Florence, and Giovanni Bellini of Venice. The Italian painters Pisanello and Jacopo Bellini made designs for silk and velvet textiles, the former in the Codex Vallardi (Louvre), the latter in his sketchbook (Br. Mus. and Louvre). One of the favorite patterns for cut velvet was the pomegranate (PL. 20), which replaced the

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

once-popular lotus blossom. Venice and Florence were particularly important in velvet weaving.

Jacques de Saiges, a French pilgrim who traveled to Jerusalem via Italy in 1528, recorded that there was a thriving textile art in Florence at that time. One of the missions sent by the city of Florence to a Mameluke sultan in 1422 for the purpose of exporting wool cloth directly to Egypt (and not by way of Venice) included the great merchant Felice Brancacci, who on his return in 1423 commissioned Masolino and Masaccio to do the frescoes in the Brancacci Chapel of S. Maria del Carmine. In the 15th century Florence was already famous for artistic borders, or galloons, in which the design in gold, generally on red ground and occasionally on yellow or green, was emphasized by a light-blue edging. Faces and hands were done in white silk. These served as appliqués for ecclesiastical vestments in which the Annunciation, the Resurrection, the Assumption of the Virgin, and Christ's encounter with Mary Magdalene were favorite themes. Unquestionably influenced by contemporary painters, these themes were in turn reproduced in paintings (e.g., in Perugino's *Virgin Enthroned between Saints*, ca. 1496; Vat. Mus.).

Damask and velvet were also made in Florence. If conclusions can be drawn from the paintings of Andrea del Castagno, Domenico Veneziano, Ghirlandajo, and others, the designs were particularly fine. There is a velvet brocade in Florence (Mus. Naz.) bearing the crest of the Medici. In 1475 Pope Sixtus IV had an antependium in gold brocade with gold and silver nubs woven for the Church of St. Francis, Assisi. Probably after a design by Antonio Pollaiuolo, it shows oak leaves and scrolls surrounding the heraldic symbol of the Rovere, an oak tree, set into a field delimited by a dense oak wreath. From the 16th to the 18th century hangings of silk damask and velvet were woven in Florence, Lucca, Venice, Milan, and Genoa (PLS. 21, 22, 25). It can be assumed that a silk with the alliance arms of Beatrice d'Este and Lodovico il Moro and a velvet brocade with the crest and arms of Princess Bona of Savoy, Duchess of Milan, were made in Milan. The Venetians Giorgione, Titian, and Tintoretto were particularly fond of the textures of damask and velvet.

Despite the sack of Constantinople by the Turks and despite the transferal of world trade routes to the Atlantic as a result of the discovery of America, the Venetians, by clever dealing with the Mameluke sultans in Cairo and the Turkish sultans in Istanbul, managed to maintain some of the old trade routes to Asia Minor and Egypt. The highly prized velvet brocades from Turkey and Iran influenced the Venetian weavers, who produced charming variations on the arabesque. As in Florence, Venetian velvets decorated with trophies and other motifs were used as hangings in front of columns and occasionally were copied in stucco.

In the 17th and 18th centuries textile patterns were enriched by long feathery leaves, exotic flowers with deep calyxes, and cornucopias with blossoms. *Chinoiseries* were popular, as were patterns with strange abstract motifs. These were called "Indian carpets" and are probably to be traced to the influence of the contemporaneous Indian silk fabrics. In the meantime France had replaced Italy as the leading producer of silks.

Spain. Spain too, before its conquest by the Arabs, had been under Byzantine domination and was therefore influenced by Byzantine culture. Although the expulsion of the Arabs began in the 10th century, they kept a foothold until 1492 in the south of the peninsula, particularly in Granada. Moorish art on Spanish soil, including weaving, is purely Islamic in character. A silk textile with elephants enclosed in medallions (León, Cath. Treas.) has an Arabic inscription in Kufic script that represents it as having been woven in Baghdad, but it has been unequivocably proved to be of Spanish creation. Written sources declare that Almería produced silk textiles just as good as those woven in Persia. In a textile with lion-stranglers (PL. 7) and in another with sphinxes, influences from ancient Iran seem to have been revived. The Byzantine-Greek inheritance was also active in Spain, as can be seen in the silks with double eagles in Lyons (Mus. Historique des Tissus) and from Quedlinburg (Berlin, Staat. Mus.) and in that with harpies and peacocks in the Cathedral Treasury in Vich. After the reconquest of Spain many Arabs, including weavers, remained there. At first all these Moorish craftsmen naturally continued weaving their old patterns, changing them only gradually to fit European tastes. Silks that have come to light in the tombs of the Spanish kings in the Cistercian monastery of Las Huelgas, near Burgos, are examples of these: among them are silks and half-silks with confronted lions in roundels; and a lion on a silk brocade with decorative Kufic writing, from the tomb of María de Almenar (Las Huelgas, Mus. de las Ricas Telas), can be compared with the lions on the silk with the name of the Seljuk sultan Kaykubad in Konya (Lyons, Mus. Historique des Tissus), while others from Spanish tombs recall the lions on silks from Regensburg as well as those on Italian silks. Particularly characteristic of the Hispano-Moresque silk textiles are geometric plait-band patterns in the so-called "Alhambra" style, after corresponding stucco and tile patterns (PL. 9) in Granada. In textiles as in ceramics, relationships with Italian workshops are evident. In the 15th and 16th centuries heavy gold and velvet brocades were also produced in Spain, with the pomegranate appearing next to the typically Turkish tulips and arabesques. In the portrait by Bronzino, Eleanor of Toledo wears just such a velvet brocade dress.

Whereas in the Middle Ages silk manufactories existed in Almería, Seville, and Granada, later the most important workshops were in Valencia and Toledo. In the 18th century most of the silk textiles used in Spain were imported from France.

France. The zenith of French silk weaving was reached in the baroque period, although an "Ordenance du mestier des ouvriers de drap de soye de Paris" had existed since 1260 in Paris. The Parisian borders with simple scatter designs of leaves and flowers and the silks with simple, finely engraved drawings of animals (birds, griffins, etc.) and with leaves and flowers, particularly lilies, were favored. In 1466 King Louis XI promoted the establishment of silk manufactories in Lyons and in 1470 did the same for Tours so as to bind them more closely to the royal court. At first the manufactories employed Italian workers. The early products, up to the middle of the 17th century, were almost all copies of the Italian models from Florence and Genoa, as is evidenced by a silk of 1363 in Lyons (Mus. Historique des Tissus). The French kings — Henry II, Henry IV, whose wife Marie de Médicis had close contacts with the Italian manufacturers, and Louis XIV — contributed to the development of silk weaving through tax exemptions and other privileges. By the Edict of Nantes, 1598, Henry IV gave freedom of worship to the Huguenots, among whom there were many weavers. Under Louis XIV and his minister Colbert, who was famous for the introduction of the mercantile system, native crafts, including silk weaving, took a decided upswing. After the founding of the Manufacture Royale des Meubles de la Couronne, only nationally made furniture and silk fabrics could be obtained. The growth of exportation, aided by propaganda for French fashions, helped obtain commissions for the art trade, with the elegant court of Louis XIV serving as model for all the courts of Europe. Technical and artistic inventions contributed greatly to the consolidation of the powerful position of the French manufactories. In 1605 Claude Dangon built a loom in which the number of heddles for lifting the warp threads was raised from 800 to 2,400, thus greatly increasing the possibilities for wefts of various colors and gold brocading. The silk manufactories not only provided articles of wearing apparel but also furnished the royal French palaces with wall panels, hangings, and upholstery. While the 1665 inventory of the French Crown listed mainly brocades from Florence, Milan, and Venice, after 1667 most of the silks were obtained from Lyons.

The extremely unwise revocation of the Edict of Nantes by Louis XIV in 1685 induced many silk weavers to emigrate, particularly to England, to Holland, and to Germany. In Lyons, between 1685 and 1762, the number of weavers shrank from 12,000 to 3,000. Following technical improvements in the loom by Jacques Vaucanson and J. M. Jacquard, and with the em-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

ployment of such artists as Simon Vouet, Claude Bérain, Daniel Marot, Jean Revel, Jean Pillement, and Philippe de Lasalle as designers, French silks commanded an outstanding position in the world. The painters of the period, such as Jean Antoine Watteau (PL. 406), Jean Baptiste Monnoyer, Charles Lebrun (IX, PL. 102), Hyacinth Rigaud (V, PL. 406), and François Boucher (II, PL. 334), in whose paintings the costly silk brocades appeared in their full charm, were of great importance in the development of French silks.

Exotic fusions of lotus, pomegranate, and lily, often with cornucopia-like calyxes, made their way into the patterns. Crowns and fleurs-de-lis (PL. 25) frequently appeared in silk and velvet brocade wall hangings. Particularly popular were lace patterns, drawn from the countless examples of real lace. Under Louis XV brocades continued to be used for clothing and hangings.

Daniel Marot (1663–1752), an interior decorator, took the Louis XIV style with him to Holland, where he made a thorough study of the textiles in the so-called "Indian" style, including the printed Indian calicoes imported by the Dutch East India Company. Through Jean Pillement and other artists, *chinoiseries* made their way into brocades and damasks. In 1685 the ship *Amphitrite* arrived in France with 8,000 Chinese silks, arousing the enthusiasm of Louis XIV and the Marquise de Maintenon. Madame de Pompadour, who was said to hold the greater part of the stock in the Compagnie des Indes and who greatly favored the importation of porcelains and silks from the East, is supposed not only to have contributed greatly to the diffusion of *chinoiseries* but also to have taken a personal part in the designing of these patterns in Lyons. Painted Chinese silks were often used as panels, but the *chinoiseries* are inventions of European artists, who peopled their stagelike representations of Chinese landscapes with Chinese figures (PL. 30). Jean Revel and Paul Androuet Ducerceau introduced naturalistic flowers into textile patterns as well as into other decoration, and about the middle of the 18th century these became characteristic stylistic elements in many branches of the applied arts and interior decoration. The previous geometric lozenge and wavy-line patterns were replaced by a naturalistic flow of lines. In addition to imitating lace, so-called "chenille" threads were used to give the effect of fur (said to have been done first in honor of Marie Leszczyńska, the Polish wife of Louis XV). A three-dimensional effect was sought in the flowers, fruit, butterflies, pheasants, and other animals, as well as in ribbons and bows, where previously the design had been flat. Philippe de Lasalle (1723–1803) was perhaps not incorrectly called the "painter of the loom" (PL. 26). Portraits, such as that of Catherine the Great of Russia, were woven after his designs, as were more or less historical paintings, such as the siege of Grigori Orlov, Catherine's commander in chief, and the sinking of the Turkish fleet at Çeşme. De Lasalle, who had been made a noble by Louis XVI, often used fluttering ribbons, bows, and cords with tassels in his textile patterns. Together with naturalistically painted flowers and fruits, he used birds such as the doves sacred to Venus, swans, and pheasants. In addition to his *chinoiseries* he occasionally designed figural compositions. These were not, as one would expect in the *galant* age, pastoral scenes, but portrayals of mendicant musicians and workers at the loom. Fabrics with small floral patterns (PL. 28) were also woven, primarily for men's waistcoats.

After the French Revolution the silk manufactories in Lyons were almost completely closed down. Of 14,000 looms operating there in 1787, only 3,000 remained active in 1789. As first consul, Napoleon had already taken account of the situation and had given commissions for the Tuileries to one of the chief contractors in Lyons, Perron, who had previously supplied silks for the Trianon and Fontainebleau. In 1811 Gabriel Dutillieu, of the Lyons Chamber of Commerce, informed the emperor Napoleon that half of all the looms had been shut down; 7,000 were still operable, but these also would have to be shut down if immediate possibilities for further development were not found. Napoleon personally saw to it that the higher officials of the state and court wore silk clothing. He ordered new wall paneling, curtains, and upholstery for many palaces (PL. 30). The patterns were now determined by such painters as Jacques Louis David and such architects as Charles Percier and Pierre Lafontaine. With the revived interest in the simple tectonic forms of the Greeks and the Romans, the acanthus, the laurel, the astragal wreath, and the garland returned to favor, as did the neoclassic ornament with trophies, orders, and decorations. The most successful designers were Dechazelle, Dougoure, and Jules François Bony.

The supremacy of French silk weaving was ensured by the brilliant invention of Joseph Marie Jacquard, the son of a poor weaving couple in Lyons. He constructed a completely mechanical loom which used cards punched with holes as a guide for the lifting and lowering of the warp threads (shedding). It could thus effortlessly be set for a multitude of weaves with different patterns, doing away with the drawboy and the color readers. Yet despite the progress toward technical perfection, weaving as an art did not experience a renaissance.

Germany and northern Europe. Ever since silk textiles similar to those that had been attributed to Regensburg were found in the tombs of the Spanish kings in Las Huelgas, some scholars have tended to consider all silks of this type as being of Spanish manufacture. They point out that as yet no written documentation has been found to testify that there were silk manufactories in Regensburg. A silk retable panel with the Crucifixion, St. Peter, and Bishop Heinrich II von Rotteneck (1277–96; the donor) was most probably made for the high altar of Regensburg Cathedral. It is a half-silk with a linen warp, and was therefore woven in an area where silk was not cheap. The weaving is technically so perfect that it was probably made by Italian weavers, but the design was certainly prepared by a German painter. This was not unusual, for close bonds existed between Regensburg and Venice, where, after the representatives of the city of Cologne, those of the city of Regensburg most frequently presided over the Fondaco dei Tedeschi. There was an Italian colony in Regensburg, to which the street name "Walchengasse" can apparently be traced. Bishop Wilhelm von Eichstätt is said to have summoned a weaver from Venice in 1482.

Half-silks with figural scenes seem to have been particularly popular in Regensburg. There were several: a Birth of Christ (destroyed), a Virgin surrounded by angels (Berlin, Staat. Mus.), a Virgin with St. Nicholas (Regensburg, Church of the Holy Cross), a fragment showing Alexander the Great's mythical ascension to heaven, and another with a falconer (Berlin, Staat. Mus.).

There are also indications that silk manufactories existed in Cologne, producing not only the famous Cologne borders but silks and half-silks as well. An example is the stately piece from Kloster Lüne (now in Hamburg, Mus. für Kunst und Gewerbe). The style of the drawing in this and similar fabrics is in accordance with the ornamental motifs of the Cologne goldsmiths, so a Cologne origin can hardly be questioned. A more popular type of woven woolen cloth was also produced there, examples of which are seen in paintings of the Cologne school. The patterns combined influences from Italian silks with German Gothic motifs.

In the region of the Lower Rhine and Westphalia silk weaving, and in Schleswig-Holstein, linen weaving (in Hamburg both) were revived during the baroque period. The mixed linen-and-wool fabrics of Schleswig-Holstein have an ancient tradition and, like the linen weaving of Perugia, can be counted among the noblest products of true folk art. The weaving of linen damask also flourished in Saxony and Schleswig-Holstein.

Frederick the Great introduced silk weaving into Berlin with great success, thus rendering the furnishing of his palaces independent of French silk imports. Empress Maria Theresa did much the same in Austria. In Holland and England silk weaving was advanced with the immigration of expatriate French weavers after the revocation of the Edict of Nantes. In Switzerland, where wool textiles of note were produced in the waning Middle Ages, silk textiles were produced during the baroque period, although they were limited to small forms such as ribbons and borders. In the northern and eastern European countries successful attempts to set up silk manufactories were made:

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

in Sweden, which had a strong indigenous folk tradition in weaving, in Poland, and in Russia. But none of these could seriously compete in the world market, which was dominated in modern times by the silks of Lyons.

Heinrich J. Schmidt

Contemporary European production. The differences in type, technique, and decorative method that had characterized the production of the various European countries through the 18th century and part of the 19th gradually diminished. Large-scale industrialization tended to replace craft production, while greatly expanded international commerce resulted in a diffusion of expressive forms. At times the traditional taste continued in industrial production, resulting, however, in stereotyped repetitions. The Industrial Revolution greatly increased production and the diffusion of products, extending to all social classes goods that had previously been the privilege of a few. The important customers and promoters of textile production were therefore no longer the courts or an elite middle class but all levels of society.

In the 20th century the Art Nouveau movement (pl. 33) in its varied European interpretations gave life to decorative forms characterized by elegant and colorful design motifs that were reflected in textile production for both clothing and furnishings. One result of the commercialization of textile production has been that the designer has become increasingly important; he is the creator of patterns suitable for large-scale industrial production as well as of exclusive models for more limited consumption (pl. 34). The perfection of mechanical means, of chemical industries for dyeing, and of the combination of varied materials in weaving characterizes present-day textile production. Besides the traditional plant and animal fibers, many other fibers of diverse composition are used, with the synthetics predominating.

During the 18th and 19th centuries the production of silk decreased in Italy, although a minimal textile activity continued in Lombardy and in the Bourbon factories of southern Italy. In the 20th century production greatly increased, particularly in Lombardy, and especially in Como. Much the same happened in Spain. France, however, generally maintained a continuous and fertile silk production, sustained by the fashion industry. In the 20th century factories and textile studios, formerly centered around Lyons, sprang up everywhere in France.

From the 19th century on the textile industry in the United States has become increasingly important, its activity being given great impetus by the invention of synthetic fibers.

In the production of cotton Great Britain has been of great importance in modern times, particularly after the new inventions of the 18th century and their perfecting. Switzerland has a thriving industry, the cotton products also involving the manufacture of eyelet embroideries. France long preserved its artisan tradition, turning to industrialization in the late 19th century. Italy had an important center of production from the 19th century on at Intra. Cotton textiles such as hemp and linen are produced today in most of the European and extra-European countries, as are woolens.

* *

China. Legend attributes Chinese sericulture and the invention of the loom to an empress of the 3d millennium B.C. Silk did not reach Japan until the 4th century of the Christian Era. In India, too, sericulture is thought to have been introduced by a Chinese princess.

Extant Chinese silks, however, date back only to the Han dynasty (206 B.C.–A.D. 220). The earliest Chinese silk textiles come from excavations in Central Asia (Paul Pelliot in Kansu; the Kozlov expedition in Urga; Aurel Stein in Noin-ula, Outer Mongolia; and A. von Le Coq in Khocho, Turfan) as well as from finds in Palmyra attributed to the period between 200 B.C. and A.D. 300. A silk rep with stylized landscape and bird motifs in Leningrad (The Hermitage) and a silk with dragonlike animals in cloud motifs, which, like others, came to light as mummy wrappings in the cemetery of a military colony in Lo-lang, are probably most representative of the textile art of the Han dynasty. The drawing corresponds to similar motifs on cinerary urns.

During the Han dynasty, and even more notably under the T'ang dynasty, when the Chinese had sent commercial emissaries as far as the Caspian Sea and the Indus, connections existed with India and with Sassanian, and later Islamic, culture in Iran.

Chinese T'ang-dynasty silks are preserved in the Shōsōin, the Treasury of the wife of Emperor Shōmu (701–56) in the Tōdaiji in Nara, Japan, and in the Hōryūji near Nara. A woven temple banner with four royal guardians on winged steeds arranged radially around a tree of life (Tokyo, Nat. Mus.) is often cited as an example of Sassanian influence, and it certainly has in common with Sassanian silks the hunting motif and the circular fields framed by pearl bands. The royal lion hunt is unquestionably an Iranian motif. Stylistically this piece, called Shitennō, after the four kings, is clearly Chinese. A silk, also in the Shōsōin, with an advancing rooster in a circle enclosed by vines is completely Chinese in style. The same can be said for the ram (Shōsōin) on another silk (pl. 31). By comparison a textile with confronted stags from Khocho (Berlin, Mus. für Völkerkunde) unquestionably points to influences from Islamic Iran. Particular note should be taken of a woven carpet with pointed oval motifs (also in the Shōsōin): it is the earliest textile known so far in which this oval scheme that was adopted in the Middle Ages in Arabian and European textile art appears.

No silk textiles seem to have survived in China from the late T'ang to the late Sung dynasty (960–1279), but outside China itself a great number of silks have survived from the Mongol period, an era characterized by political upheavals. Many of these are preserved in European churches, where they were used in ecclesiastical vestments. The Mongols, a nomadic people of Central Asia, were united into a mighty race in the early years of the 13th century by Genghis Khan and in 1215 were called in by the Sung-dynasty lords and gradually conquered China. They went on to conquer Turkistan (ca. 1220) and other countries of western Asia, and in 1236 they invaded and conquered Russia. In 1258 Hūlāgū Khan conquered Baghdad, Iraq, and Iran, bringing to an end the Arabian Abbasside dynasty and setting up Mongolian rulers (in Baghdad, Tabriz, and other cities) whose dominion lasted until the end of the 14th century. In Syria the Mamelukes stopped the conquering Mongol hordes. A second Mongol kingdom was founded by Tamerlane (Tīmūr Lenk; 1336–1405), a descendant of Genghis Khan, in Samarkand, from where he subjugated all the Near East, with the exception of Syria and Egypt, and got a foothold in the western part of India, where, with the Moghul dynasty, the dominion of the Mongols, who had been converted to Islam, continued to the middle of the 19th century.

In 1271 Marco Polo (1254–1324) traveled with his father Nicolo and his uncle Matteo to Peking, then the residence of the Mongol emperor Kublai Khan. He remained in eastern Asia for two decades and visited many of its territories. In 1292 he returned, following a route through Persia, Iran, Iraq, Armenia, and the Black Sea to his native land. He was not, however, the first European to visit Peking; in 1258 Wilhelm van Roebrook, as he himself stated, met the goldsmith Guillaume Boucher, who had formerly had a workshop on the Grand Pont in Paris, in Peking where he was serving as goldsmith to Kublai Khan.

Following this general survey it can be stated with some certainty that the gold brocade patterned with small lotus flowers used for the dalmatic found in Perugia among the funeral vestments of Pope Benedict XI (d. 1304) is the first of the Chinese silks to reach Europe that can be precisely dated (pl. 15). This was followed by the Chinese silk brocades found in the tomb of Cangrande I della Scala (d. 1329) in Verona (pl. 16). A year prior to his death Pope Benedict XI had negotiated with the Tartar khan Gazan for a crusade against the Turks. In the 1295 inventory of the Vatican Treasury there is an entry for "panni tartarici" (Tartar fabrics). Abū'l-Fidā, a Syrian prince, stated that in 1323 he was eyewitness to the

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

delivery of 700 silk textiles, on some of which the name of the Sultan was woven, to the Mameluke sultan Mohammed al-Nāṣir, the son of Ibn-Kala'un, on behalf of a Mongolian khan. In the Church of St. Mary, Gdańsk, there exists a black-and-gold brocade with Chinese dragons in the corners and pairs of parrotlike birds in medallions with the name of Mohammed al-Nāṣir in the wing joints.

Chinese silk brocades from the Mongol period are to be found in many Western church treasuries (Bern, Brandenburg, Brunswick, Danzig, Perugia, Regensburg, Stralsund). They can be superficially identified by the fact that the gold thread in the Chinese brocades consists of flat gilded leather strips, while in the Near East and Europe gold thread consisted of gold leaf beaten on a gut or silk core.

Some of these brocades with a Naskhi inscription in praise of the sultan are especially noteworthy: the gold brocade comprising a cope and dalmatic (Regensburg, Cath. Treas.) on which appear dragons and winged lions in a particularly Chinese style bears the incontestable signature of the Arabian maker — 'Abd al-Āzīz; the gold brocade in Brunswick has inscribed ornamental borders similar to the decoration of the liwan of the tomb of Tamerlane's sister (Chujuk Bika) in Samarkand.

During the period of Mongol domination in Persia and Turkistan artistic currents flowed in both directions. It is sufficient to recall the miniature brush paintings, apparently western Turkish in origin, which some scholars consider imitations of Chinese painting and others the results of a fruitful synthesis of Chinese and Persian art. The gold brocade of a cope from the Church of St. Nicholas in Stralsund (Copenhagen, Kunstindustriemus.) has winged lions and dragons in a free allover pattern characterized by plunging diagonals. Its large leaves are close in style to those on Persian fabrics, but the animals are distinctly Chinese.

Chinese damask weaving was outstanding. The dalmatic of the German coronation robes in Vienna (Schatzkammer der Wiener Hofburg) is a Chinese damask with bands of waves and ornamental cloud motifs. In addition to the free disposition of the pattern on the surface, the silks often had the so-called "pointed oval" design, formed when two vertical wavy bands or sinuous lines are shifted in relation to each other by half a length. The "pointed oval" has already been encountered as a medallionlike motif on a carpet in the Shōsōin in Nara. Thus, just as the Regensburg Chinese brocade carried the clearly legible signature of an Arabian artist (see above), this Persian textile has Chinese characters, although not incontestably identifiable, next to a clearly legible Arabian inscription. During the Mongolian period Chinese fabulous animals such as the *fêng-huang*, the *ch'i-lin*, and the *lung-ma* were used in textile patterns throughout the Islamic East. Chinese damasks, which doubtless contributed to the flourishing of the local damask weaving and the spread of the free allover pattern, have been found in Egyptian graves of the Mameluke period.

The Mongol hold in China was weakened during the Ming dynasty (1368–1644), which attempted to isolate China and to introduce the rebuilding of the Great Wall, a most implausible plan; but meanwhile, when after the sack of Constantinople the Turks sought to impede Venetian and Genoese trade with eastern Asia, the seaways to the Far East were opened by the Europeans. In 1516 the Portuguese landed in Macao, and even before the founding of the East India Company (ca. 1600) in England and Holland, Dutch merchant ships were traveling to the Far East. The Jesuit Mission begun in 1580 led to the study of Chinese language, calligraphy, and art in Europe. After the last of the Ming emperors committed suicide, the Manchu Tartars were set on the Chinese throne (1644–1912). The second emperor of the Manchu dynasty, K'ang-hsi (Shêng-tsu), was an eager and successful promoter of Chinese culture.

In 1683, Louis XIV, who had also founded an East Indian trading company, sent five Jesuits to China as royal mathematicians. At that time the first collections of Chinese porcelains began to be formed in European courts; these inspired imitations of the porcelain and adaptations of the motifs in interior decoration and textiles.

Although not much trustworthy information is available on Chinese silks of the Ming period, some studies seem to permit certain conclusions to be drawn. In 1743 T'ang Yin, the director of the Ching-tê-chên factory, believed it possible to establish that most of the Ming porcelain patterns were taken from embroidery and brocaded satins. Also in the 18th century, studies were made that seem to indicate that at the time of Emperor Chia-ching (1522–66) porcelain decoration was painted on blue, yellow, and brown-gold grounds in the manner of silk brocades, and the following motifs, similar to those on the silk brocades, were introduced: intertwined dragons, clouds, phoenixes, *ch'i-lin*, lions, mandarins, ducks, gold coins, dragons in medallions, pairs of phoenixes, peacocks, sacred storks, the *ling-chih* (mushroom of immortality), the great lion on a couch, wild geese (in clouds and with their twin nests), crested waves, the hundred flowers, phoenixes in clouds and flying through flowers, the Taoist Eight Immortals, dragons munching pearls, lions playing with embroidered balls, water lilies, and flying fish. An extant silk brocade (Berlin, Staat. Mus.) seems to indicate that this list of motifs, exaggerated as it may seem, has a basis in fact. In the same museum gold brocade with intertwined dragons in four-lobed medallions on a red flowered ground and a frieze of decorative Kufic script seems to be a Turkish or Islamic copy of such a silk brocade. Some European and American museums have silks, velvets, and damasks with lotus- or peony-blossom designs which are probably examples of the production of the Ming period.

Under the Manchus textiles became more sumptuous. In addition to pile carpets, tapestries (PL. 32) and embroideries were particularly popular. Velvets in which the drawing and light-catching qualities were enriched by the use of cut and uncut pile were greatly favored. Many of the Russian flags captured (ca. 1700) by Carl XII, King of Sweden, were of Chinese silk. A Chinese silk on which is embroidered the date 1697 is preserved in the church at Åsbo in Östergötland. The pattern consists of circles with *fêng-huang*s, cranes, and attributes of the Eight Immortals. The emperors K'ang-hsi (1662–1722), Yung-chêng (1723–35), and Ch'ien-lung (1736–95) established court silk manufactories much like the Gobelin manufactories of 18th-century Europe; some of these worked only for the court and some only for the export trade. In the Nelson Gallery of Art and the Atkins Museum in Kansas City are 70 silk garments once belonging to the imperial prince Kuo Ch'in Wang (d. 1738). Other Manchu textiles have also found their way into many museums throughout the world, but like those of the Ming period, they have been little studied.

Japan. The oldest written records of Japan date from the 6th century of our era. It was then that the Chinese introduced Buddhism to Japan; and with it art, particularly sculpture and painting, flowered. As in China, picture embroidery and tapestry work seem to have preceded painting. Perhaps conclusions about the contemporaneous textile patterns in Japan can be drawn from the representations of silk textiles that appear in later paintings and sculpture; for instance, four-lobed medallions and small lozenges with diagonals form an over-all pattern on the garment of Kichijōten, goddess of good fortune, in a hanging scroll of the Nara period (ca. 775, Yakushiji). From the 9th to the 12th century leaves and flowers in a scattered pattern were often used on the garments of statues and painted figures such as the small Shinto images from the end of the 9th century (Yakushiji). The garment of the Bodhisattva Jizō in a silk painting of the 13th century (Berlin, Staat. Mus.) consists of a magnificent brocade with large flower rosettes set in lozenge-shaped fields. The random pattern of small flowers also continued to be used, as is shown in the silk of the Daitokokuji, a work of the 14th century (Kyoto).

Many Japanese silks have been preserved in the costumes of the No theater (IV, PL. 9), which was active from the 15th century on. They were generally painted or embroidered, but some were of simple silk brocade. Particularly lovely examples of the latter are a violet-gold brocade (16th cent.) with large *kiri* blossoms made of gold paper strips (Berlin, Staat. Mus.) and a gold brocade with an allover pattern of aquatic plants and leaves (17th cent.; Met. Mus.). The Japanese textiles are dis-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

tinguished by naturalistic drawing and, as far as possible in textile patterns, by asymmetrical composition. A glowing red velvet of the Edo period (1615–1867; Paris, Mus. des Arts Décoratifs) is a characteristic example.

In 1542 the Portuguese reached Japan; the Jesuits arrived in the same year. Although the Portuguese and Spaniards brought only a few art and crafts objects from Japan to Europe, the Dutch, despite Japanese attempts in the second half of the 17th century to shut themselves off from the rest of the world, were more successful in continuing trade relations.

India. Although there are countless written reports of Indian textiles (raw materials in ancient times were usually linen and cotton), neither archaeological finds nor wall paintings offer enough evidence to permit any true analysis. Striped fabrics worn by a dancer and by palace ladies in 7th-century frescoes in Cave I in Ajanta (VII, PL. 457) seem to resemble a striped cover found in Nira, which is, however, executed in the tapestry technique. But this hardly suffices to form a bridge to Indian textiles, not even to the striped ones of later centuries, which are much finer and lighter, in infinite variations, with and without borders. Up to modern times simple patterns fitted to the weaving technique, such as squares, lozenges, and zigzag bands, were preferred in cotton and silk saris and shawls. Painted fabrics, cotton dyed in a method similar to the batik technique, printed cotton, and chintz were very popular. Tīmūr, who led the second conquering wave of Mongols, is said to have transferred silk weavers from India (Delhi) and Syria to Samarkand. In the 18th century the world market is said to have been flooded with Indian silks, most of them from Cambaya, the chief port of the province of Gujarat. Most probably almost all Indian stuffs found throughout Europe since the 17th century were actually Indian in origin, even though there is good reason to suppose that many such fabrics were copied in Venice and some probably in Spain. The ban on imports of Indian silks by some European countries, England among them, is indicative of the extent of the Indian silk trade. As a member of a legation sent by Duke Frederick III of Schleswig-Holstein to Shah Ṣafi of Persia in 1637, Adam Olearius established that some of the Indian silks were superior to the Persian ones. Johann Albrecht von Mandelsloh, one of Frederick III's pages, independently traveled from Isfahan to India, where he saw the silk manufactories in Amadabad and listed the textiles prepared there. J. Savary de Brûlons, inspector general for Paris customs in the 18th century, in his dictionary of the silk trade defined *furie* as painted silks which came from China or India to be copied in Europe; their patterns were so confused that it was supposed they had been designed by a fury. The close similarity of individual motifs to those of the unquestionably Indian calico prints is the best proof that these heavy silk brocades, with brocading threads of almost pure silver, were actually the products of Indian manufactories.

The weaving centers of Burma, Cambodia, and Siam also deserve attention. In Burma the favorite patterns were stripes, both straight and wavy. In Cambodia and Siam, the textiles were often woven in predetermined sizes with field and borders, similar to a carpet in form. Striped patterns, some with animals (lions, buffalo, elephants, and horses) in rows, were made in both cotton and silk. The Shan, in the east of Burma, were particularly active in silk weaving. Heavy gold brocades were woven in Siam, light ones in Cambodia. Many decorative forms in the applied arts of these countries, especially lacquer and niello work, seem to be derived from textiles. In Indonesia (Java) silk weaving was introduced from southern India. But the art of batik, which also came from India, underwent a greater development. It is attested to since 1275.

Iran. Like carpet weaving, silk weaving reached a high point of perfection in Iran. The textile arts, probably in the form of tapestry weaving, were particularly important in ancient Iran, as indicated by the architectural sculpture in Persepolis and Susa. The earliest evidence of Iranian silk weaving is from the Sassanian period (226–637). This dynasty was aware of Iran's key position between East and West and made a place for itself in the silk trade, raising silk weaving to such a high level that a Chinese traveler, Hsüan-tsang, who sojourned in Afghanistan at the beginning of the 7th century, greatly praised the art of the Persian weaver.

The garments of the Sassanian kings and their courtiers represented in the rock reliefs of Tāq-i-Bustān serve to identify surviving silks, especially the silk with the Sassanian dragon — the senmurv (Vict. and Alb.). Some of these silks, which probably reached European church treasuries in the early Middle Ages as reliquary wrappings, represent Sassanian kings hunting next to the tree of life; two are in Berlin (Staat. Mus.), one of which came from the Trier Cathedral Treasury and the other from St. Ursula in Cologne. A third, from St. Kunibert in Cologne, is now in the Diözesan-Museum there. The Sassanian kings Shāpur II (310–79) and Kavādh I (488–96) brought Syrian weavers, who were considered particularly skilled, to Persia. This would explain the occurrence of silks with representations of Persian kings and plant ornament of a late-antique type, as in the handsome piece of this kind from St. Kunibert in Cologne. Fragments of this cloth are in S. Ambrogio, Milan, and in Prague (Cath. Treas.). Sassanian silks such as those with senmurvs, hunting scenes, roosters, guinea hens (PLS. 5, 7), and ducks in roundels greatly influenced Byzantine, Chinese, Arabian, and even Spanish designs.

After the Arabian conquest of Iran a change in style gradually took place. The manufactories in ancient Iranian territories such as Tustar in Khuzistan probably held fast to the old Sassanian forms for a long time, but eventually the feeling for organic form was replaced by a tendency toward abstract stylization. The Arabian script adopted by all the peoples subjugated to Islam — who usually, however, retained their own languages — played an important part in the decoration of architecture and the applied arts. A silk from St-Josse-sur-mer, near Calais (now, Louvre), with a Kufic inscription datable to the 10th century, invites comparison with the silk with elephants from the tomb of Charlemagne (Aachen) in order to pinpoint the change in style. Even Byzantine art, rigidly frozen in comparison to Greek art, still revealed something of organic life; but the early Islamic images stiffened into signs and hieroglyphs. In addition to the ancient Iranian weaving manufactories in Khuzistan there were also some in Baghdad, where the Buyids, descendants of the Sassanians and stewards of the Abbasside caliphs, determined trade and traffic and also set up the textile manufactories called *ṭirāz*. These workshops also wove the so-called *khil'at*, a garment which was presented by the ruler or other dignitary to particularly trustworthy followers as a sign of distinction. On the whole only the inscriptions worked in silk have remained intact, but these often name the ruler and the place and date of manufacture and are therefore important documents for the study of textiles.

As in Byzantium, textiles with eagles also existed here, but the griffin motif was much more common. The inheritance of the ancient East and of Greek antiquity was revived in designs showing fabulous beasts such as griffins, winged lions, sphinxes, and harpies. The silks from graves in Rayy (PL. 9) are particularly interesting, but unfortunately the excavations were not carried out systematically, thus precluding any certain dating. Rayy was destroyed by the Mongols in the 13th century, so the textiles must have been executed prior to that date. The artistic double weaves with a different pattern on each side testify to the high technical and artistic perfection achieved. There were also satin twills and damasks.

During the Mongol rule Chinese fabulous beasts such as the phoenix and the *ch'i-lin* appeared in 14th- and 15th-century Iranian textile patterns, but they were so thoroughly assimilated that the Iranian character of the work remained dominant. Examples are the garments of Cangrande I della Scala in Verona, the burial garment of Duke Rudolph IV of Hapsburg (1358–65) in Vienna, and many other brocades which were later transformed into church vestments. A comparison of the noble silver brocade with depiction of the *ch'i-lin* in lozenges (Berlin, Staat. Mus.) and another with *fêng-huang*s (Vict. and Alb.) with Persian miniatures leaves no doubt as to their Iranian provenance.

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

In the beginning of the 16th century a native dynasty, the Safavid (1502–1736), again came to the Iranian throne. First in the residence at Tabriz, then in Qazvin, and finally under Shāh 'Abbās I (1578–1628) in Isfahan, Persian art, including pile carpets and silk weaving, reached its zenith. Like the Persian carpets, costly silk and velvet brocades were in great demand in the European courts. In 1600 Fetty Beg presented in the name of Shāh 'Abbās a velvet brocade with a representation of the Virgin and Child (Venice, Mus. Correr) to the Doge of Venice, Marino Grimani (1595–1605).

Mention has already been made of the trip Adam Olearius, who translated the *Gulistān* (Rose Garden) of the poet Sa'dī (d. 1291) into German, made to Persia with an embassy sent by Duke Frederick III of Schleswig-Holstein. In addition to Persian ceramics and other magnificent objects, he brought back costly velvet brocades, which in 1817 were taken to Rosenborg Castle in Denmark, where they were used as wall hangings. Louis XIV also bought Persian velvet brocades. The French traveler J. Chardin stated that he had seen silk manufactories in Yezd, Kashan, and Isfahan. They also existed in Resht, Tabriz, and Meshed.

Some silk and velvet textiles have artists' signatures (Mu'izz ud-Dīn, 'Abd-Allāh, Agā Maḥmād, Shāfī 'Abbāsī, son of the important miniature painter Rizā-i-'Abbāsī). As in miniature painting, old Iranian legends were represented in textiles: Alexander's battle with the dragon, Laylā and Majnūn, Rustam's battle with the lion. There was also a kind of genre scene representing falconers, fishermen, cupbearers, hermits, and others. That these velvets with figural scenes were also used for garments is shown in a portrait of Robert Shirley by Anton van Dyck (Midhurst, Sussex, Petworth Coll.). Silks were also woven for use as tomb covers (such as those for the shrine of Shah Süleyman in Meshed with the date 1669), as prayer carpets (such as those for the shrine of Sheik Safī in Ardebil; XIII, PL. 423), and as carpets and banners.

In the 18th century the patterns became simpler, consisting generally of flowers arranged in rows or set in lozenges.

Egypt, Syria, and Asia Minor. The oldest datable Arabian linen textile is the turban of a certain Samuel ibn-Musa, probably a Jew, with an inscription worked in wool and an ornamental band (8th cent.; Cairo, Arabic Mus.). Another early piece is a linen textile (Vict. and Alb.) with a Kufic inscription and the name of the Ja'far-billah, who is said to have lived at the time of Caliph Narwān II (744–50). Its clearly Kufic *ductus* makes it an important incunabulum of Arabian script. Under the Abbassides in Baghdad and the Fatimids in Cairo linen weaving with embroidered or tapestry-worked silk inscriptions flourished, and all forms of Arabian epigraphy — simple, cuneiform, uncial, and Kufic — flowered. Many of the *ṭirāz* workshops existed in Shata, Tinnis, and elsewhere in Egypt, and in Iraq and Iran (Baghdad, Merv, Nishapur). Ernst Kühnel and L. Bollinger (1952) have compiled a corpus of the *ṭirāz* textiles with inscriptions, and, together with Etienne Combe and Gaston Wiet (1930), initiated the study of Arabian paleography. The Prophet Mohammed disapproved of silk as being a luxury, but notwithstanding, silk weaving flourished in all Islamic countries.

Some Egyptian silk textiles were directly related to Coptic textiles; others, such as those with falcons, seem to continue the ancient Egyptian tradition of motifs. Influences from the *opus sectile* or *opus alexandrinum* can be established in the patterns of a third group.

The Egyptian workshops seem to have continued operating under the Mamelukes. Sultan Ḥasan is said to have distributed many robes of honor from workshops in Alexandria, Cairo, and Damascus. Of the silks, some with peacocks in lozenges are noteworthy because of their similarity to patterns on ceramics found in Fostat. Stripes, with or without inscriptions and animal and plant ornamentation, were especially popular (PL. 9), and almost all of them bore inscriptions in the Naskhi script, generally eulogies to the reigning Mameluke sultan. These silks with inscriptions were exported to Italy, where many Italian painters and sculptors used them as models in their paintings (cf. PL. 360; II, PLS. 250, 257; VI, PLS. 85, 87).

The Mameluke weavers were particularly noted for their superb damasks, whose patterns were created not by differences in color but by the light-catching quality of the varying weaves. Egyptian graves in Drunka, near Assiut, have yielded damasks with inscriptions referring to the Mameluke sultan Muḥammad al-Nāṣir as well as Chinese fabrics with a freely designed chrysanthemum pattern, which certainly influenced Egyptian textiles. The Chinese fabulous beasts, although less popular in Egypt and in Syria, where the Mongol hordes were turned back, were gradually adopted in textiles. On the whole, however, characteristically Egyptian animal ornament (griffins, cheetahs, rabbits, fish, peacocks, hawks) dominated.

A gold brocade in a damasklike weave was used by the Florentine Master of the Bambino Vispo as a model for the dress material of the Madonna in Würzburg (Martin von Wagner Mus.). Although no ruler is named in the inscription, the reference to "al-Ashraf" (the glorious) led to the conclusion that it was woven under the Mameluke sultan Qāit Bey, who reigned in the second half of the 15th century; but it was later learned that the Master of the Bambino Vispo worked in the first half of the 15th century. Thus this painting, like many others, is a good example of the importance of painting in the dating of textiles. Jacopo Bellini was also influenced by Mameluke damasks, both as models in his paintings (II, PL. 250) and in the textile patterns he designed for Italian weavers.

The damasks of the Mameluke period are usually made in the following weaves: warp satin for the drawing and weft satin for the ground, or vice versa; warp twill and weft twill; warp satin or warp twill for the drawing and taffeta weave for the ground.

The Arabian geographer Idrisi (1098–1164), who lived for a long time at the court of Roger II in Sicily and then in Moorish Spain, made note of the manufactories in Syria producing damask, which took its name from the city of Damascus. Yet the history of Syrian silk weaving properly begins in late antiquity. The late-antique silk with a Persian hunting scene (Cologne, Diözesan-Mus.; Milan, S. Ambrogio) was copied after the Arabian conquest, with an Arabian inscription in Kufic script. Syria was then temporarily reincorporated into the Byzantine kingdom under the emperor Nicephoros II Phocas (963–69). In the meantime the Syrian silk weavers seem to have adopted the Arabian decorative style, which came from the caliphate of Samarra, near Baghdad. There is much evidence that the so-called "pseudo-damasks" with their etchinglike designs acquired their unique form under the influence of an early Islamic decorative style in Samarra. From the reign of the German emperor Otto I to that of Henry II many of these fabrics were made into ecclesiastical vestments for German cathedrals (Mainz, Bamberg, Xanten, Brauweiler, and Merseburg). Otto II married Theophano, a Byzantine princess; her son, Otto III, patronized Byzantine art, and Arabian silks were rarely preferred to the Byzantine ones. Yet the patterns were created under the influence of early Islamic art. Sigrid Müller-Christensen (1960), in her thorough study of the textiles from the tomb of Pope Clement II in the Cathedral of Bamberg, has treated these "pseudo-damasks" at length and considers them to be Islamic textiles. The peacock decoration of the silk fragments, which reached the West as reliquary wrappings and were sometimes later (as in Canterbury) used as the backs of seals, is in accord with the early Islamic ornament on the desert palace of Mshattā. Other motifs, such as the double-headed eagle from the Monastery of St. Peter in Salzburg (Zurich, Abegg Coll.), which differs greatly from the Byzantine eagle, and the damasks with lions and birds next to tree-of-life motifs in roundels in Brauweiler, Siegburg, and London are pure examples of the Seljuk animal style, so that they could have been made either in Seljuk Syria or in Asia Minor. It must be remembered that Konya and Syria were conquered by the Turks in the 11th century and Bursa in the early decades of the 14th century. The Mamelukes were then already in power in Syria, but the Seljuk traditions remained active there as well, as is particularly noticeable in the script, of which there are many examples on the mosque lamps, unquestionably made in Syria, as well as in architectural inscrip-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

tions. A group of gold brocades with stripe patterns and inscriptions are so similar to the Naskhi script on Syrian glass and the so-called "Nurinaskhi" of the architectural inscriptions on the citadel in Aleppo that these brocades, from which were made countless chasubles in the Church of St. Mary of Gdańsk, very probably were the products of Syrian looms.

Marco Polo praised the pile carpets of the Seljuks who had settled in Asia Minor. He stated that Greek, Armenian, and Turkish craftsmen worked side by side in the cities. Besides the Anatolian pile carpets sought after throughout the world, silk textiles, and in particular crimson ones (according to Marco Polo), were also made there. In the Musée Historique des Tissus, Lyons, is a silk with lions heraldically arranged in circles and with a Naskhi inscription referring to the Seljuk sultan Kaykūbad (1219–37), who was called the lion and whose heraldic emblem was the lion. Heraldic emblems were particularly developed by the Seljuks and, via the Crusaders, influenced European heraldry. A silk with heraldic eagles on shields is so close in style to a corresponding motif in the architectural decoration of Konya (anc. Iconium), the capital of the Seljuk kingdom of Rum (Rām), as to justify attributing it to a manufactory of that area.

The Turkish sultans encouraged silk weaving and particularly stressed a national production (the lists of weavers preserved in Bursa are said to contain only Turkish names), with the most important workshops in Bursa and Üsküdar. Motifs taken from Chinese and Persian silks (cloud bands, lotus blossoms) received an undeniably Turkish imprint. Arabesques and moon crescents, geometric stars, and naturalistically drawn flowers such as tulips, carnations, hyacinths, and lilacs formed harmonious patterns together with rosettes and star motifs.

Lozenges, pointed ovals, and vertical wavy lines play a large part in Turkish patterns. The colors are usually intense and glowing. Augier Ghislain de Busbecq, German ambassador to the court of Süleyman the Magnificent (1520–66), was most impressed by the scarlet, hyacinth yellow, and blue. The magnificent robes of the sultans Beyzazıt II (1481–1512) and Süleyman can be seen in the Topkapı Saray Museum, Istanbul.

In contemporaneous European brocades there was a high percentage of copper in the gilded silver threads, but in the Turkish, Persian, and Indian brocades the threads were of pure silver. Since some Turkish brocades were faithfully copied in Venice, this difference in material is of importance in distinguishing them.

The Turks at that time also produced outstanding velvet brocades in Bursa and Üsküdar. According to the Turkish historian Mehmet Nesri, the velvet brocade called *kamhâ* is mentioned in a document as early as 1348. In a list given to the Venetian ambassador in 1483 three types of velvet from Bursa were mentioned: *kamhâ*; "Üsküdar covers," woven to measure and particularly sought after in Europe; and velvets with the pomegranate design. In general the Turkish velvets, which are usually more colorful than the Italian, emphasize naturalistically drawn flower patterns (PL. 14). Bright reds, blues, and greens dominated, and strong contrasts, such as red ground and green pile or blue ground and red pile, were the rule.

Arabian script was much used on sarcophagus covers, wall panels, and banners, as witnessed by the so-called "blood banners" and other booty banners from the Turkish wars in the Vienna museums. Arabesques were also used in new and interesting ways in covers and wall panels. Many of the Islamic influences in European baroque art came from Turkey.

EMBROIDERY. Embroidery followed a parallel course to textiles in all their stylistic changes and was closely bound to them. The embroidery tool is a needle. In ancient times needles were made of bone, fish bone, or bronze; in modern times they are usually made of steel; with the aid of the needle threads are incorporated in decorative forms or figural compositions on a foundation consisting of fabric, leather, or paper. The embroidery generally takes its name either from the foundation material or from the type of thread used (for example, linen, wool, silk, silver embroidery; wool embroidery on linen, silk embroidery on wool). Gauze, tulle, canvas, and filet embroidery are so called according to specific kinds of foundation weave. Embroideries are indicated as flat, relief, and application (appliqué) embroidery according to specific technical procedures.

There are many types of embroidery that in themselves can produce a multiplicity of shapes. Thread, of course, is a fine medium for drawing; it is capable of constructing more or less unbroken contours or of filling in surfaces. Variation in the spacing of the stem stitch results in many different kinds of line: the thread can be knotted into a chain, plait, or braid stitch; thread sections of equal length can intersect each other at right angles to form a cross-stitch; small cross-stitches made in the direction of the foundation warp and weft result in a linear stitch called the Holbein stitch (because Holbein represented it realistically in his paintings). The "Gobelin stitch" resembles the linear technique of tapestry weaving, as does the satin stitch, with which surfaces can be covered by parallel juxtaposed layers. At the time when Jan van Eyck was developing the use of overlapping (superimposed) glazes in painting (Lasur technique) the so-called "Burgundian" embroidery (or Lasur embroidery), a kind of couching, was developed. At the threshold of the baroque, tambour work was popular. This was done with a special hooked needle, like a crochet hook, in a kind of chain stitch on a tightly stretched foundation cloth. The needle was inserted in the cloth and pulled through the loop of the previous stitch on the underside. Filet embroidery (reticella) required a specially crocheted foundation made with the filet needle. The netlike open meshes were filled in with white linen thread to form the design. Filet embroidery may be said to have formed a sort of bridge to lacework, which, however, is executed in a different technique.

The earliest embroideries known so far are Egyptian, but this undoubtedly is because of favorable climatic conditions for preservation rather than any real preference for embroidered fabrics. It is, in fact, known that the Egyptians considered both embroidery and polychrome textiles foreign to their taste and much more fitting to the barbarian peoples and to specific divinities such as the cat goddess, Bast. This did not in the least diminish their skill in embroidery, repeatedly evidenced both by literary sources and by surviving monuments and figural representations. Herodotus (III, 47) describes the girdle given by Amasis to the natives of Messina as being of linen with woven decorative motifs and embroidered in gold and cotton threads. Appliqué decoration was also known in Egypt, particularly of leather and beads. Embroidery was of great importance among the other peoples of the eastern Mediterranean area, as is known from the Biblical descriptions of the precious embroideries which decorated the Tabernacle of the Hebrews as well as the garments of the high priest (Exodus, 39: 3). Embroidery was equally widespread among the Babylonians and Assyrians, as shown by the figural representations of clothing in extant monuments. Babylon's great renown in this field was noted much later by Pliny, who recalls that stuffs of this type were called "Babylonian" (*Historia naturalis*, VIII, 74).

The introduction of embroidery into the Western world, through Greece, goes back, on close analysis, to a more or less direct Eastern origin. It is not by chance, for example, that important representations of cloth with embroidered ornament are found represented in archaic works of art (as the clothing of some of the korai of the Acropolis); Eastern influences going back even earlier can logically be supposed to be responsible for much of the decoration of the Cretan female attire, known from contemporaneous figural representations (although it is not entirely clear from Greek vase paintings whether the subject treated is embroidery or tapestry). The so-called "loom of Penelope" seen on Greek vases is, however, undoubtedly a tapestry frame.

In Coptic art, so rich in textiles and tapestries, embroideries are rare and relatively monotonous, being mainly of satin stitch (PL. 4). By contrast the early Islamic period was very productive; inscriptions on the robes of honor (see above) bestowed on dignitaries were embroidered in wool or silk, and much linen embroidery existed in many techniques. The coronation robes of the German emperors and the imperial alb (Vienna, Kunst-

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

hist. Mus., Schatzkammer) of the 12th century are marvels of embroidery produced by the royal workshop in Palermo.

The art of embroidery flourished in Byzantium. Mosaics in Ravenna (such as that in S. Vitale) showing the Empress Theodora with her court depict richly embroidered garments. Also in Ravenna (Mus. Naz.) is an embroidered altar hanging of the 9th century from S. Apollinare in Classe with SS. Fermo and Rustico. A richly embroidered pallium with the consecration of the bread and wine in the Collegiata of Castell'Arquato (PL. 12) was, according to the Greek inscription, donated by the Patriarch of Aquileia, Ottobono Robario dei Feliciani, in 1315 and was later altered to make an ecclesiastical vestment worn in the orthodox Mass. The embroidery seems to have been executed in Byzantium in the 11th century but may possibly be of the early 14th century.

One of the earliest European embroideries known is a maniple from the tomb of St. Cuthbert, in Durham. According to the inscription it was made to the order of Bishop Fridestan of Winchester (d. 931). It is a finished needlework painting, stylistically comparable to contemporaneous miniature painting. The English women were — as testified in many sources, such as the *Gesta Guilhelmo Ducis Normannorum et Regis Anglicorum* — particularly skilled in needlework and gold embroidery; opus Anglicum was highly prized in the Middle Ages. Names of some of the embroideresses have come down to us: an Alwid of Ashley in the county of Buckingham; one Levier, of whom it is written in the Domesday Book that she worked for the king and queen of England; the wife of a certain Aldered in Winchester who embroidered for Queen Mathilde, wife of William the Conqueror; and noblewomen such as Duchess Aedelfleda, who embroidered a hanging for Ely Cathedral. It is said that Queen Alfled and her daughters worked with the needle. Queen Mathilde may well have participated in the embroidery of the Bayeux tapestry, which represents the Norman conquest of England. This is in any case a northwest-European work, embroidered in wool on linen, stylistically determined by indigenous folk-art influences.

In most European countries, and particularly Italy, embroidery, like all fine arts, was generally influenced by Byzantine art. The above-mentioned pallium in the Collegiata of Castell'Arquato and the so-called "dalmatic of Charlemagne" (ca. 1400; St. Peter's, Rome), whose figural style is close to the Byzantine mosaics, may be the products of Byzantine workshops in Italy. The Hungarian coronation robe, dated 1031, originally a bell chasuble and donated by St. Stephen of Hungary and his queen Gisela to the church in Székesfehérvár, seems to be a German work with Byzantine influences.

The Byzantine riding cloak of King Henry II in the Cathedral of Bamberg is a Byzantine work. South German 11th-century embroideries are the star cloak presented to Henry II by Duke Ismael of Apulia, worked with the starry heavens, and the robe of St. Kunigunde, made from a cope, with the story of Christ's incarnation, close in style to the Regensburg scriptoria (both, priv. coll.). The gold embroidery was executed in couching with varicolored silk threads partially connected with one another as in woven textile patterns. Occasionally woven textiles with the so-called "rota" pattern (circles) were used as foundations for the embroidery, as in the choir robe of Pope Boniface VIII (before 1295; Anagni, Cath. Treas.), decorated with roundels containing eagles, falcons, and heraldic birds.

In the 13th century the taste for gold embroidery seems to have spread throughout all Europe. Examples include a dalmatic in the Halberstadt Cathedral embroidered in gold with centaurs, stags, and vines; the pontifical shoes and stockings of the archbishops Gautier Cornut (d. ca. 1240), Pierre de Charny (d. 1274), and Gilon Cornut II (d. 1292) in the Cathedral of Sens; the ecclesiastical robes of Thomas à Becket (d. 1170); and a maniple of St. Edmund of Canterbury. Opus Anglicum was prized to such an extent that in the 15th century Thomas Palaeologus (despot of Morea) presented Pope Pius II with a cope embroidered in this technique (PL. 13).

Picture embroidery on linen had also already reached a high point of perfection in the 13th century, as shown by some chasubles from the Abbey of St. Blasien in the Black Forest (now in Carinthia, St. Paul im Lavanttal).

The Gothic white-on-white embroidery is an effective example of the artistic possibilities inherent in embroidery; in it the design is formed mainly by various types of stitches in a finely articulated linen technique (PL. 13). A white linen embroidery on a colored linen foundation with the legend of St. Catherine and the twelve Apostles (ca. 1410–12) in the Cathedral in Xanten, together with a cloth in St. Maria zur Wiese, Soest, comprise some of Westphalia's finest examples of linen embroidery. White-embroidered altar cloths such as that with scenes from the life of St. Mary Magdalene in Wernigerode (Fürst Otto-Mus.) equal the noblest products of the graphic arts. The so-called "fast cloths" (*Hungertücher*) found in churches of Lower Saxony, Westphalia, and the Lower Rhine hung before the altar only during Lent and were first mentioned in the early years of the 11th century.

In about 1300 an embroidery from the Upper Rhine (now in Paris, Mus. de Cluny) with scenes from the lives of St. Mark and St. John — among which is one of the earliest of the Christ–St. John groups that were soon to be perfected in sculpture — introduced a rich, painterly style. The choir robes done in opus Anglicum from the middle 13th to the early 14th century are very impressive. One of the most beautiful, from Syon House, erected on the site of an early-15th-century nunnery, is a cope (IV, PL. 12) with the field divided into four panels, in the individual fields of which the life of Christ and the Virgin is embroidered in a wealth of colors that brings to mind Gothic stained glass. Opus Anglicum was in great demand throughout Europe. Examples may be found in churches in Comminges, Toledo, Vich, Bologna, Pienza, Rome (Lateran), and elsewhere.

In the 14th century embroidery, formerly produced in convents and royal courts, was organized into corporations centered in the prospering cities. The names of some of the embroiderers are known: a choir cloak in the Cathedral of Salzburg was embroidered by a "Seidennater" Seidlin von Pettau; in 1336 in Florence one Jacopo Campi made an embroidery with the Coronation of the Virgin among saints under a Gothic arcade; on an altar hanging in S. María de la Seo, Manresa, Spain, can be seen the inscription "Geri de Lapo rachamatore, me fecit in Florentia."

As European panel painting developed, particularly with Jan van Eyck, embroidery followed suit and became needle painting. The embroidered antependium reached a zenith with such images as the Christ surrounded by the Evangelists, commissioned in 1393 by Abbot Arnaldo de Villalba, whose coat of arms appears on it (Vich, Mus. Episcopal), and the Resurrection in the Church of St. Felix, Gerona, unquestionably influenced by Dutch painting, perhaps even by Gothic tapestries from the Netherlands. Thus also an embroidery in the Cathedral of Trent with scenes from the life of St. Virgilius is close to the north Italian painting of the turn of the 14th century.

Linen wall hangings with figural wool embroidery from about 1400, such as those in Kloster Wiengausen near Celle, from Kloster Adelhausen (Freiburg im Breisgau Mus.), and in the town hall of Regensburg, reveal imagination and a folklike delight in narrative, as is also shown in the Bayeux tapestry. The stories of the prophets, of Mary Magdalene, and of St. Thomas, as well as the sagas of Tristan and Percival and scenes of the hunt and other knightly activities, are depicted in bright, gay colors.

Painterly embroidery reached its zenith in the so-called "Burgundian" technique. In a technique comparable to the intensification of the color scale in painting through the use of superimposed glazes or washes, embroidery arrived at somewhat the same effect by superimposing many thin layers of silk threads, mostly over a gold-thread ground, the threads not infrequently being laid in lozenges or other structures so that one layer could be glimpsed through the other. The most important embroideries in this technique, the Burgundian Mass vestments in Vienna (Mus. für Angewandte Kunst), can perhaps be traced back to designs by the Van Eycks. The design of the cope is formed of elongated hexagons in a honeycomb pattern; on a

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

chasuble the Transfiguration is represented in the midst of female and male saints. The embroiderers of these vestments used more than twenty shades of silk. The occasionally sharp relief was obtained by a padding of cloth, parchment, or wood. The eventual enrichment with beads, semiprecious stones, and sequins soon led to an exaggeration of the decorative means and an excess of trimming. Charming alms bags were also done in the "Burgundian" technique, as shown by examples in Paris (Mus. de Cluny) and Xanten (Cath. Treas.). In competition with the *basse-taille* enamels, such furnishings as sudariums, containers for the host, and antependiums were executed completely in bead embroidery, forming a glowing colored-bead mosaic.

Whereas woven borders were made in Palermo and Florence, in Cologne they were both woven and embroidered, and some were initially woven and then finished in embroidery. The patterns were very simple, with blossoming trees, folk and Christian symbols, and coats of arms. Figures of saints were also embroidered over a patterned woven foundation, or a border might be enriched with a woven-in saint's figure. These images, as well as the appliqués which gradually took over in late Gothic needle painting, eventually led to a degeneration of the art. But before then needle painting reached new heights under the early Renaissance painters of Florence, where embroidery flourished up to the middle of the 16th century. Artists such as Antonio Pollaiuolo, Raffaellino del Garbo, Parri Spinelli, and Perino del Vaga prepared embroidery cartoons; and high-ranking embroiderers such as Girolamo Cicogna, Paolo of Verona, Nicola Veneziano, and others were held worthy enough by Vasari to be included in his *Lives*. Antonio Pollaiuolo particularly, who belonged to the last generation of early Renaissance artists and who through his study of anatomy and the living model paved the way for the High Renaissance, is of interest. Vasari has provided detailed descriptions of the embroideries executed on Pollaiuolo's designs, since for the art history of the Renaissance they were of great importance. In the 1480s the Arte dei Mercanti di Calimala commissioned Pollaiuolo to provide drawings for embroideries representing scenes from the life of John the Baptist for two dalmatics, a cope, and a pluvial for the Baptistery in Florence. The embroideries were separated from the garments in the 18th century and are now in the Museo dell'Opera del Duomo (Florence). As in Pollaiuolo's paintings, these drawings also reveal the main problems that occupied most early Renaissance artists: the construction of space using a central perspective and the relationship of the image to the space and the landscape. In one of the embroideries the figures stand in front of a space much like a stage, which is placed in a landscape built up of more or less conventional stagelike requisites. In another series in which the figures are set in a space that follows the rules of central perspective, the embroiderer has marvelously projected himself into the artistic problems.

In the High Renaissance linear embroidery again came to the fore. It had always been practiced, particularly in provincial areas where folk art flourished, as in Umbria, and in Switzerland and other Alpine countries, as well as in Germany, England, and the Nordic countries. As personal and bed linen came into general use, linen embroidery spread throughout Europe. Since it was often white embroidery on white linen, the many varied stitches such as the stem, chain, and braid stitch came into their own. By breaking through the woven foundation, drawnwork offered multiple variations of the ground. Through the appliqué of lighter or darker colored rosettes, flowers, vines, horns of plenty, and other motifs, a low-relief effect was obtained. A specially crocheted net foundation (reticella) was further developed and sewn on in a sort of textile filigree of plant and animal motifs.

In the 16th century, pattern books for embroideries helped diffuse the art. One of the first, called *Eyn New Modelbuch*, was written by Jörg Gastel in Zwickau (Saxony) in 1515 (Dresden, Kunstgewerbe Bib.). Two years later books by Peter Quentel in Cologne and by Christian Egenolff in Frankfurt am Main were published (both, Leipzig, Kunstgewerbe Mus.). The pattern book of Tommaso Gazzoni, *La Piazza universale di tutte le professioni del mondo*, appeared in Venice in 1585. Between 1597 and 1602 one Johann Sibmacher printed many pattern books in Germany. Embroideries, which previously had served to provide the church with furnishings and ecclesiastical vestments, now also came into the service of the citizen and appeared on clothing, bed hangings, and covers.

Multicolored embroideries in all techniques, from stem stitch to cross-stitch to satin stitch, flourished from the 16th to 18th centuries (PL. 24). A Swiss cover (Vict. and Alb.) with the representation of the five senses as women on a vine-scroll ground was done in 1580, according to the date embroidered on it. Sight is depicted as a lady with a mirror and an eagle, Hearing as a lute player with a bear, Taste as a lady with a platter of cakes and a monkey, Smell as a lady smelling flowers, accompanied by a dog, Touch as a lady with a peacock. While this Swiss cover with its Latin inscriptions touches on the world of Humanism, a linen cloth in Troppau (Opava; Slezský Studijni Ústav), brightly embroidered in silk with representations of the Olympian gods assembled on clouds around Juno, leads into the High Renaissance.

Costume embroidery gained considerably in favor during the 17th century, with the introduction of liveries for servants and the change in the military field from mercenary armies to standing armies in standard uniforms. The impresa of the house, rank, and other symbols identifying the troop divisions were embroidered. In the 18th century the heights of magnificence were reached. Embroidery was executed in silk on silk with a plentiful use of gold thread, with much relief embroidery employed to achieve special effects. After the jerkin and doublet were replaced by vest and coat, the borders and cuffs of the coat and the entire vest, often reaching down over the lap, were richly embroidered in bright silks with gold thread (cf. IV, PLS. 15, 28, 29, 31). Ecclesiastical vestments followed this trend toward magnificence, with a high point probably reached in the so-called "Clementina," a 33-piece set of ecclesiastical vestments with figural gold embroidery bought in Lyons in 1742 for Clemens August, Archbishop of Cologne, for a price of 186,000 marks (Cologne, Cathedral Treas.). Cardboard, cloth, and felt formed the padding of the raised gold embroidery. Lyons was the supplier of most of these costly textiles for church and court.

After the French Revolution efforts were made to secure embroidery and textile commissions for high state and military needs, but the conditions specified thrift and simplicity. The foundation material for these works was often tulle and the technique often appliqué; occasionally the embroidery was completed by painting on the cloth. In the 19th century, with the exception of military and court uniforms, embroidery was gradually limited to little more than white embroidery on ladies' clothing and personal and bed linen. On covers, pillows, and furniture upholstery many-colored embroidery still flourished.

In most European countries embroidery became dependent on French fashions in the 18th century. In the north, particularly in Sweden and Norway but also in Germany, England, and Ireland, folk art continued to provide inspiration for a long time. Something similar was the case in the Slavic countries of eastern Europe. In Spain the emanations of the Moorish period lingered on, with embroidered curtains modeled on Moorish silk brocades of the 14th century, particularly those with geometric patterns, still being made in the 17th and 18th centuries.

There was a decided halt in the art of embroidery, which was relegated to folk art after World War I, with the European trend toward extreme simplicity of form. This was, however, followed by a reaction which again brought embroidery to the fore as decorative enrichment. Up to the present, however, the geometric or stylized forms common to almost all of Europe are the prevalent ones, even though each country has also adopted forms from the local craft traditions and reelaborated them.

The Islamic peoples of the East — the Egyptians, Syrians, Turks, and Persians — promoted embroidery from the early Middle Ages on. Mameluke tombs in Cairo, in addition to wool or silk embroideries, have yielded many patterned cloths,

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

often done in a darning stitch, one of the most solid types of stitch, which gives the impression of having been woven in. In addition, all the types of stitches that were known in the West, up to the Holbein stitch, were current.

The Turks took along in their campaigns magnificent embroidered tents, some of which were taken as booty and can be found in various museums (Vienna, Heeresgeschichtliches Mus.; Karlsruhe, Landesmus.). Battle standards and saddlecloths were also often finely embroidered (Vienna, Kunsthist. Mus.). In the 18th and 19th centuries, embroidery, whether cross-stitch or tambour work, was completely dependent on the pile carpet and kilim motifs. For this reason some of it was called "Arabian" embroidery in Europe and was much imitated for pillow covers and bedspreads.

Few embroideries from the early years of China's and Japan's history have been preserved. A Korean embroidery of the Kōrai period (early 14th cent.) with lotus blossoms gives an idea of their fine linear style. Conclusions can perhaps be drawn from the *k'ossŭ* (tapestries). In European and American museums there are many eastern Asian embroideries from the late Middle Ages to the present. As in Europe, gold embroideries were also made in the 18th century; but in contrast to the European striving for relief effects, it remained a surface decoration.

LACE. Linen cloth from which some of the threads have been pulled out to be replaced by needlework results in drawnwork. When some of the fabric has been cut away in squares, circles, and other shapes, also to be filled with needlework, the result is cutwork; but these working procedures are still embroidery, since a cloth foundation remains. As long as there is a cloth base, scanty though it may be, the work cannot be called lace. Not until the thread was conceived of as the formative element, with an independent thread net stretched on a cushion according to an underlying pattern drawn on paper, and this thread was interwoven with other threads with the aid of a needle or a bobbin, did true lacework develop. It thus becomes clear that lace is a free plaitwork, and that its origins can be traced back to the plaitwork in bast,. hair, and thread practiced in antiquity. Plaited-thread headdresses were found in Coptic graves in Egypt, and rods that may have been bobbins have come to light in Etruscan excavations in Italy. But the real history of artistic lace did not begin until the 16th century in Venice, with the *punto in aria* (needle-point lace) — thread drawn freely through space (PL. 23). In this technique geometric figures were drawn as a basis, often according to pattern books such as that of Tagliente, *Esempio di racammi* (ca. 1530). The pattern book entitled *La pompe* (which probably means ornamentation) appeared in 1557 in Venice and is said to be the first in which bobbin lace can be clearly identified. Needle point and bobbin lace seem to have come into being simultaneously in Italy. Christoph Froschhower states in his pattern book, *Nüw Modelbuch*, which appeared in Zurich in 1562, that the art of making bobbin lace had been known in Switzerland for twenty-five years and that it had been introduced in 1536 by merchants from Venice and other Italian cities. One of the favorite instruction books in Italy bore the title *Corona delle nobili et Virtuose donne*, by Cesare Vecellio, 1591, which seems to indicate that noble ladies in particular occupied themselves with lacemaking.

Manufactories for lacemaking in Italy were in Venice, Milan, and Genoa — originally Venice produced more needle-point laces, Milan and Genoa bobbin laces. Up to the end of the 16th century needle-point and bobbin lace went along side by side, so that in the older type of needle-point lace, forms were created that were then also partly executed in bobbin lace.

In the 17th century, lacemaking, subsidized by the state, was also introduced in France. After unsuccessful attempts by Catherine de' Médicis and later Mazarin, in 1665 Colbert, the creator of the mercantile system, founded a society that had a monopoly of lacemaking for 10 years, with workers recruited in Venice and Flanders. The most important manufactories arose in Alençon and were supervised by Colbert himself. In 1682 in a letter to the manufactory supervisors he stated that the main defect of the French laces was that they were not as tight and white as those of Venice. Soon, however, the needle-point laces from Alençon excelled all others and were imitated even in Venice.

While needle-point lace was primarily adopted in France, bobbin lace was made in Flanders. In Bruges, Mechelin, Brussels, and especially in Valenciennes, which then still belonged to Flanders, important manufactories for bobbin lace were created. Bobbin lace was also made in Germany (Schneeberg, Annaberg in the Harz Mountains), Austria (Vienna), Dalmatia (Ragusa), Switzerland, Ireland, England (Buckinghamshire), and Spain.

The working material of lace is usually a fine linen yarn. In France and Spain laces called "blonde," probably from the yellowish cast, were also made from silk. The dark and black silk laces from Chantilly were particularly sought after, but generally needle-point and bobbin laces used very fine linen threads, some old lace being so fine that 222 threads laid side by side measure less than 1/2 in. They were surpassed in fineness only by ancient Egyptian linen textiles.

The making of bobbin lace requires a cushion on which is laid the pattern sheet with the design drawn on it. Marking needles are inserted in essential spots of the composition. The bobbin is a wooden stick about 4 in. long with a spool at the upper end, giving it a shape somewhat like that of a bell clapper. A bobbin is held in each hand, and the threads are then cast like a lasso around the marking needles. The bobbins are simultaneously twisted and crossed so that the threads form an interweaving. Through the twisting of the bobbins the right thread of each pair of bobbins is laid over the left, and in crossing the left of the two central threads is laid over the right. Until the end of the 16th century bobbin-lace patterns were achieved with this simple casting and a multiple plaiting, made from the casting of the two bobbins. Then were added the pattern pieces in the form of square or curved woven designs. There can be as many as 14, 18, or 20 (rarely more) bobbins, always, however, moved in pairs. Milanese bobbin lace has a characteristic narrow bobbin-made band edged by a sort of hemstitch. This was joined to the neighboring piece with tie bars, or "brides," later by a fine-meshed net. The bobbin laces from Genoa and other Italian cities lack this band in their ornament.

Soon after the middle of the 16th century, when the Spanish style set the fashion in Europe, one item of wearing apparel — the collar — contributed largely to the demand for lace. Invented originally to separate the washable from the unwashable part of the garment, this collar soon assumed grand proportions and was starched to frame the face and features in a ruff. Cuffs and the bands on breeches were also decorated with lace, as can be seen in Rembrandt's portrait of Maerten Day (Coll. Baron de Rothschild). Rubens, Veronese, and many other portraitists of the period were obviously intrigued by the possibilities for achieving interesting textures in the representation of lace (cf. PLS. 344, 346; IV, PL. 28; XII, PL. 325). In French fashions lace was also used on the breeches at the knees. Many seams were trimmed with lace, which sometimes fell in cascades. When the neck ruff went out of fashion, luxurious lace cravats were introduced. The luxury of lace can be imagined from a cartoon for a painting by Etienne Jeurat in Versailles which represents the meeting of Philip IV of Spain with Louis XIV on Pheasant Island in the Bidasso River. The Spanish king was accompanied by his daughter María Theresa, future wife of Louis. The French king wears Venetian needle-point lace in large vine-scroll designs, and the Infanta wears lace similar to that shown in Velázquez' painting and apparently of Netherlandish origin. These simple Dutch bobbin laces were also called "Velázquez" laces. In portraits by Van Dyck (IV, PLS. 304, 308) and Rembrandt (XI, PL. 456), only the lightly starched flat collars are generally of such bobbin lace.

In the extant laces of the Renaissance and the baroque there can be seen the change from a linear, finely drawn style in lace to a figural, more painterly style. In the 16th and 17th centuries the relationship of ornament to ground was conceived in a purely linear fashion, with a light relief occasionally attempted

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

in the bobbin lace of Milan and Flanders. In Flanders an important lace industry was already in existence in the 16th century. Flemish laces with figural motifs (PLS. 23, 27, 29) are to be found in Brussels (Mus. Royaux d'Art et d'Histoire) and in London (Vict. and Alb.) with Roman emperors and their arms in the former (PL. 23) and with Philip IV and the Order of the Golden Fleece in the latter. Bobbin lace was introduced into Saxony by Dutch emigrants who left their homes at the time of the Inquisition. French emigrants who left their native land after the Edict of Nantes had been revoked animated the lace industry in Ghent and Neufchâtel. Emigrants from the Netherlands and France were also responsible for the considerable rise in lacemaking in England.

The development during the 19th century of lacemaking machines, which could produce laces that were difficult to distinguish from the handmade varieties, threatened the art of lacemaking. But handmade laces of high quality continued to be made in almost all of the traditional centers of the craft in Europe, generally elaborating or repeating traditional techniques and decorative forms. The 19th- and 20th-century pieces, however, reveal a derivation from fashions inspired by contemporary tendencies in figural art. France, which had long remained in the lead, especially after Colbert's laws, again ceded its place toward the end of the 19th century to Italy, where, particularly after the reorganization of the women's industries of Burano (1872) and after the successful affirmation of the Jesurum in Pellestrina, production continued uninterrupted. In Italy, as elsewhere, there is a lively craft production side by side with the industrial production keyed to a wide commercial distribution.

FOLK TEXTILE ARTS. In folk art artistic emanations from the so-called "high" cultures play a large part. For example, much of European folk art owes its form to baroque art; this applies also to textiles. Ever since, in the 19th century, industry, with the help of the Jacquard machine, took over much of the weaving of textiles for the traditional folk costumes, weaving as a folk art has greatly declined, but it still exists. The serious study of folk art did not begin until well into the 19th century, and not until then were valuable early examples collected. The element that particularly distinguishes folk art from fine art is its lack of participation in the style changes caused by the search for new forms; this does not mean that there are no problems of form in folk art, but that they stand in closer rapport with the craft proceedings. Particularly in folk art, the skillful handling of material, tools, and forms must be learned, and this together with the related joy of discovery comprises the essential creative impulse.

One of the oldest weaving methods was loop weaving, already known in the early history of man and used in the robes worn by the kings and priests of Sumeria. It seems to have been an attempt at the imitation of the fur pelts which Stone Age men used as clothing and which are still used by Eskimos and other primitive peoples. The technique is still used, for example, in the foundation of the modern loden cloth.

White linen was probably one of the earliest textiles to stem from folk art. Examples are still made in Umbria (PL. 18) according to a tradition that goes back at least to the 12th and perhaps to the 11th century. This compound fancy cloth, which usually has a bird's-eye design in the foundation weave and blue stripes, generally in cotton, patterned with birds, lambs, stags at a well, horses, leaves, and flowers, was generally intended to serve as table linen. The tablecloth in Ghirlandajo's *Last Supper* (Florence, Ognissanti) is such a cloth from Perugia. An inventory made in 1482 of a collection in Perugia mentions such a textile destined for the high altar, which was said to represent lions and dragons in the style of Perugia.

Like the desert sands of Egypt, the bogs of the Nordic countries have also preserved textiles throughout the ages. Entire garments of sheep's wool have been found on the Ice Age corpses yielded by the moors in the province of Hannover (Obereltendorf, Bernuthfeld) and in Torsberger Moor near Süderbrarub (Schleswig-Holstein), in Eskoj, near Aarhus, and in Tollund in Jutland, to mention only a few. Particularly important are belts, such as that found on a man's garment in Eskoj and the woman's belt now in Arolson (Fürstliche Mus.). Vivi Gylvan (1931), who has extensively studied the textile art of the Nordic lands, has also published a work on tablet weaving, a system by which the bands and belts so important in folk art were made. She came to the conclusion that at about the beginning of the Christian Era tablet weaving existed in both Gaul and the Nordic countries. It was unknown in ancient Egypt, in Greece, in Asia, and in pre-Columbian America but was practiced in Islamic lands from the 10th century on and flourished in Sicily from the 10th to the 13th century, even after the Norman conquest and under the Hohenstaufen rule. From the 14th century on it survived only as a folk art. This is a good example of a folk art becoming a fine art and then returning to the realm of folk art, with its characteristic elements retained throughout its history. Similar cases are linen weaving in Perugia and the Nordic double weaving and loop weaving. These Nordic double-woven cloths, such as the example with horses and birds from the Radakirche in Värmland (Sweden) and the one from the church of Overhogdal, are related in appearance to the Perugian products. In Bohuslän (Sweden) textiles such as the one from the Radakirche with geometric, strongly stylized lions, leopards, and people were still being woven in the 19th century in almost identical form. As has been said, this is characteristic of true folk art, which changes little in form or style over the centuries. The Bayeux tapestry, representing the Norman conquest of England in the 11th century (PL. 312; VII, PL. 271), and a 12th-century wall hanging with a stave church and a wooden bell tower surrounded by human beings and animals in Skog (Sweden; IV, PL. 176) are based on similar peasant foundations, and thus are similar in style.

The elementary necessities of life among all peoples led to similar developments in the crafts. They varied according to environment, climate, and other circumstantial influences, but their relationship in technique cannot be denied. Influences also passed from one folk to another. Mention has already been made of the Arabian influence on Italian textile art; Asian influences also reached northern Europe. In the Middle Ages trade relations existed between the Turkic peoples and Sweden via the Baltic through Russia to the Black Sea. The so-called "Marby rug" (XIII, PL. 415), found in Marby (Jämtland, Sweden), is evidence of this.

The fact that the art of knotting carpets was known in Europe as well as in the East is testified by a picture carpet in Quedlinburg showing the marriage of Mercury with Philology, made under Abbess Agnes of Meissen (ca. 1300). Lower Saxony had a flourishing folk art of both tapestry-woven and embroidered picture carpets and white-linen embroidery, as well as the particularly charming loop-woven textiles, which had a wider diffusion than is generally supposed; examples have been preserved in Italy and Spain as well. In the Nordic countries — Finland (Ryo), Sweden, and Iceland — and in East Prussia and Schleswig-Holstein loop-woven textiles were made, serving usually as wall hangings, covers, and pillow cases (in Schleswig-Holstein also as horse blankets), in which a particularly high point was reached in the creation of reversible fabrics of wool and linen. Westphalia, Saxony, lower Austria, and Czechoslovakia (Mähren) all produced excellent damask table linens with characteristic folk motifs.

The textile art was receptive not only to the old folk traditions, but was also widely influenced by the formal language of baroque art. This can be established in weaving, in embroidery, and particularly in lace, which was widespread as a folk art and became a craft of importance from the baroque period on. In addition to the Italian, French, and Belgian cities where lace achieved its highest perfection (see above), it was also made in many Italian centers — Piedmont, Lombardy, Liguria, Sardinia, the Abruzzi (Aquila, Pescoconstanza), and the Campagna Romana. Lacemaking also flourished in Crete, whose gold bobbin lace was especially prized. In Dalmatia, where the fronts of the men's shirts are partially covered with large lace insets, in Hungary, in Czechoslovakia (Bohemia), and in Poland bobbin lacemaking was practiced as a folk art, as it was in certain areas of Sweden (Småland, Skåne, Dalarna). In the eastern European countries such as Czechoslovakia,

Poland, Hungary, Yugoslavia, Albania, Bulgaria, Rumania, and Russia the folk costumes are characterized by brightly colored wool embroidery and rich white linen and cotton embroidery used in a multitude of ways on jackets, bodices, shirts, aprons, scarves, and kerchiefs.

Despite a long period of Turkish occupation, the Greeks preserved their traditional folk art in a comparatively pure form. Gay flowers executed in wool or silk embroidery embellished by much gold thread were used on clothing, cushion covers, aprons, borders, and belts. Drawnwork and bobbin lace, including gold lace, played an important part in this folk art. Ancient motifs such as the palmette and lotus tendrils were adapted and stylized but are still recognizable in their new contexts.

In the western European countries folk textiles came more or less under the influence of the French baroque; in Spain and Portugal Moorish influences were strong. Medieval traditions continued for a long time in British textiles; these were successfully combined with baroque influences from France and the Netherlands as well as with Indian influences.

Despite the efforts of John Ruskin, William Morris, and their followers, mechanization and industrialization soon engulfed the textile arts and, of course, inevitably affected the production of folk art, as did also, and perhaps more drastically, the increasing urbanization of modern life. But folk art is far from dead in Europe, and the mid-20th century saw many interesting efforts (such as the artisan's cooperative in Italy) to keep it alive and to strengthen it.

THAILAND. A kingdom occupying the center of the southeast Asian peninsula, formerly called Siam. The name Thailand is a translation of Müang Tai, the official spelling, Thai, being a relic of French missionary efforts in the 17th century. The name (written Dai) is first attested in Râm Kamhèng's inscription of 1292 (Bangkok, Vajirañāna Lib.). The name Syam is attested in the 11th-century Cham inscription of Po Nagar at Nhatrang (Vietnam), in the 12th-century bas-reliefs at Angkor Wat, and often in Ayudhyan literature.

The art and architecture of Thailand are exceedingly rich and varied (see SIAMESE ART). Though large numbers of Chinese have emigrated into the region over a period of centuries, Chinese art has had little influence except in a few specialties (e.g., in ceramics, occasionally in painting, and in some 19th-century architecture). The main art traditions stem, either directly or through Cambodia (q.v.), from India (see INDIAN ART) — Amaravati, Pallava, post-Gupta, Pala (see PALA-SENA SCHOOLS) — and from Ceylon (Anuradhapura, Polonnaruva; see CEYLONESE ART). Some writers who know the art of India better than that of Thailand regard the latter as a degenerate provincial manifestation of the former: an error that may be excused on the grounds that only a minute portion of the glories of Siamese art has been published in the West.

Throughout the historical period the religion of most of Thailand has been Theravāda Buddhism (see BUDDHISM). During the Śrīvijayan period, however, Mahayana Buddhism predominated in the Malay Peninsula, being succeeded by Islam south of Songklâ (Singora) and by the Theravāda north of it. In Dvāravatī the Mahayana played a minor role, but during the Khmer occupation (see KHMER ART) it enjoyed official sanction, only to disappear afterward. The Hindu cults have traditionally been held in high esteem by the Buddhist majority, but less as a religious faith than as a support of monarchy and good government.

ART CENTERS AND SITES. The most important art centers and sites are listed alphabetically below.

Ayudhyā. Founded in 1350, Ayudhyā was the capital of a Tai kingdom that, from the 15th century on, dominated the whole of Siam and exercised a more or less effective suzerainty over Cambodia. The kings regarded themselves as inheritors not only of the Tai traditions of Sukhodaya (Sukhothai) but also of the Khmer traditions of Angkor. In 1569, when the city of Ayudhyā had a larger population than the London of its day, it was conquered by the Burmese, but a few years later recovered its independence. In the 17th century Ayudhyā welcomed foreign diplomats, missionaries, and merchants, several of whom have left interesting accounts of the place, but in the 18th century a reaction set in and few foreigners visited Siam. In 1767 the city was captured by the Burmese and a large part of it destroyed. When the Burmese were expelled and order was restored, the capital was transferred to Bangkok.

The city plan of Ayudhyā was governed by the nature of the site, an island at the confluence of the Lopburî (Lop Buri) River with the Mè Nâm (Jao Pyâ, Chao Phraya).

The National Museum, housed partly in the old buildings of the Candrakṣema Palace in the modern town and partly in a new building outside it, contains a large collection of antiquities, mainly sculpture, of various schools from the Dvāravatī period up to modern times. Most richly represented are the Early Ayudhyā or "Û Tòng" styles (14th–15th cent.) and the Ayudhyan National style (15th–18th cent.).

The Siamese *prāṅg* is commonly said to be a derivative of the Khmer *prāsāda*; but in fact it derives from a local type of sanctuary tower, Khmerizing but not Khmer, of a sort whose earliest surviving representative is the Devasthāna at Lopburî (10th cent.). The connecting link between that and the Ayudhyan *prāṅg* is the Mahādhātu (Great Relic) at Lopburî (13th cent.). None of the great *prāṅg* temples at Ayudhyā preserves the forms of the 14th century. Buddhaiśvarya, founded in 1353, was rebuilt in the 18th–19th centuries; Braḥ Rāma, although founded in 1369, dates for the most part from the first half of the 15th century; the *prāṅg* of the Mahādhātu, built in 1374, has disappeared. Rājapūraṇa was built about 1424 and Jayavaḍhanārāma about 1630. Architecturally, therefore, Braḥ Rāma and Rājapūraṇa date from the early Ayudhyā period, and although both were repaired in the 18th century their essential character was not changed. The crypt of Rājapūraṇa, opened in 1957, was found to contain wall paintings, hundreds of images (chiefly "Û Tòng" styles B and C), and much treasure.

In the reign of Paramatrailokanātha (1448–88) Sukhodayan forms and styles, which had been influential at Ayudhyā since the 1420s, became predominant. From this time on the type of monument most frequently built at the capital was the "Singhalese" bell-shaped stupa. The Chapel Royal, Wat Pra Sî Sanpet (Śrī Sarvajña) — built by Paramatrailokanātha on the site of the former palace of the founder of Ayudhyā — contains a great number of stupas erected over a long period of time for the relics of kings and princes; the three largest were built between 1492 and 1540 (one of them was excavated in 1932, disclosing a great deposit of images). The great bell-shaped stupa of Wat Yai Jayamaṅgala (founded in the 1360s) dates from the late 16th century. There are many others, of uncertain date. A different type of *cetiya*, bell-shaped in outline but square in plan with deeply recessed angles, was introduced in the 16th century. The two best examples are the Cetiya Śrī Sūryodaya and the Pû-kao Tòng ("the golden mountain"). The Khmerizing style of temple with a *prāṅg* was revived by King Prāsāda Tòng (r. 1630–55), founder of the Jayavaḍhanārāma. He built monuments of other types too, including an enormous "copy" of Angkor Wat at Nagara Luang (Nakòn Luang), north of Ayudhyā.

In the reign of King Nārāyaṇa (1656–88) several European ideas were introduced into Ayudhyan architecture: the radiating arch, large windows without claustra, and the use of masonry for certain residential buildings. The windows without claustra have been standard for viharas and similar structures ever since, but the other two innovations dropped out of use after King Nārāyaṇa's death. King Paramakośa (r. 1733–58) repaired a great many ancient monuments, respecting their original forms as few later restorers did.

Three enormous Buddha images deserve notice. That at Wat Pnan Chyög, on the south bank of the river opposite the town, is a seated figure of masonry and stucco about 60 ft. high, built at an unknown date and encasing an image founded in 1324. The Maṅgalapabitra, near the Chapel Royal, is another seated figure, made of bronze plates over a masonry core; it is about 45 ft. high and probably dates from the 16th century. The reclining Buddha at the Lokyasuddhārāma (17th–18th cent.) is made of brick and stucco and is over 90 ft. long.

Sterenstein, "Krung Kao": The Old Capital of Ayutthaya, J. of the Siam Soc., LIII/1, 1965, pp. 83–121.

Bâng Ba-in. At this site, on the left bank of the Mè Nâm (Jao Pyâ) about 12 mi. south of Ayudhyā, a summer palace stood in the 17th century. The present palace, dating from the reigns of Rāma IV (1851–68) and Rāma V (1868–1911), has an elaborate reception hall in the Chinese taste, presented by the Chinese merchants of Bangkok, and a charming water pavilion in the best Tai style.

Bibliog. Damrong Rajanubhab and E. Seidenfaden, Siam Guidebook: Bangkok, Bang-Pa-In, Ayudhya and Lopburi, Bangkok, 1930; T. Amatyaku, Guide to Ayudhyā and Bang-Pa-In, Bangkok, 1956.

Bangkok (Grung Tép, Krung Thep, "city of the devas"). The old town of Bâng Gòk ("place of the *Elaeocarpus madopetalus*"), often referred to by European writers of the 17th century as "Bancok," became the capital of Siam in 1782.

Seen from the river, the Royal Palace presents a fantastic silhouette of soaring roofs and spires. Two of the three halls of audience, the Tuṣitamahāprāsāda and the Amarindravinicchaya, are fine examples of traditional architecture (late 18th cent.). The precinct of the Chapel Royal (Wat Pra Gèo Amarakata), in the eastern portion of the palace, is enclosed in a rectangular gallery that is enlivened with wall paintings of the successive episodes of the *Rāmakirti* (Siamese version of the *Rāmāyaṇa*). The *uposathāgāra*, built in 1785, has excellent wall paintings of the mid-19th century. The place of honor in this building is occupied by the palladium of the kingdom, the "gem-stone Buddha image" (15th cent.?), usually called in English the "Emerald Buddha" although the material is certainly not emerald (perhaps it is jade or jasper). Behind the *uposathāgāra* are two small viharas containing wall paintings of the history of Ayudhyā and the history of Bangkok; the first of these, by the mid-19th-century painter In Kóng, are particularly fine. The Mahāmaṇḍapa is a tall structure covered with glazed tiles. The precinct also contains the pantheon, the library, numerous *cetiyas*, and other buildings, as well as a model of Angkor Wat built in the late 1860s.

The largest monastery in the kingdom, and one of the most beautiful, is the Jetavanārāma (Wa Pó), the greater part of which dates from the reign of Rāma III (1824–51). It contains more than 600 bronze Buddha images of life size or larger brought from Ayudhyā and the old kingdom of Sukhodaya in the reign of Rāma I (1782–1806) and many others brought later; it also has a reclining Buddha over 130 ft. long, made in the 1840s, of gilt lacquer over stucco and masonry, the soles of the feet inlaid with mother-of-pearl. The Sudarśana Monastery (Wat Sutat), which dates mainly from the first half of the 19th century, is notable for its fine wall paintings (with genre scenes introduced into episodes from the life of the Buddha) and for an important Buddhist relief of the Dvāravatī period, brought from Nagara Paṭhama (Nakhon Pathom). The Monastery of the Excellent Abode (Pavaranivesa) has mid-19th-century wall paintings in a romantic semi-European style by In Kóng, a 15th-century stone Buddhapāda ("footprint" of the Buddha) from Sukhodaya, a Sukhodaya reclining Buddha, and two Buddha images from Biṣṇuloka (Pitsnulók, Phitsanulok). There is a traditional belief that these last two images were cast at the same time as the Jinarāja, but the style indicates a later date. In the Monastery of the Fifth King (Peñcamapabitra), built about 1900, an important collection of Buddha images is exhibited. The Rājapabiṭṭa Monastery, built in the reign of Rāma IV (1851–68), is noted for its elegant mandapa and other buildings faced with ceramic tile and for its funerary monuments in diverse styles commemorating various princes. Among Bangkok's many other interesting monasteries are Wat Rājapratiṣṭha, Wat Srakeśa (with its huge artificial mountain, the Pû-kao Tòng), Wat Mahādhātu, and Wat Sâm Plüm.

The former palace of the Wang Nâ prince (late 18th and early 19th cent.) is largely occupied by the National Museum. One of the old palace buildings, the Buddhaiśvarya hall, has wall paintings (late 18th cent.) that are among the finest in the kingdom; another, the Vajirañāna Library, houses a splendid collection of stone inscriptions, old manuscripts, and lacquered bookcases. The Damnak Dèng ("red pavilion"), the residence of the widow of Rāma II (r. 1806–24), was brought from Tonburī (Dhon Buri, Dhanapurī) and reerected here. The compound is dominated by the new buildings of the National Theater and the National Museum. The museum collections, housed partly in the new buildings and partly in the Buddhaiśvarya hall and the old residence of the Wang Nâ prince, are extremely rich. They include mesolithic and neolithic artifacts; bronze drums and other objects of the protohistoric period; sculpture in stone, bronze, terra cotta, and stucco, ranging from the Dvāravatī period to modern times; votive tablets and pottery of all periods; "Svargaloka" and Sukhodaya glazed ceramics; Chinese porcelains made for the Siamese market (18th–19th cent.); wood carvings, chariots, sedan chairs, ornaments from royal barges; the paraphernalia of monastic and court life; and coins, jewelry, puppets, games, and musical instruments.

Between the National Theater and the river is Wat Pra Gèo Wang Nâ, the old chapel of the Wang Nâ prince, with its beautiful wall paintings of the history of the "Ceylon" Buddha; this structure should not be confused with the Chapel Royal (Wat Pra Gèo Amarakata).

Suan Pak-gât Palace, the residence of H.R.H. the Princess of Nagara Svarga (open to the public several days a week), contains a masterpiece of Ayudhyan architecture and graphic art, the Lacquer Pavilion, which formerly stood in a monastery on the bank of the Mè Nâm (Jao Pyâ) south of Ayudhyā. Another building in the palace houses a collection of sculpture and other antiquities. A third is used for exhibitions of the works of contemporary Siamese painters.

J. H. W. Thompson's house at 6, Soi Kasem II, also open to the public several days a week, is an assemblage of seven houses built in traditional Siamese architectural style, dating from the 18th and 19th centuries. It forms an appropriate setting for the owner's remarkable collection of sculpture of various periods from Dvāravatī to Ayudhyā, Siamese paintings of the 17th to 19th centuries, and Siamese and Chinese ceramics.

Bejrapurī (Petburî, Phet Buri). The province of Bejrapurī, long in the orbit of Dvāravatī, became part of the Khmer empire in the 12th century (it is mentioned in 1191 in the Prah Khan inscription at Angkor). At the end of the 13th century it was part of the kingdom of Sukhodaya, being mentioned in the epilogue to Râm Kamhèng's inscription. From 1350 on it formed part of the kingdom of Ayudhyā.

Sculpture of Dvāravatī style has been found at or near the town of Bejrapurī. Wat Gampèng Lèng is a Khmer temple dating from about 1200. Several monasteries contain structures dating from the Ayudhyā period. Wat Yai Suvaṇṇārāma has an *uposatha* hall with wall paintings of the first half of the 17th century, a vihara with paintings of the early 18th and late 19th centuries, and an interesting set of pictures by the last four generations of artists trained in the monastery. Wat Gō Gèo Suddhārāma has wall paintings dating

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

from 1734. The *prāṅg* of the Great Relic Monastery dates from the 19th century. On a hill at the edge of the town stands the Nagaragiri Palace, built in a delightful mixture of Siamese style and *chinoiserie* by Rāma IV (r. 1851–68).

Lunet de Lajonquière, Le domaine archéologique du Siam, B. de la Commission Archéol. de l'Indochine, 1909, pp. 208 ff.; T. C. Bowie, ed., The Arts of Thailand, Bloomington, Ind., 1960 (cat.), pp. 168, 172, fig. 160; E. Lyons, Thai Traditional Painting, Thai Culture, N.S., XX, 1963; J. Boisselier, Les peintures murales de Wat Ko Keo Sutthārām (Phetburî), Felicitation Volumes of Southeast-Asian Studies Presented to H. H. Prince Dhaninivat . . . , Bangkok, 1965, III, pp. 339–45; Fine Arts Department, Guide to Phra Nakhon Khiri, Phetburi, Bangkok, n.d.

Biṣṇuloka (Pitsnulók, Phitsanulok). Mentioned in the Sukhodaya inscriptions under the name of Sòng Kwè ("confluence"), this town was one of the bastions of the old Sukhodaya kingdom. Its chief prosperity was in the 15th century and later, when it was the seat of the Ayudhyan viceroy who ruled the Sukhodayan provinces, and for a time (1463–88) it was the residence of the king of Ayudhyā.

The "Golden Cetiya" (Cetiya Tòng), near the Araññika Monastery, probably dates from the 1360s. The Great Relic Monastery, whose *prāṅg* dates from 1482, houses the famous image called "Braḥ Buddha Jinarāja," a work of the postclassic school of Sukhodaya. The vihara and galleries preserve much of the spirit of Sukhodayan architecture. There is a small museum in this monastery. The Culāmaṇi temple near Biṣṇuloka was built (or rebuilt) in 1464 in Khmerizing style with beautiful stucco ornamentation.

Philosophical Soc., N.S., XLI/1, 1951, pp. 182.

Chaiyâ (Jaiyā). The main *cetiya* of the Great Relic Monastery, though much restored, retains something of its Śrīvijayan form (9th–10th cent.?); it is built of brick laid without mortar, now largely hidden by stucco. Of similar construction is Wat Gèo, of which only a fragment survives. The neighborhood of Chaiyâ has yielded a quantity of sculpture attributable to Śrīvijaya (now Bangkok, Nat. Mus.) and to later schools (much of it now in the Great Relic Monastery in Chaiyâ).

Chieng Mai. The Tai monarch Meng Râi founded Chieng Mai ("the new city") in 1296 and made in the capital of Lân Nâ. Its golden age of art and letters was initiated by King Tiloka (r. 1441–87). It was conquered by the Burmese in the mid-16th century. In the early 18th century they were expelled, and for a time the city maintained a precarious independence. Toward the end of the century, after being devastated in further wars with the Burmese, it was deserted for two decades. It was rebuilt under a new dynasty that ruled under the suzerainty of Bangkok; eventually, together with the rest of Lân Nâ, it was incorporated in the kingdom of Siam.

The city plan is practically square, about 3,300 ft. on each side. The walls were built at the end of the 18th century. The old city may have been larger: the chronicles speak of it as being 1,000 fathoms by 900, which, if the fathom then had the same value as now, would make about $1^1/_4$ by $1^1/_8$ mi.

The Foursquare Cetiya (Cetiya Sî Liem) was built by King Meng Râi. Its form echoes that of the larger of the two monuments at Wat Kūkut (see Lampûn), but it has been spoiled by a modern restoration. The *cetiya* at Wat Chieng Man was also founded by Meng Râi; the present monument, with elephant supports, is an encasement dating from 1471, somewhat altered by later restorations.

At the center of the old city was the Mahācetiya Luang or Rājakūṭa, begun in 1401 and finished in 1481 on a modified plan. It was the magical center of the kingdom, a pantheon with shrines for the Buddha images that were the palladiums of vassal princes, kept there as hostages for their loyalty. The Mahācetiya, which was originally over 350 ft. high, was severely damaged by an earthquake in the 16th century. It was a solid monument of laterite and brick, consisting of a pyramidal basement with elephant supports, a main story, and a stupa on top. The main story had a projection on each face pierced with a deep niche for a Buddha image; the niches were roofed with radiating vaults, which are fairly common in the architecture of Lân Nâ but practically unknown in other parts of Siam before modern times. The stupa was round with an octagonal base.

The Flower Garden Monastery (Wat Suan Dòk, Pupphārāma) was built in 1371 for the same Mahāthera Sumana for whom Wat Pra Yün had been built at Lampûn (Lamphun, Haripuñjaya) two years before. The main *cetiya* probably dates from that time but was refurbished in the 1950s in an unsightly manner.

Wat Umoṅga, about 2 mi. west of the city, has an extensive system of artificial caves dug into a cliffside, containing cells for meditation; according to tradition, they were made by King Gü Nâ (r. 1355–88). On top of the hill above them is a bell-shaped stupa, which may date from the same reign or a little later, with beautiful stuccowork of uncertain date.

The Red Forest Monastery (Rattavanamahāvihāra, Wat Bâ Dèng), near Wat Umoṅga, was restored and enlarged by Tiloka (r. 1441–87) for the forest-dwelling monks (*araññavāsi*) of the New Ceylon order. The *cetiya*, now much decayed, has a main story with five niches for Buddha images on each face, a design recalling the lower story of the Foursquare Cetiya; but on top, instead of four more stories, there is a bell-shaped stupa.

The Monastery of the Seven Spires (Wat Jet Yòt, Mahābodhārāmā), built for the same order, was begun in 1455 (see SIAMESE ART). Besides the exquisite *cetiya* which is a "copy" of the Mahābodhi Temple at Bodhgaya, there are remnants of the Sattamahāṭṭhāna, the "Seven Stations" commemorating the seven weeks following the Enlightenment.

The Monastery of the Lion Lord (Wat Pra Sing) was founded in the 14th century. It is impossible to surmise the original form of the *cetiya*, as it has been several times encased. The statue for which the monastery is named is kept in a crypt in the *uposathāgāra*; it is a bronze image of the seated Buddha, about 4 ft. in height, popularly believed to have been cast in Ceylon in the 2d century (judging from the style, it was cast in Lân Nâ in the late 15th century; the head is a modern restoration). Another bronze image, 7 ft. 8 in. high, cast at the Tapodārāma in 1492, occupies a niche at the west end of the large vihara. In one of the chapels there is an ornate reliquary in the form of a mandapa, about 16 ft. high, that may date from the 16th century, with later restorations. The charming library was built in archaistic style in 1920; the lower story is of masonry, ornamented with stucco divinities inspired by those at the Monastery of the Seven Spires, while the upper story is of teak paneling lacquered in red with gilt trim.

Apart from their monumental architecture, the Chieng Mai monasteries are notable for their wooden viharas and *uposathāgāras* with curtain walls beautifully carved in teak and with tall overlapping roofs edged with gilded bargeboards in the form of nagas. These buildings — which despite their air of venerable antiquity mostly date from the late 19th and the 20th century — are honorable reminders of an ancient tradition.

In addition to the monasteries mentioned above, the following deserve to be noted, either for their architecture or for the antiquities they contain: Wat Pâ Bong, Wat Prāsāda, Wat Loka, Wat Rampöng, Wat Gâlogòt, Wat Gao Dü, Wat Siri Göt, and Wat Jaya Braḥ Kirti.

The Chieng Mai Buddhist Institute possesses a small collection of antiquities and a large collection of manuscripts. The private collection of Kraiśrī Nimmānaheminda of Chieng Mai includes some remarkable terra cottas of the Mòn period from Lampûn, as well as miscellaneous antiquities of the Tai period from various parts of Lân Nâ (manuscripts, ceramics, wood carvings, etc.).

Sullivan, The P'ra Sila of Chieng Mai and its Replicas, Essays Offered to G. H. Luce..., Ascona, 1966, II, pp. 175 ff.

Chieng Râi. This old town was Meng Râi's capital in the 13th century before he took Lampûn and founded Chieng Mai. A brick-and-stucco monument popularly believed to contain his relics appears to be a copy of the Mahācetiya Luang at Chieng Mai. The *cetiya* of the Seven Spires, probably built during the Burmese occupation (mid-16th to late 18th cent.), may have been inspired by a recollection of the Mohābodhi Temple at Pagan (it is quite unrelated to the *cetiya* of the same name at Chieng Mai).

Chieng Sèn. The city was founded in 1327. Holt Hallett, who visited the site in the 1880s, describes it as an irregular parallelogram, 11,057 ft. long and about 3,900 ft. wide, protected on three sides by double ramparts and a ditch; the Mè Kóng (Mekong) River had swept away the fortifications on the eastern side. Recent surveys by the Department of Fine Arts confirm his description.

The city, which was deserted for almost the whole of the 19th century, contains numerous ruins. The group called Wat Pra Jao Lân Tòng is probably the Wat Sî Sòng Möng of the chronicles, the magical center of the principality in the 17th and 18th centuries during the Burmese occupation. Some scholars think that Chieng Sèn was the seat of Meng Râi's ancestors in the 12th century and earlier, but no antiquities prior to the 14th century have been discovered there.

Bibliog. H. S. Hallet, A Thousand Miles on an Elephant in the Shan States, London, Edinburgh, 1890; C. Notton, Annales du Siam, Paris, 1926–32, III, p. 78; J. Y. Claeys, L'archéologie du Siam, BEFEO, XXXI, 3/4, 1931, pp. 425–28, pl. LXXX; A. B. Griswold, Five Chieng Sèn Bronzes of the 18th century, Arts asiatiques, VII, 1960, pp. 3–24, 101–20, 199–204; K. Nanadki Nandakīc, An Inscribed Model Vihāra from Chieng Sèn, Essays Offered to G. H. Luce..., Ascona, 1966, II, pp. 121–32.

Dhātu Bnam (Tât Phom, That Phanom). This Buddhist monument on the right bank of the Mè Kóng dates from the second half of the 9th century or the early 10th century. It is apparently the oldest structure of any consequence left standing in Thailand. The remarkable reliefs in carved brick are contemporary with the monument. The cupola was added in the 17th century.

Bibliog. R. S. Le May, A Concise History of Buddhist Art in Siam, Cambridge, 1938 (2d ed., Rutland and Tokyo, 1963), pp. 54–61.

Dong Śrīmahābodhi (Sî-mahâ-pót, Si Maha Phot). It has recently been established that this site was continuously occupied from protohistoric times up to the end of the Angkorian period. Quantities of beads and potsherds have been discovered; relations with Funan have been revealed by the discovery of jewelry similar to that found at Oc Eo. The place was later within the cultural orbit of Dvāravatī and then became part of the Khmer empire.

Gâ Long. The kilns at Gâ Long, in Chieng Râi province, were probably founded in the mid-15th century by potters from the kilns at Śrī Sajjanālaya (where the "Svargaloka" ware was made), and for the next hundred years they produced some excellent glazed ceramics (chiefly "painted wares").

Gampèng Pet (Kāṃbèṅ Bejra=Vajra, Kamphaeng Phet). A center of art production of the Sukhodaya postclassic school, wrongly identified by Fournereau (1895–1908) with Śrī Sajjanālaya. The city, probably founded in the 1360s, has the form of an irregular quadrangle, the long sides of which (one concave, the other convex) are over a mile long, while the ends are $^1/_4$ and $^1/_8$ mi. long. The city walls, of which a large part remains standing, were 15 to 20 ft. high, made of huge blocks of laterite, defended by a series of bastions, and surrounded by a moat. Both inside and outside the town are the ruins of numerous Buddhist monasteries of the late Sukhodaya and the Ayudhyā period. Some splendid bronze statues of Hindu divinities were discovered in the Brahman temple in the town, including a famous image of Śiva cast in 1510 (Bangkok, Nat. Mus.).

Griswold, The Buddhas of Sukhodaya, Arch. of the Chinese Art Soc. of America, VII, 1953, pp. 5–41.

Kórât (Nagara Rājasimā, Nakhon Ratchasima). The city, founded in the Ayudhyā period in a region that had been part of the Khmer empire in the 12th and 13th centuries, is of rectangular plan. A large portion of the city walls is still standing.

An interesting collection of antiquities discovered at Sûng Nön and in various other districts of the province is exhibited in the Mahāviravaṃśa Museum.

In the vicinity of Kórât is Bnam Van (Pnom Wan, Phanom Wan), the site of one of the most important Khmer temples in Thailand.

Lampang. Founded shortly after Lampûn by a scion of the same Mòn dynasty, Lampang was also conquered by the Tai in the late 13th century. Its monasteries, many of them old foundations, have few surviving pre-19th-century structures There are small museums at Wat Chieng Râi and Wat Lampang Luang. At the Island Monastery (Wat Gŏ) there is a beautiful bronze reclining Buddha, cast in 1602. Several small bronzes in private collections, representing the seated Buddha wearing the royal attire, can be identified as replicas of the black stone image of the Buddha Sikhi that was the palladium of the principality.

Bibliog. R. S. Le May, An Asian Arcady: The Land and Peoples of Northern Siam, Cambridge, 1926; R. S. Le May, A Concise History of Buddhist Art in Siam, Cambridge, 1938 (2d ed., Rutland and Tokyo, 1963).

Lampûn (Lamphun, Haripuñjaya). An old town in northern Siam, about 12 mi. southeast of Chieng Mai. According to the chronicles it was founded in the 7th century by the Mòn princess Cammadevī from Lopburî, the wife of the ruler of Rāmaññadesa (the Mòn country). G. Cœdès corrects the chronology, suggesting the 8th century for the date of founding. It remained under the rule of a Mòn dynasty until 1292, when it was conquered by the Tai.

The town plan, defined by a moat and ramparts of uncertain date, is a slightly deformed oval, suggesting the "conch" shape that according to legend inspired it. It is like the town plan that prevailed in Dvāravatī.

The Great Relic Monastery (Mahādhātucetiya) is said to have been founded in the 12th century by King Ādiccarāja, who built a *cetiya* in the form of a *prāsāda* for the relic. In the early 13th century the *cetiya* was encased in a larger one by Sabbāsiddhi (Sabbādisiddhi), and this was in turn encased in a large stupa by the Tai in the mid-15th century. The monument owes its present form to a rebuilding in the early 20th century, when Burmese architecture was popular in northern Siam. In the monastery precinct is an older *cetiya* resembling the larger of the two monuments of Wat Kūkut; it may be a replica of Sabbāsiddhi's monument, erected at the time when the latter was encased. Of the other buildings in this monastery, the oldest date from the late 18th century; most are modern. Housed in two of them is a small museum with an important collection of antiquities (inscriptions, votive tablets, stuccoes, and fragments of stone and terra-cotta sculpture of the Mòn period; and inscriptions, votive tablets, sculpture, bronzes, wood carvings, and ceramics of the Tai period).

The Mahāvana Monastery, just west of the moat, is an ancient site, judging from a few chance finds there, including a stone deer in the Dvāravatī style, evidently intended to accompany a stone Wheel of the Doctrine, and a small bronze Buddha in the Burmese style of Pagan.

Northwest of the city stands Wat Kūkut (Kukkuṭrāmanā), now officially named Wat Cammadevī, with its two old *cetiyas*. The larger one assumed its present form in 1218, when it was rebuilt after an earthquake. It is a slender pyramid of five stories; the top, which must have included the stupa proper and a spire, is broken off. Sixty niches — three on each face of each story — contain standing images of the Buddha, made partly of laterite and partly of terra cotta, with a coating of stucco. Four of the five stories have miniature stupas at the corners. As the eye travels upward the stories decrease in height, with their niches and images diminishing in proportion. A happy optical illusion results, which increases the apparent height of the monument.

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

Beside it is a smaller monument, built on an octagonal plan. The main story has a single niche on each face containing a standing image, and above are two or three shallow stories with a small niche on each face holding a seated image; the crowning story is so decayed that it is impossible to determine its original form. The octagonal monument may be a replica of the old *cetiya* that is encased inside the larger one; if so, it too dates from 1218 but reproduces a form dating from the previous century.

About 5/8 mi. east of the city is the Pra Yün Monastery. In Mòn times there was a stucco image of the standing Buddha here, facing east; its height was 18 cubits (ca. 30 ft.), corresponding to the legendary height of the Buddha himself. In 1369, at the behest of the Mahāthera Sumana, who came from Sukhodaya to settle here at the invitation of King Gü Nâ, three companion images facing the other cardinal directions were added, and a pavilion (mandapa) was built to shelter the four statues. In the second decade of the 20th century the pavilion, which had fallen into ruin, was demolished, and a solid *cetiya* in Burmese style, about half its height, was built over the remains, the fragments of the four images being buried inside it. This *cetiya*, which the scholarly world has generally taken to date from the 14th century, is really the masterpiece of a Lampûn architect, Nân Pañña Möng, who died in 1949.

Lopburî (Lop Buri, Lapburī). Lopburî, the Lavapura or Lavo of the chronicles and the Louvo of La Loubère, ambassador of Louis XIV, was the seat of an important principality in Dvāravatī times, if not the capital of Dvāravatī itself. Its earliest monument is the Devasthāna, a triad of brick sanctuary towers, two of which (10th cent.) are, with the exception of Dhātu Bnam, probably the oldest buildings left standing in Thailand (the third is a 17th-century copy). At Wat Nagara Kośā there is a huge brick base of uncertain date, which supported a structure (a stupa?) that has disappeared.

Shortly after 1000 Lopburî fell under Khmer domination. After intervals of independence it was again part of the Khmer empire in the first half of the 12th century and for a third time in the reign of Jayavarman VII of Cambodia, who mentions the place under the name Lavodayapura in the Prah Khan inscription in 1191, when it was probably the chief stronghold of Khmer power in central Siam. The triad of sanctuary towers known as Prāṅg Sâm Yòt dates from Jayavarman VII's reign (with some later restorations). After his death (ca. 1220?) Lopburî was again an independent kingdom, probably allied to Sukhodaya in the latter part of the 13th century. The sanctuary of the Great Relic (Mahādhātu) dates from this period but was doubtless built on the ruins of an earlier temple; architecturally, it marks the transition to the Siamese *prāṅg*.

Rāmādhipati I, who founded the kingdom of Ayudhyā in 1350, seems to have inherited the province of Lopburî from his father. His son Rāmeśvara (Ramesuan) was viceroy there from 1350 to 1388 (except for a brief interval ca. 1369). The place suffered severely in the Burmese wars of the 16th century but revived after their conclusion. The ruin known as Sân Sûng, a short distance east of Prāṅg Sâm Yòt, is of uncertain date (15th cent.?); it consists of a huge laterite basement, apparently intended for a *prāṅg* that was never built. Also of uncertain date is the *prāṅg* at Wat Nagara Kośā, west of the large brick basement; it is of archaizing style, inspired by the architecture of the Great Relic.

Lopburî according to a French map of the 17th century: (*a*) House and garden of Phaulkon; (*b*) observatory tower of the Jesuits (now known as San Polo); (*c*) Buddhist monasteries; (*d*) royal stables; (*e*) royal garden; (*f*) "Pra Klang's house"; (*g*) "Khorasan building," Persian ambassador's residence; (*h*) market; (*i*) palace enclosure; (*j*) French ambassador's residence, now called "Phaulkon's House" (*from Hutchinson, 1934*).

Lopburî was the favorite residence of King Nārāyaṇa (r. 1656–88). With the aid of French engineers and architects he built a large palace there, partly in European style, where he spent several months of each year. He was the first Siamese monarch to use masonry for residential construction in place of the traditional wood. As a result the ruins of several of the palace buildings — as well as those of his European-style country house at Talé Chupsòn east of Lopburî — are still visible. He also rebuilt and strengthened the city walls, repaired the old monuments, and built several new structures (viharas, galleries, etc.) in the Great Relic Monastery. For Louis XIV's ambassador, the Chevalier de Chaumont, whom he received at Lopburî in 1685, he built a European-style house (FIG. 47). Its ruins are now commonly known as "Phaulkon's House": perhaps after the ambassador's departure the place was acquired by the Kings' Greek Prime Minister ("Pra Klang") Constantius Phaulkon. The latter also owned a house and garden shown northeast of the inner wall of the city (*a*), and the "Pra Klang's house" (*f*) presumably belonged to him too.

After Nārāyaṇa's death the palace remained unoccupied for a long time. It was restored by Rāma IV (r. 1851–68) and given the name Nārāyaṇarājaniveśa. Part of the palace has been converted into a museum, where an important collection of antiquities discovered in the locality may be seen; they range from prehistoric and protohistoric times, through the Dvāravatī and Khmer periods and the periods of independence, up to the Ayudhyā and Bangkok periods.

Subhadradis Diskul, Guide to Ancient Monuments in Lopburi, Bangkok, 1961; Fine Arts Department, The National Museum, Lopburi, Bangkok, n.d.

Müang Fâ Dèt (Mu'ang Fadaet). This site in the province of Kālasindhu was probably the seat of a principality within the orbit of Dvāravatī. The remnants of city ramparts can be seen, as well as mounds that appear to be the remains of monuments; the most interesting discovery is a series of stone bas-reliefs of Buddhist subjects (ca. 9th cent.), in a style related to that of Dvāravatī.

Bibliog. M. C. Subhadradis Diskul, Mueng Fa Daed, an Ancient Town in Northeast Thailand, AAs, XIX, 3/4, 1956, pp. 362–67.

Müang Sémâ. In the Sûng Nön district of Kòrât province there are the remains of a town of irregular oval plan ("conch-shaped"?) over a mile in length, known as Müang Sémâ because it contains a number of rough megaliths set up in such a way as to suggest the boundary stones (*sémâ*) that are used to mark off the consecrated areas of *uposatha* halls. The town was surrounded by ramparts of earth and laterite and a moat. Within the enclosure are several ruins of laterite buildings. A 9th-century inscription was discovered nearby. Not far away, in the Klòng Kwâng Monastery, are a stone Wheel of the Doctrine and a colossal reclining Buddha of laterite and stone; their style is closely related to that of Dvāravatī.

Bibliog. Fine Arts Department, Plan and Report of the Survey and Excavations of Ancient Monuments in Northeastern Thailand, Bangkok, 1959, p. 60; M. Vallibhotama, Guide to Pimâi and Antiquities in the Province of Nagara Rājasīmā (Khôrat), Bangkok, 1962, pp. 12 ff., fig. 5.

Müang Sing. The ruins of what is almost certainly the westernmost Khmer temple ever built are located on the Kwè Nòi (the west branch of the Mè Kóng), not far from the Burma frontier. The temple, built of laterite, stood in the center of a city of square plan, surrounded by a wall of earth and laterite and a series of outer defenses in the form of earthen ramparts. The complex dates from the late 12th century and was never finished. The place is mentioned in the Prah Khan inscription of 1191 under the name Jayasiṁhapura.

Bibliog. E. Lunet de Lajonquière, Inventaire descriptif des monuments du Cambodge, 3 vols., Paris, 1902–12, III, pp. 460–63; E. Lunet

de Lajonquière, Le domaine archéologique du Siam, B. de la Commission Archéol. de l'Indochine, 1909, pp. 206 ff.

Nagara Paṭhama (Nakhon Pathom). The huge Paṭhamacetiya here was begun in the 1860s and completed in the 20th century. It encases an older stupa of hemispherical form, with a *prāṅg* superimposed; a replica, built at the time of the encasement, can be seen nearby. It is possible that the inner stupa encases a series of others, of which the innermost may go back to Dvāravatī times or earlier; but its sanctity and inaccessibility alike prevent excavation.

The present *cetiya*, which is bell-shaped and covered with glazed yellow tiles, is a structure of great beauty. It is surrounded by a circular gallery, in which are exhibited a quantity of statuary, stone Wheels of the Doctrine, and other Dvāravatī antiquities discovered in the neighborhood by chance or by excavation. The courtyard is a garden shaded by ancient trees. A small vihara has been turned into a museum, which contains stucco reliefs and architectural fragments of the Dvāravatī period. In another vihara next to it is one of the masterpieces of Dvāravatī sculpture, a stone Buddha seated in the "European" posture, brought from Wat Braḥ Meru in the 19th century.

The ruins at Wat Braḥ Meru (Pra Mén) were excavated by P. Dupont in 1939–40; he compares their plan (XIII, FIG. 11) with that of certain temples at Pagan. The principal feature of Wat Braḥ Padona (Pra Batón) is a *cetiya* of uncertain date (recently restored) in the form of a truncated pyramid surmounted by a *prāṅg* (the latter was apparently added in the 19th century). A ruined *cetiya* in the same precinct, known as Cūlapadona, was excavated in 1939–40 by P. Dupont and Luang Boribal Buribhand, who suggest that it may have been of the same type as the larger of the two monuments at Wat Kūkut in Lampūn. Several other sites in and around Nagara Paṭhama have yielded Dvāravatī antiquities.

BIBLIOG. L. Fournereau, Le Siam ancien: Archéologie, epigraphie, géographie, 2 vols., Paris, 1895–1908, I, pp. 117–36; E. Bowie, ed., The Arts of Thailand, Bloomington, Ind., 1960 (cat.), pp. 40 ff.

Nagara Śrī Dharmarāja (Nakòn Sî Tammarât, Nakhon Si Thammarat, Ligor). The main *cetiya* of the Great Relic (probably early 13th cent.) is a large bell-shaped stupa of "Singhalese" type, believed to encase a much older monument. The basement, protected by a covered gallery, is decorated with a series of projecting bays with standing Buddha images of stucco in tall niches; between the bays are lower niches from which the foreparts of stucco elephants emerge. These motifs may go back to the Śrīvijaya period but have been much restored. In the same precinct is a small *cetiya* of which J. Y. Claeys (1931) says: "Its plan, that of a large monument reduced to the size of a miniature, recalls the Candi Kalasan in central Java. . . ." This miniature is generally believed to be a copy of the main *cetiya* of the Great Relic before it was encased. The "Yakṣa Cetiya" in the eastern part of the town dates from the 17th century and may be a copy of the Great Relic as it appeared at that time.

Exhibited in a museum in the Great Relic Monastery is a collection of antiquities discovered in the locality, including two statues in a variant of the Dvāravatī style and a few Śrīvijayan bronzes. The palladium of the city, the "Ceylon" Buddha, is housed in a chapel in the precinct of the provincial administration building. It is popularly believed to have been made in Ceylon in the 2d century; the real date is uncertain (16th–17th cent.?), and the image was doubtless made locally. Monasteries and private collections in the town possess a number of copies, one of which is dated 1694.

Nagara Svarga (Nakòn Sawan, Nakhon Sawan). In the 13th and 14th centuries Nagara Svarga was one of the chief vassal cities of Sukhodaya. On top of Kao Gop ("frog hill") there is a stone Buddhapāda and at the foot of the hill a charming little vihara and a *cetiya*, all dating from the late Sukhodaya period.

BIBLIOG. T. C. Bowie, ed., The Arts of Thailand, Bloomington, Ind., 1960 (cat.), pp. 90, 102, fig. 67.

Nân. The princes of Nân were vassals of Sukhodaya in the late 13th century and its allies in the 14th in the struggle against Ayudhyā. The *cetiya* of Wat Pyâ Wat, of the same type as the larger of the two monuments at Wat Kūkut in Lampûn, is of uncertain date. In the 15th century Nân was the seat of a flourishing school of sculpture in the Sukhodaya tradition, as attested by numerous examples, especially four great bronze Buddha images cast in 1426. Nân was conquered by Chieng Mai in 1449, and its sculptors doubtless contributed to the formation of the style of Chieng Mai's golden age.

Payao (Müang Phayao). In the 15th and 16th centuries Payao was an important vassal state under the suzerainty of Chieng Mai. Prince Yudhiṣṭhīra, scion of the old ruling house of Sukhodaya, had been governor of Biṣṇuloka under the suzerainty of Ayudhyā; in order to escape that yoke he transferred his loyalties to King Tiloka and was awarded Payao as an appanage. It seems he brought with him a number of potters from the celebrated "Svargaloka" (Sawānkalók) works and established kilns near Payao, where some fine ceramics have been found in recent years. Payao was also the seat of a considerable school of stone sculpture, the only important one in northern Siam. The Buddhist Institute has established a small museum in one of the monasteries.

Pimâi (Bimāya). One of the three greatest surviving Khmer temples in Thailand is the Mahayana Buddhist one at Pimâi. Built in the first half of the 12th century, it was recently restored by B.-P. Groslier in collaboration with the Siamese Department of Fine Arts.

Pong Dük (P'ong Tuk). Excavations conducted in 1927 by G. Coedès and G. Manfredi disclosed important vestiges of Dvāravat architecture at Pong Dük in Rājapurī (Rat Buri) province (now in the province of Kāñcanapurī). Villagers have discovered numerous antiquities at the same site, including a Ptolemaic bronze lamp (2d–1st cent. B.C.) and several bronze Buddha images of Dvāravatī style (late 8th/9th cent.), which are now in Bangkok (Nat. Mus.). One of the images is usually attributed to the art of Amarāvatī; in reality it is probably a Dvāravatī copy of a Pala model and should be ascribed to the same date as the others.

Dupont, L'archéologie mône de Dvāravatī, Paris, 1959, pp. 103 ff., figs. 340, 341; Fine Arts Department, Guide to Antiquities at Tambol Pong Tuk and Pra Thaen Dong Rang in the Province of Kanchanaburi, Bangkok, n.d.

Rājapurī (Râtburî, Rat Buri). The province is rich in antiquities from the Dvāravatī and later periods. In Jayavarman VII's time it was part of the Khmer empire (mentioned in the inscription of Prah Khan, 1191); at the end of the 13th century it belonged to Sukhodaya (mentioned in the epilogue to Râm Kamhèng's inscription); it was one of the components of the kingdom of Ayudhyā, founded in 1350. The Great Relic Monastery is built on a site where there was a Dvāravatī temple (a few vestiges of which recently came to light during the course of repairs) and later a Khmer temple (of which numerous remains are visible, including a large part of the precinct wall). The *prāṅg* of the Great Relic appears to date from the late 14th or the early 15th century and is one of the few surviving from that period that has escaped subsequent drastic alteration. Exhibited in the monastery is a small collection of antiquities discovered in the locality.

At Kû Bua, a few miles from the town of Rājapurī, there are the remains of a town dating from the Dvāravatī period. Its plan, defined by the remnants of ramparts and a moat, is a slightly irregular rectangle whose length is more than twice its width, suggesting the *dīrgha* plan that some Indian authorities praise as auspicious and others condemn as disastrous. Many remains of monuments, both inside and outside the town, have been excavated in recent years, shedding new light on Dvāravatī architecture. The excavations have yielded

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

much beautiful sculpture and architectural ornament in terra cotta and stucco.

About 5 mi. northwest of Rājapurī is the "Rishi's Cave" (Tâm Rüsî), a natural grotto in the limestone hill called Kao Ngû ("serpent hill"). Carved in relief on the wall of the cave is a figure of the Buddha seated in the "European" posture, of Dvāravatī style, accompanied by an inscription (ca. 7th cent.) attributing the work to "the holy rishi Śrī Samādhigupta."

Sân Gampèng. In 1952 Kraiśrī Nimmānaheminda of Chieng Mai discovered over 80 kiln sites in the district of Sân Gampèng about 15 mi. west of Chieng Mai. Scattered about were quantities of sherds and wasters — as well as a few pieces in good condition — of glazed "painted wares" and celadons resembling those from the "Svargaloka" kilns at Śrī Sajjanālaya. The Sân Gampèng kilns were probably started by skilled potters carried off from Śrī Sajjanālaya in the mid-15th century.

Spinks, A Ceramic Interlude in Siam, AAs, XXIII/2, 1960, pp. 95–110; A. B. Griswold, Notes on the Art of Siam, No. 6, Prince Yudhiṣṭhira, AAs, XXVI, 3/4, 1963, pp. 215–29.

Sarapurī (Sara Buri). At Brah Pāda ("the sacred footprint") near Sarapurī a complex of shrines has grown up around the Buddhapāda discovered at the beginning of the 17th century. The mandapa, of unknown date, has been several times restored. The balustrade of the main stairway leading up the hill to it terminates in a splendid bronze motif representing a polycephalous naga (17th cent.). There is a small museum in the precinct.

Songklâ (Songkhla, Singora). Some of the finest wall paintings in the kingdom are to be seen in the vihara of the Majjhimāvāsa Monastery (ca. 1845). A collection of antiquities dug up at Songklâ, Satīng Pra, and other places in the province is displayed in a small museum in the same monastery. They include neolithic artifacts, Śrīvijayan bronzes, and many pieces of later date.

Bibliog. S. J. O'Connor, Jr., An Early Brahmanical Sculpture at Soṅkhla, J. of the Siam Soc., LII/2, 1964, pp. 163–69.

Śrī Deb (Sî Tép, Si Thep). At Śrī Deb in the province of Bejrapūṛṇa (Petchabûn, Phetchabun) there are the remains of an old town of irregular oval plan containing Khmer ruins of the 11th century. Some of the sculpture found at the site, however, goes back to the 7th century and is of uncertain affinity. A Khmer inscription of the late 6th or 7th century has been discovered about 6 mi. away.

Coedès, Les états hindouisés d'Indochine et d'Indonésie, Paris, 1948, p. 38.

Śrī Sajjanālaya (Sî Satchanalai). The site, about 10 mi. north of the present town of Svargaloka (Sawānkalók, Sawankhalok), consists of two parts — the deserted walled city of Śrī Sajjanālaya (sometimes called Old Svargaloka) and the ruins of Chalieng, about a mile and a half to the east.

Chalieng, located on a narrow point of land where the river Yom describes a hairpin turn, was the seat of the provincial administration in the late 12th and early 13th centuries, when the region was part of the Khmer empire. Some time after the Tai gained their independence the seat of the administration was removed to Śrī Sajjanālaya proper, a mile and a half upstream where the Yom is broken by a series of rapids. From the time when the kingdom of Sukhodaya was at the height of its power in the late 13th century under Râm Kamhèng to its capitulation to Ayudhyā in 1378, Śrī Sajjanālaya was ruled by an *uparāja* (viceroy), generally the eldest son of the king, while the king himself resided at Sukhodaya. Under Ayudhyan rule Śrī Sajjanālaya declined in importance; eventually the place was abandoned and the population moved to the present town of Svargaloka.

The site of Chalieng is now dominated by the *prāṅg* of the Mahādhātu (Great Relic), an Ayudhyan monument built in the 15th century, very probably on top of the ruins of the principal Khmer temple of the place. A little west of it is a small Khmer temple of the *dharmaśālā* type, now known as Wat Jao Jan; it dates from the reign of Jayavarman VII. The precinct of the Mahādhātu is surrounded by a "railing" of enormous blocks of laterite, built by Râm Kamhèng between the years 1290 and 1292. The colossal stucco statue of the walking Buddha was almost certainly erected by him, as were the viharas and galleries surrounding the Mahādhātu (later restored and modified). The beautiful little mandapa of laterite and stucco is attributed to him by tradition, but the attribution is of doubtful value. The huge octagonal stupa of Mòn inspiration is of unknown date.

The Tai city of Śrī Sajjanālaya was much larger. Its walls enclose an irregular quadrangle, of which the longest side (southwest) is about 3/4 mi. in length and the shortest (northwest) about 1/2 mi. The walls, built of large blocks of laterite, average about 16 ft. in height. They are surrounded by a moat on three sides, while the river flows along the fourth (northeast).

At the center of the city is the *cetiya* of Châng Lòm ("surrounded by elephants"), a handsome bell-shaped stupa with elephant supports, begun by Râm Kamhèng in 1285 and completed in 1290. Southeast of it, and on the same axis, is the complex known as Cetiya Jet Tèo ("the seven rows of *cetiya*s"), dominated by a "lotus-bud" tower built in the 1340s in imitation of the newly remodeled Mahādhātu at Sukhodaya (see below). Surrounding it are smaller *cetiya*s of a dozen or more different forms (probably built within the two or three decades following the building of the lotus-bud tower, as funerary monuments for members of the viceregal family). Farther along the same axis are Wat Suan Gèo Udayāna Yai ("monastery of the large precious garden") and Wat Nâng Pyâ ("the queen's monastery"), each dominated by a bell-shaped stupa. At these two monasteries, as well as at Châng Lòm and Cetiya Jet Tèo, there are traces of viharas and other monastic buildings. One wall of the vihara at Wat Nâng Pyâ still stands; it has tall slitlike openings in lieu of windows and is decorated with beautiful stuccowork. Northeast of the Cetiya Jet Tèo is the platform on which the viceregal palace stood, with the Lak Müang at its southwest corner. Scattered through the town and outside the walls are the remains of numerous other monasteries, of which the two most interesting from an architectural point of view are Wat Suan Gèo Udayāna Nòi ("monastery of the lesser precious garden"), north of the palace, and Wat Sara Paduma ("lotus-pond monastery"), south of the city at the foot of Mt. Siripabbata.

Stretching north along the river from the north corner of the city walls are two complexes of kilns. The first, at Bâ Yâng about 1/4 mi. from the city wall, specialized in architectural ornament made of glazed "Svargaloka" stoneware. The second, at Go Nòi, some 2 mi. farther on, made a wide variety of products — figurines, bowls, jars, vases, and many other forms — some in brown-glazed "Chalieng" ware, some in "Svargaloka" celadons and other monochromes, some in "Svargaloka" painted ware. The kilns at Go Nòi had probably been producing the "Chalieng" wares long before the Tai gained their independence (the nomenclature is confusing because, as far as is known, there were never any kilns at Chalieng; but it is too well established to change). The new techniques that resulted in the production of the "Svargaloka" wares were probably introduced in the early 14th century by potters imported from Lungch'üan in China. All these wares continued to be produced until the mid-15th century, when the potters were carried off to northern Siam.

Subarṇapurī (Supănburî, Suphan Buri). The present town of Subarṇapurī, on the river of the same name, appears to have been founded in the 15th century; but antiquities of much greater age have been found at many sites in the province, especially at Û Tòng (see below). "Svarṇapura," mentioned in 1191 in the Prah Khan inscription as part of the Khmer empire, and "Subarṇabhūmi," listed in the early 13th century as a possession of Râm Kamhèng, appear to refer to some town to which the administration of the province was transferred when Û Tòng was abandoned in the 11th century. The same site was doubtless the place that gave its name to "Prince Û Tòng" (the future Rāmādhipati I of Ayudhyā), rather than the site now called Û Tòng.

At Wat Pārileyyaka there is a colossal Buddha image, about 65 ft. high, seated in the "European" fashion, which may date from

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

the Dvāravatī period but has been so much restored that its date is uncertain. The *prāṅg* of the Great Relic probably dates from the 15th century. Numerous stone Buddha images of "Ū Tòng" B and C styles have been found in the neighborhood. Some of the latter are exhibited in the monasteries of the town and others in the National Museum at Ū Tòng.

Sukhodaya (Sukhothai). After liberating themselves from Khmer domination the Tai established the kingdom of Sukhodaya (ca. second quarter of the 13th cent.), which had as its capital the city of the same name in the valley of the Yom. In the late 13th century, under King Râm Kamhèng, Sukhodaya dominated the whole of Siam except Lân Mâ, but declined rapidly in the reign of his son Lö Tai (r. 1299?–ca. 1345). Under Lü Tai (1347–ca. 1373) it regained some of its power. After his death there was a long struggle with Ayudhyā. His son was forced to capitulate in 1378 but revolted soon after. Ayudhyā reconquered the kingdom about 1410 and reduced it to the status of a province in 1438. Sukhodaya was still one of the foremost cities of the kingdom of Ayudhyā in the 17th century but suffered badly in the wars of the 18th century and was finally abandoned. In 1892 when L. Fournereau visited the place, it was inhabited only by a few villagers living among the ruins, most of which were overgrown with forest. In recent years the Department of Fine Arts has cleared the site, taken steps to preserve the monuments, and erected a museum for the antiquities discovered in the old city and its environs (stone statues dating from the Khmer period; inscriptions, bronzes, ceramics, wood carvings, stuccoes, etc., of the Sukhodaya and Ayudhyā periods).

The oldest structure left standing at Sukhodaya is the Śāla Devarakṣa or Sân Dâ Pâ Dèng (San Ta Pha Daeng), a Khmer temple in the northern part of the city dating from the reign of Sūryavarman II (first half of the 12th cent.). Several stone statues of Hindu divinities in the style of Angkor Wat have been discovered in it.

The Khmer temple at Wat Pra Pâi Luang, north of the city, dates from the reign of Jayavarman VII (1181–ca. 1220?). It consisted of a triad of *prāsāda*s of laterite and stucco, only one of which is still standing. The principal object of worship in the temple was a stone statue of the "Jayabuddhamahānātha," the fragments of which were discovered in the ruins. The three *prāsāda*s at Wat Śrī Svāya, in the southern part of the city, were begun in the reign of Jayavarman VII but were left unfinished when the Khmer withdrew.

The *cetiya* of the Mahādhātu (Great Relic), which was the magical center of the kingdom, was probably built by the first king of Sukhodaya (Śrī Indrāditya), in the form of a quincunx of laterite towers of Khmerizing style. In the 1340s Lö Tai remodeled it, using brick and stucco in accordance with the Ceylon tradition, as opposed to the Khmerizing tradition of laterite and stucco that had prevailed before. He encased the central tower in a tall basement, on top of which he built a "lotus-bud" tower (i.e., a miniature *prāṅg* whose false stories are replaced by a bulbous dome in the form of a lotus bud, recalling a reliquary casket). He allowed the laterite towers at the cardinal points to remain but gave them a rich new stucco ornamentation of Singhalese style. At the subcardinal points he added new towers of brick and stucco.

The city was rectangular in plan. It was surrounded by three concentric earthen ramparts with intervening moats (in accordance with the usual practice, the ramparts must have had wooden stockades along the top). The inner rampart measures about 6,000 by 5,400 ft. There was a gate near the middle of each side, protected by a laterite bastion. All this is much as described by Râm Kamhèng in his inscription in 1292.

The physical defenses were supplemented by magical ones. Râm Kamhèng's stone throne, which he installed in the Sugar Palm Grove in the precinct of the Royal Palace in 1292, was charged with such strong magic that the tradition of its potency survived for over six centuries; when the future King Rāma IV discovered it in 1833 in the ruins of the palace it was still an object of fear and reverence to the villagers. The Lak Müang, a pillar animated by a powerful tutelary sprite, stood north of the Mahādhātu. The shrine of the chief tutelary sprite of the kingdom, Pyâ Kapûng, on a mountain southwest of the city, has not survived. The loyalty of the vassals was guaranteed by keeping their palladiums at the capital. Two ancient stone statues discovered at Sukhodaya, of styles quite different from anything else found in the neighborhood, may have been brought there by Râm Kamhèng. One of them, of Dvāravatī style dating from about the 7th century (Bangkok, Nat. Mus.), was perhaps the palladium of Subarṇapurī; the other, of Śrīvijaya style and of somewhat later date (Sukhodaya, Nat. Mus.), may have been the palladium of Nagara Śrī Dharmarāja. After the remodeling of the Mahādhātu in the 1340s, copies of the lotus-bud tower were erected in the principal cities of the kingdom to form a further spiritual link with the capital, assuring the vassals of the king's protection and confirming their loyalty to him.

The palace buildings, being of wood, have vanished; but the site of the most important group of them is marked by a brick platform measuring 40 by 150 ft. and 5 ft. high. The great majority of ancient buildings at Sukhodaya that have left any trace were dedicated to Theravāda Buddhism, and a few to the Hindu cults that were the indispensable support of good government even in Buddhist countries.

The typical Buddhist monastery at Sukhodaya stood in a rectangular precinct, with the main entrance at the east. It was dominated by a *cetiya* that stood on the west–east axis, with a vihara to the east and an *uposathāgāra* to the west. The *cetiya* was most often a stupa of "Singhalese" design, with a bell-shaped dome, a square *karmikā*, and a tapering spire (*chattra*). The vihara (assembly hall) and the *uposathāhāra* (ordination hall) were architecturally similar, but the latter was consecrated and set about with boundary stones (*simā*, *sémâ*) at the cardinal and subcardinal points. These buildings were rectangular in plan, with the long axis following the main west–east axis of the precinct. Their walls, made of wood or masonry, had tall slits in lieu of windows. The interior was a nave, often with one or more pairs of side aisles that were separated from it by rows of wooden posts or masonry columns that helped to support the roof. The latter was of wood, covered with tiles of terra cotta or white-glazed ceramic and terminating at either end in negas or other mythical creatures (either carved in wood or made of glazed ceramic). Sometimes the *uposathāgāra* — or indeed the whole monastery — was built on an island in a pond, as ordinations performed in a place surrounded by water were deemed less liable to be invalidated by some technical flaw. The monks' cells (*kuti*) were wooden huts.

The main *cetiya* was not always a stupa, and many departures from the typical plan are found. At the Mahādhātu after the mid-1340s the main *cetiya* was the lotus-bud tower surrounded by other lesser towers; in the precinct L. Fournereau counted traces of nearly two hundred structures, the majority of them probably small funerary monuments for members of the royal family. Other structures included two *uposathāgāra*s, six viharas, a mandapa, and three libraries. Wat Pra Pâi Luang was another large monastery, to which additions were made over a long period of years; it was dominated at the west end by the Khmer temple and at the other by a pyramidal *cetiya* with rows of niches on each story containing stucco images of the seated Buddha in the preclassic style of the third quarter of the 13th century. A number of viharas and other structures were also erected in the precinct without any rigid plan. At Wat Drapâng Ngön ("silver pond monastery") the *cetiya* was a copy of the lotus-bud tower at the Mahādhātu, but without the lesser towers; at Wat Braḥ Pāda Nòi ("monastery of the smaller footprint"), west of the city, the *cetiya* reproduced the form of a cloth-covered reliquary (probably 16th–17th cent.).

Instead of a *cetiya* there was sometimes a triad of towers. At Śrī Svāya the three half-built laterite *prāsāda*s left by the Khmer faced toward the south, and the Tai did not change the orientation. At first, it seems, they surrounded them with pavilions of light materials and used the place as a Brahman temple; but later on (15th cent.?) they turned it into a Buddhist monastery, completed the *prāsāda*s in brick on a design more like that of a *prāṅg*, and built an *uposathāgāra* and two viharas on the north–south axis.

Another possible substitute for a *cetiya* was a mandapa. The mandapa at Wat Sî Chum ("gathering place of the rishis") has, as its principal object of worship, a huge seated image called "the Unshakable," and there is a famous set of Jātaka engravings on stone inside the tunnel-like stairway within the thickness of the wall. The exterior walls of the mandapa at Wat Drapâng Tòng-lâng ("monastery of the coral-tree pond") are ornamented with false doors treated as niches for beautiful stucco relief scenes from the Buddha's life (mid-14th cent.).

Outside the city were several monasteries of "forest-dwelling" monks (*araññavāsi*). To the west was Wat Sapân Hin ("stone-causeway monastery"), so called because of the stone path leading up to it; it was the seat of the Saṅgharāja (Patriarch) in Râm Kamhèng's time; the remains of a vihara can still be seen there, as well as a colossal stucco Buddha image (several times restored). Also west of the city was Wat Bâ Mamuang ("mango-grove monastery"), founded by King Lö Tai about 1341 and greatly enlarged by his son Lü Tai in 1361 for the Saṅgharāja from the Mòn country, whom he invited to settle there; very little survives of the buildings today. Attached to Wat Bâ Mamuang was the Devālayamahākṣetra, or Hindu temple, built of brick in the form of a mandapa, which contained, in all probability, the magnificent bronze statues of Śiva and Viṣṇu cast by Lü Tai in 1349 (now in Bangkok, Nat. Mus.). South of the city was Wat Jetubana, of uncertain date (probably 14th cent.); the design is unusual, with the walls made of large blocks of schist. Instead

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

of a *cetiya* there was a mandapa (?) containing stucco images of the Buddha in the four *iriyāpatha* (walking, standing, seated, reclining), one on each face of the huge central pier. Also south of the city was Wat Śrībicitrakittikalyārāma, the greater part of which was built by the Queen Mother Tilakaratna in 1403, shortly before Sukhodaya lost its independence for the second time.

North of the city are the remains of a complex of kilns that produced glazed painted stonewares (dishes, bowls, etc.). It is thought they were established by a group of potters imported from Tz'ŭ-chou in China at the end of the 13th century, a little before the group from Lung-ch'üan settled at Śrī Sajjanālaya.

Tonburî (Dhanapurī, Dhon Buri). Situated on the right bank of the Mè Nâm (Jao Pyâ) opposite Bangkok, Tonburî was the capital from the late 1760s to 1782. It is full of beautiful old monasteries, dating from the latter half of the 18th century and the first half of the 19th. Outstanding is Wat Aruṇ, with its huge *prāṅg* incrusted with porcelain and its elaborate mythological figures. Excellent wall paintings are to be seen in several monasteries, including Wat Tòng Suvarṇārāma, Wat Tòng Dharmajāti, and Wat Tuṣitārāma. Others have fine Buddha images brought from Sukhodaya, Biṣṇuloka, and other old cities.

Û Tòng (Uthong). The name Û Tòng ("golden boatyard" or "golden cradle") is historically the Siamese equivalent of Sanskrit Subarṇapurī (see above) and hence more or less interchangeable with it. As a toponym, however, the name Û Tòng applies nowadays to an old site about 17 mi. southwest of the present town of Subarṇapurī. The archaeological importance of the site, to which H. R. H. Damrong Rajanubhab first drew attention in the early 20th century, has proven to be far greater than he could have any means of knowing; but his choice of the name Û Tòng for the site was not entirely happy. He believed it was the city abandoned by "Prince Û Tòng" (Rāmādhipati I) when the latter founded his new capital at Ayudhyā in 1350 (see above); but recent studies show that the place was abandoned in the 11th century and not reoccupied until the 17th.

Chance finds and unauthorized excavations at the site revealed much archaeological material during the middle decades of the 20th century. The first official excavation was conducted in 1936 by H. G. Quaritch Wales. A series of excavations conducted by the Department of Fine Arts from 1958 onward and by J. Boisselier in 1964–66 shows that the site was continuously occupied from prehistoric times to the end of the Dvāravatī period. Discoveries include neolithic artifacts; pottery sherds ranging over a long period of time; prehistoric and protohistoric beads, jewelry, seals, lamps, etc. (some of them attributed by Boisselier to the Funan period on the basis of similarity to material discovered by L. Malleret at Oc Èo); terracotta figurines; small terra-cotta Buddhist reliefs of the 4th–5th centuries; and a wealth of bronzes and other material from the Dvāravatī period. Û Tòng was evidently the site of an important town during the Funan period and of one of the greatest cities of the Dvāravatī period. Boisselier's researches (1965) have shed much new light on Dvāravatī architecture (especially the plans and methods of construction of monuments), provided a better chronology, and revealed a strong artistic influence from Śrīvijaya (specially in the Buddhist bronzes) in the 8th–9th centuries. The site has yielded no relics of the Khmer occupation or of the early Ayudhyā period (the name "Û Tòng" given to the antiquities of the early Ayudhyā period discovered elsewhere is taken from that of the "Prince of Û Tòng," not from the topographical site). In the 17th century the site was resettled, and the ruins of at least one old monument (Site 1) were encased in the basement of a new *cetiya* of the style of Prāsāda Tòng (r. 1630–56).

An excellent collection of antiquities brought to light by the official excavations is exhibited on the ground floor of the Û Tòng National Museum. The second floor contains a collection of antiquities of later date (11th–16th cent.) from the town of Subarṇapurī and other parts of the province.

NOTE: For the transcription of Siamese names there are numerous different systems, but few authors follow any one of them consistently. In this article those which are borrowed directly from Sanskrit or Pali are written in the standard fashion for those languages, while names of Tai origin are given according to the author's phonetic system (see A. B. Griswold, Afterthoughts on the Romanization of Siamese, *J. of the Siam Soc.*, XLVIII/1, 1960; Bowie, 1960, p. 27), with parenthetical variants for place names representing other forms in common use.

THORVALDSEN, BERTEL. Danish sculptor (b. Copenhagen, Nov. 19, 1770, or Nov. 13, 1768; d. Copenhagen, Mar. 24, 1844). The son of a carver of figureheads, Thorvaldsen entered the Royal Academy of Fine Arts in 1781 as a protégé of the painter Nicolai Abraham Abildgaard, a leader of the neoclassic movement, whom he assisted in the decoration of Amalienborg Castle in Copenhagen. Awarded the Rome stipend in 1796, he came under the influence of Asmus Jakob Carstens during his early years there. The first results of his study of antiquities were his *Bacchus and Ariadne* (1799) and *Jason and the Golden Fleece* (1802), both in the Thorvaldsens Museum in Copenhagen, which also houses marble replicas, original models, or casts of most of the works mentioned below. *Jason and the Golden Fleece* manifests that cold precision and reasoned clarity which henceforth characterize Thorvaldsen's style, distinguishing it from Canova's more baroque vivacity (see III, PL. 391; VII, PL. 389).

The patronage of Englishmen helped sustain Thorvaldsen through the succeeding productive years, during which he sculptured the *Cupid and Psyche* (1807), *Venus with the Apple* (1813–16), *Ganymede with the Eagle of Jupiter* (1817), and the celebrated *Shepherd Boy* (1817). Most congenial to his striving for abstract purity and archaistic stylization was relief sculpture (X, PLS. 252, 279), in which he executed some characteristic compositions: *Briseis Being Led Away from Achilles by the Heralds of Agamemnon* (1803), *A Genio Lumen* (1808), and *Priam Supplicating Achilles for Hector's Body* (1815). In 1812, for a visit of Napoleon, he executed a 105-ft.-long relief frieze, *The Triumphant Entry of Alexander the Great into Babylon* (gesso model, Rome, Palazzo del Quirinale; cast, Copenhagen, Thorvaldsens Mus.). When the newly excavated sculptures from the Temple of Aphaia in Aegina passed through Rome on their way to Munich in 1816, Thorvaldsen restored them for the Bavarian king. This close occupation with Greek originals left its mark on Thorvaldsen's work and, unfortunately, on the Greek originals as well.

Meanwhile official recognition had come his way. In 1805 the Royal Academy of Fine Arts in Copenhagen named him professor, and in 1808 he was appointed to the Accademia di S. Luca in Rome. His voyage to Copenhagen in 1819 was a triumph. Kings and emperors vied with one another to give him commissions and bestow high honors on him, and upon his return to Rome in 1820 he had to employ numerous assistants to satisfy the demand for his work. Among the sculptures executed in the following years were the monument of Włodzimierz Potocki (1821) in the Cathedral of Kraków; the Copernicus monument (1823) and the equestrian statue of Prince Józef Poniatowski (1826–27) in Warsaw; the monument of Eugène de Beauharnais, Duke of Leuchtenberg (1827), in the Jesuit Church of St. Michael in Munich and the equestrian statue of Maximilian, Elector of Bavaria (1833–35), in Wittelsbacherplatz, also in Munich; the Byron monument (1829) in the library of

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

Trinity College, Cambridge; the Schiller monument (1835) in Stuttgart; and the funeral monument of Pope Pius VII (1824–31) in St. Peter's in Rome. For the Church of Our Lady in Copenhagen he modeled statues of Christ (1821) and the Twelve Apostles (1821–27; figures of Thaddaeus and Andrew, 1841–42), as well as the baptismal font (1828).

The most celebrated artist of his time, Thorvaldsen was apotheosized by the Danes, who brought him home in 1838 aboard a warship specially sent. The Thorvaldsens Museum was built (1839–48) to house his tomb and enshrine his sculptures. Later generations have dealt harshly with Thorvaldsen; his work has come to be considered lifeless and inexpressive, an adaptation of classical forms to the taste of the cultivated *bourgeoisie*.

TIBET. Since 1951 Tibet has been an autonomous region of the People's Republic of China; its administrative center is the city of Lhasa. The area of Tibetan culture — in which there is notable linguistic and ethnic homogeneity — extends to some districts that even prior to 1951 were nominally part of China and also to some areas which are in the Indus basin and which have been part of India since the 19th century.

SUMMARY. Cultural and artistic development (col. 57). Monumental centers (col. 60): *Western Tibet: Ladakh; Spiti; Kunawar; Ngari; Central Tibet: Ü; Tsang; Eastern Tibet: Amdo; Kham.*

CULTURAL AND ARTISTIC DEVELOPMENT. Tibet (Bod) is located on a plateau north of the Himalaya mountain chain. Its average altitude of about 16,000 ft. discourages agriculture except in the lower regions and on the floors of the larger valleys. The principal product is barley, and the principal occupation of the inhabitants is raising livestock (sheep and yak). The Himalayas act as a barrier against the monsoons and their humidity, and the climate is an arid one. Tibet is battered by strong, sometimes violent winds.

The population, which is small and is concentrated in the more fertile broad valleys, speaks a monosyllabic language belonging to the Sino-Tibetan family. Until a few years ago, Tibetan society had a feudal-theocratic character and was dominated by the lay and monastic aristocracies.

Modern political divisions do not coincide with the linguistic and cultural boundaries of Tibet. This article, therefore, includes not only the central part of Tibet, but also vast zones on the eastern borders that are now part of the Chinese provinces of Chinghai, Szechwan, and Sikang; the modern states of Bhutan and Sikkim, which are Indian protectorates; and various Himalayan zones such as Spiti, Kunawar, and Ladakh that are part of the Indian Union.

Tibet emerged from prehistory at the end of the 6th century when a solid feudal monarchy was established there. For two centuries it was one of the most important forces in Asia, attaining the height of its power under King K'ri sroṅ lde btsan (755–97), who profoundly affected the country's religious and artistic development when, after a dispute between Indian and Chinese monks, he decided in favor of the former, adopting Indian Mahayana Buddhism (see BUDDHISM) as Tibet's state religion.

After the decline of the monarchy (842), the country was broken up into several small states. The monarchic tradition survived primarily in western Tibet, where the kingdom of Guge, which existed until 1630, was the site of a revival of Buddhism in about the year 1000 and of the consequent flourishing of Tibetan art.

The history of central Tibet is instead essentially linked to ecclesiastical developments. From the 11th century on, various Buddhist sects coexisted with and became more powerful than the old lay aristocracy. As a result artistic achievements were centered in the monasteries and temples; the most noteworthy architecture, apart from strictly functional military architecture, was of a sacred nature.

After 1260 the Sakya (Saskya) abbots supported the Chinese Mongols, who conceded to them the temporal rule of central Tibet. But in the following century all tendencies toward unity disappeared, and regions such as Tsang, in which art flourished during the 15th and 16th centuries, asserted themselves.

Within the framework of fragmentary authority divided between Tibetan aristocracy and clergy, there slowly emerged the Yellow sect, or Dge lugs pa, founded by Tsoṅk'a pa (1357–1419). In 1578, the third of this sect's leaders, who are believed to be incarnations of a

Area of expansion of the Tibetan culture. *Key*: (1) Modern political boundaries, (2) Sino-Tibetan boundary prior to 1951.

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

deity, converted the Mongols; a Mongolian prince conferred on him the title of Dalai Lama, a name by which his successors have since been known in China and in Europe. In 1642, a Mongolian chief entrusted the temporal rule of Tibet to the fifth Dalai Lama. In the first half of the following century, after a period of unrest, China established a protectorate over the territory that endured until the fall of the Chinese Empire in 1912. An ill-fated attempt to maintain Tibet's precarious independence ended in 1951 with a treaty that made it part of the Chinese People's Republic.

See also the bibliog. for TIBETAN ART.

MONUMENTAL CENTERS. Tibet consists of three large geographical divisions: western, central, and eastern Tibet. Western Tibet includes the three districts of Ngari, of which the most important artistically is Guge; it also includes the Indian provinces of Spiti, Kunawar, and Ladakh. Central Tibet includes the provinces of Ü (Lhasa is its administrative center and the capital of Tibet), Tsang, K'oṅ po, and Dvags po. Eastern Tibet, whose many subdivisions reflect its uneven topography, includes a large number of districts that can be grouped together into the two large provinces of Amdo in the northeast and Kham in the east. These three geographical divisions have been followed in the list of monumental centers.

Until recently, archaeological excavations have not been permitted in Tibet because of religious bans against provoking the earth spirits. One of the few Western travelers to make a historico-artistic study of Tibet has been the Italian Giuseppe Tucci. The artistic history of the western region of Tibet is fairly well documented but it is incomplete for central Tibet and almost nonexistent for the eastern region. It is not yet possible accurately to define the regional characteristics of Tibetan art, apart from the rather obvious observation that the Indian influence is stronger in the west and that of Chinese art is stronger in the east.

Only those localities of acknowledged artistic interest are included in this article; omitted are monasteries or cities that may be of religious importance but are little-known artistically.

Western Tibet. Ladakh. An independent kingdom until 1841, Ladakh is presently part of India.

BIBLIOG. A. Cunningham, Ladak, London, 1854; A. H. Francke, Antiquities of Indian Tibet, 2 vols., Calcutta, 1914–26; L. Petech, A Study of the Chronicles of Ladakh (Indian Tibet), Calcutta, 1939.

Alchi (Alci). The rNam par snan mdsad monastery, founded by Rin c'en bzaṅ po (958–1055), contains six temples, of which the gSum thsag is decorated with elaborate wood carvings in the Kashmir style and contains a 17th-century picture cycle influenced by the Moghul style (see MOGHUL SCHOOL).

BIBLIOG. A. H. Francke, Antiquities of Indian Tibet, I, Calcutta, 1914, pp. 88–92.

Basgo. This was the capital for a time during the 17th century. Although it is in ruins, the temple dedicated to Byams pa (Maitreya), from the second half of the 16th century, is noteworthy. The ancient royal palace is now the monastery of Seljang.

BIBLIOG. A. H. Francke, Archaeology in Western Tibet, Indian Antiquary, XXXVI, 1907, pp. 87–89; A. H. Francke, Antiquities of Indian Tibet, I, Calcutta, 1914, pp. 86–88.

Lamayura. The monastery, of the 'aBri khung pa sect, is the oldest in Ladakh; the Seṅ ge sgaṅ temple is the most ancient part of the existing complex.

BIBLIOG. A. H. Francke, Antiquities of Indian Tibet, I, Calcutta, 1914, pp. 96–98; J. Schubert, Der tibetische Māhātmya von Lamayury, AAs, VII, 1937, pp. 205–09.

Leh (sLes). The capital of Ladakh, it is dominated by the ancient royal palace on the slope of the rNam rgyal rtse mo hill. This building is a good example of 17th-century civil architecture.

BIBLIOG. A. H. Francke, Antiquities of Indian Tibet, I, Calcutta, 1914, pp. 68–80.

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

Spiti (Spyi-ti). Although this broad, inaccessible valley was first ruled by the kings of Guge and then by those of Ladakh, it succeeded in preserving its autonomy to a great extent.

BIBLIOG. G. Tucci, Indo-Tibetica, III: I templi del Tibet Occidentale ed il loro simbolismo artistico, 1, Spiti e Kunavar, Rome, 1935.

Lhalung (Lha luṅ). A small temple founded by Rin c'en bzaṅ po contains various plaster statues (cycles representing Vairocana, Mañjuśrī as Dharmadhatu Vāgīśvara, and Prajñāpāramitā); these works are closely related stylistically to the sculpture cycle in Tabo.

BIBLIOG. H. L. Shuttleworth, Lha-lun Temple, Spyi-ti, Mem. of the Archaeological Survey of India, XXXIX, Calcutta, 1929; G. Tucci, Indo-Tibetica, III, 1, Rome, 1935, pp. 116–21.

Tabo (Ta p'o). This is the site of the principal monastery of the valley, which also was founded by Rin c'en bzaṅ po. Within its enclosure there are eight temples. The plaster statues in the central temple (a cycle representing Vairocana) are restorations of originals probably of the 11th–12th century. They reflect the influences of both Kashmir art (q.v.) and Pala art (see PALA-SENA SCHOOLS). The frescoes (ca. 1300) are the first and best-known examples of the work of the Guge school, which is essentially of Indian derivation. The frescoes in the gSer k'aṅ (16th cent.) belong to the second period of the Guge school's activity.

BIBLIOG. A. H. Francke, Antiquities of Indian Tibet, I, Calcutta, 1914, pp. 37–43; G. Tucci, Indo-Tibetica, III, 1, Rome, 1935, pp. 21–115.

Kunawar (K'u nu). At one time this region was part of Ladakh; since 1685 it has been a province of what is now the Indian state of Bashahr.

BIBLIOG. A. Gerard, An Account of Koonawur, London, 1841; J. D. Cunningham, Notes on Moorcraft's Travels in Ladakh, and on Gerard's Account of Kunawar, Including a General Description of the Latter District, J. of the Asiatic Soc. of Bengal, XIII, 1, 1844, pp. 172–222, 223–53; G. Tucci, Indo-Tibetica, III: I templi del Tibet Occidentale e il loro simbolismo artistico, 1, Spiti e Kunavar, Rome, 1935.

Chang (Can mk'ar). The small temple at the center of the village contains a cycle of representations of the Na rag (nāraka, or infernal deities).

BIBLIOG. A. H. Francke, Antiquities of Indian Tibet, I, Calcutta, 1914, p. 34; G. Tucci, Indo-Tibetica, III, 1, Rome, 1935, pp. 122–40.

Nako (Na go). The monastery outside the town has been dated back to Rin c'en bzaṅ po. The plaster statues in the central temple (*gTsug lag k'aṅ*) represent the gods of medicine (sMan bla); they have been extensively restored and are much cruder than those of Tabo. The statues in the so-called "Temple of Lotsāva" representing the Pañcatathāgata (the five Buddhas) are older and of better workmanship.

BIBLIOG. A. H. Francke, Antiquities of Indian Tibet, I, Calcutta, 1914, pp. 32–34; G. Tucci, Indo-Tibetica, III, 1, Rome, 1935, pp. 141–74.

Ngari (mṄa' ris skor gsum). An independent kingdom from the 9th century until 1630, it later was part of the Ladakh region and since 1638 has been part of Tibet.

Davazong (Zla ba rdsoṅ). The small temple, which was formerly part of the royal palace, has fine frescoes of the Guge school and gilded bronze statues that are the work of Indian artists.

BIBLIOG. G. Tucci, Santi e briganti nel Tibet ignoto, Milan, 1937, pp. 148–51.

Kojarnath (ąK'or c'ags). The Lotsāva temple contains three gilded silver statues of Mañjuśrī, Avalokiteśvara, and Vajrapāṇi; they are the work of Indian artists. The very finely sculptured wooden portal of the Ducàn (adus k'aṅ) was also executed by Indian artists.

BIBLIOG. G. Tucci, Santi e Briganti nel Tibet ignoto, Milan, 1937, pp. 38–43; G. Tucci, A Hindu Image in the Himalayas, Asia Major, N. S., VII, 1959, pp. 170–75.

Luk. The temple of the abandoned monastery contains fresco paintings (similar to those at Tabo and Nü) of scenes from the life of the Buddha that are closely related to Indian models.

BIBLIOG. G. Tucci, E. Ghersi, Cronaca della missione scientifica Tucci nel Tibet Occidentale (1933), Rome, 1934, pp. 210–19.

Mangnang (Maṅ naṅ). The city is in ruins. A temple contains frescoes of the mature period of the Guge school that depict the legend of the Buddha and terrifying divinities. A chapel in the main temple contains an 11th-century fresco cycle that is the work of Indian masters, perhaps from Kashmir, who were closely connected with the school of Ajanta (q.v.).

BIBLIOG. G. Tucci, ILN, Jan. 28, 1936; G. Tucci, Santi e briganti nel Tibet ignoto, Milan, 1937, pp. 157–63.

Mustang (Klo sman t'aṅ). This center is in Nepalese territory. In the large temple of Tugcèn (T'ugs rje c'en po) and in the temple dedicated to Maitreya, there are frescoes from the 15th or 16th century. Those in the temple of Tugcèn depict the paradise of Akṣobhya, and those in the second represent the mandala of Vajrasattva; they are quite similar to those of the *žiṅ k'ams* in the *sKu abum* (stupa) in Gyantse. Some of the artists were Nepalese.

BIBLIOG. G. Tucci, Tra giungle e pagode, Rome, 1953, pp. 86–88; G. Tucci, Preliminary Report on Two Scientific Expeditions in Nepal, Rome, 1956, pp. 15–16.

Nü. The dGa' ldan p'un ts'ogs temple contains frescoes from the late Guge school (early 17th cent.) that are noteworthy for their landscape details. There are two imposing ruined castles in the town.

BIBLIOG. G. Tucci, E. Ghersi, Cronaca della missione scientifica Tucci nel Tibet Occidentale (1933), Rome, 1934, pp. 191–204.

Piang Dunkar (p'yi dbaṅ Duṅ dkar). Once the site of a populous city, it is now occupied by two small neighboring villages. In the abandoned monastery of Piang there are various wooden, gilded bronze, and plaster statues from the early period of the Guge school. Some are of Indian origin, specifically, of the Pala school (11th–13th cent.). In the temple (Zecàn; rtse k'aṅ) on top of the hill there is an extremely elegant and carefully executed pictorial cycle of the Sixteen Arhats. Large areas of the grottoes around Dunkar, which were formerly occupied by ascetics, are decorated with 15th-century frescoes that are examples of the painting of the Guge school in its most mature period.

BIBLIOG. G. Tucci, Santi e briganti nel Tibet ignoto, Milan, 1937, pp. 170–75.

Ri. In a ruined temple, attributed to Rin c'en bzaṅ po, there are remains of frescoes and plaster statues of the Sarvavid Vairocana cycle. The frescoes in the *mgon k'aṅ* are of a later date and are greatly deteriorated.

BIBLIOG. G. Tucci, E. Ghersi, Cronaca della missione scientifica Tucci nel Tibet Occidentale (1933), Rome, 1934, pp. 359–63.

Shangtze. The monastery temple is a royal sacrarium whose walls are covered with 16th-century frescoes, some of which portray the eight gods of medicine.

BIBLIOG. G. Tucci, E. Ghersi, Cronaca della missione scientifica Tucci nel Tibet Occidentale (1933), Rome, 1934, pp. 248–62.

Tiak (Ti yag). This is the site of a temple founded by Rin c'en bzaṅ po that contains a statue cycle of the most ancient Guge school.

BIBLIOG. G. Tucci, E. Ghersi, Cronaca della missione scientifica Tucci nel Tibet Occidentale (1933), Rome, 1934, pp. 191–204.

Toling (mT'o gliṅ). The plan of the large walled royal monastery of Guge is based on the symbolism of the mandala. The central temple of Ye ses' od has the same form. The temple and its chapels contain a large and complex group of well-preserved frescoes (depicting the Vairocana, Guhyasamāya Tantra, and Saṁvaratantra cycles) that date to the early period of the Guge school, perhaps to the 11th century. Frescoes in another temple depict the ascetic exaltation and penitential mortifications of the Buddha and include realistic representations of wild beasts loosed in burial grounds. In the so-called "Temple of the Sixteen Arhats" there are historical representations of the kings of Tibet and Guge who protected Buddhism; these are extremely interesting as records of ancient customs. The most sacred temple (gSer k'aṅ) has three stories that taper in the form of a truncated pyramid; it was probably based upon the model of the Indian temple at Odantapuri. The cells on each story are decorated with frescoes.

BIBLIOG. G. M. Young, A Journey to Toling and Tsarapang in Western Tibet, J. of the Punjab Historical Soc., VII, 1919, pp. 177–99; G. Tucci,

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

E. Ghersi, Cronaca della missione scientifica Tucci nel Tibet Occidentale (1933), Rome, 1934, pp. 296–329; G. Tucci, Santi e briganti nel Tibet ignoto, Milan, 1937, pp. 164–67; B. R. Chatterji, Tholing Monastery in Western Tibet, J. of the Historical Soc., XIII, 2, 1940, pp. 30–34.

Toshang (do žaṅ). In a temple attributed to Rin c'en bzaṅ po, there are 16th-century frescoes depicting the eight gods of medicine and terrifying divinities.

BIBLIOG. G. Tucci, E. Ghersi, Cronaca della missione scientifica Tucci nel Tibet Occidentale (1933), Rome, 1934, pp. 351–54.

Tsaparang. Formerly the capital of the kingdom of Guge, the city is now deserted and in ruins. Together with nearby Toling, it was the principal center of the Guge school of painting. Drawing inspiration from Indian models, this school first produced the small, almost miniature, paintings of the so-called "White Temple" (lha k'aṅ dkar po) that depict the Vairocana, Mahādevī, and Sarvavid Vairocana cycles. The frescoes of the temple of bDe mc'og in the ruins of the royal palace are of a slightly later date and are noteworthy for their softness of line and skillful composition. In the so-called "Red Temple," the work of the school seems to reflect the decline into which the kingdom of Guge had fallen during the same epoch (16th–17th cent.). A strong tendency toward the monumental took the place of the elegant forms which the members of the school were no longer capable of producing. Other noteworthy painting cycles are that of Vajrabhairava (rDo rje ạjigs byed) in the temple dedicated to that divinity and that of Tārā in the so-called "Temple of the Prefect." Stuccoes were used as integrating elements in the large painting cycles. The heavy bronze baroque images in the "Red Temple" are relatively recent.

Central Tibet. Ü (dBus). In the heart of Tibet, this district was at first the home of the headquarters of the monarchy and later of the Dalai Lamas.

BIBLIOG. A. Ferrari, mK'yen brTse's Guide to the Holy Palaces of Central Tibet, Rome, 1958; G. Tucci, Forme dello spirito asiatico, Milan, Messina, 1940, pp. 191–215.

Chongye (aP'yoṅ rgyas). In the vicinity tumulus tombs of ancient Tibetan kings are still extant.

BIBLIOG. H. Hoffmann, Die Gräber der tibetischen Könige im Distrikt 'P'yons-rgyas, Nachr. der Ak. der Wissenschaften in Göttingen, 1950, pp. 1–15; G. Tucci, The Tombs of the Tibetan Kings, Rome, 1950; G. Tucci, A Lhasa ed oltre, Rome, 1952 (2d ed.), pp. 119–21; H. Richardson, Early Burial Grounds in Tibet and Tibetan Decorative Art of the VIIth and IXth Centuries, CAJ, VIII, 1963, pp. 73–92.

Densatil (gDan sa mt'il). This was the seat of the dynasty founded by Pagmotry that ruled central Tibet in the 14th and 15th centuries. The entrance court of the central temple contains the tombs of these rulers, in the form of large gilded-bronze stupas that were executed by Nepalese artisans. The large central image of the Buddha, which dates from the 14th century, is also by Nepalese artists.

BIBLIOG. G. Tucci, A Lhasa ed oltre, Rome, 1952 (2d ed.), pp. 109–10.

Dranang (Grva naṅ). In the frescoes in the central temple can be seen traces of the Hellenistic and Byzantine trends that arrived through Central Asia (see ASIA, CENTRAL). The statues of Gonkang are lively representations of the terrifying divinities.

BIBLIOG. G. Tucci, A Lhasa ed oltre, Rome, 1952 (2d ed.), pp. 125–26.

Lhasa (lHa sa, "land of the gods"; originally Ra Sa, land "enclosed by walls" or "by buildings"). This has been the capital of Tibet since the 7th century. It has been repeatedly subjected to war and sacking, and is more important politically than artistically. The large Potala Palace, which dominates the city, is of characteristic architectural style and was built in the 17th century, partly on the foundations of the ancient royal palace. Until recently Potala Palace was the residence of the Dalai Lama. In the city, the most important sanctuary is the Jo k'aṅ (aP'rul snaṅ), which contains the Jobo, an image of the Buddha that, according to legend, dates from the 7th century; the statue probably was reworked in the 13th and 17th centuries. Some wooden pillars by Nepalese artists are among the few ancient remains in this temple. The same is true of the Ramoche temple, founded in the 7th century. The large monasteries in the vicinity, Sera (Se ra), Drepung (aBras spuṅs), and Ganden (dGa'ldan), have great religious importance but are of little artistic interest.

BIBLIOG. L. A. Waddell, Description of Lhasa Cathedral, J. of the Asiatic Soc. of Bengal, LXIV, 1895, I, pp. 259–83; L. A. Waddell, Lhasa and its Mysteries, London, 1904; S. C. Das, The Monasteries of Tibet, J. and Proc. of the Asiatic Soc. of Bengal, N. S., L, 1905, pp. 108–16; F. S. Chapman, Lhasa the Holy City, London, 1938; A. C. Walsh, Lhasa, JRAS, 1946, pp. 23–31; G. Tucci, A Lhasa ed oltre, Rome, 1952 (2d ed.), pp. 74–87.

Netang (sNe t'aṅ). This is the site, south of Lhasa, where the Indian scholar Atīśa died in 1054. In the temples, which have been rebuilt and destroyed several times, there are some statues of Indian origin.

BIBLIOG. G. Tucci, A Lhasa ed oltre, Rome, 1952 (2d ed.), pp. 61–62.

Samye (bSam yas). There is a royal temple of the Tibetan monarchy, whose construction was commissioned by King K'ri sroṅ lde btsan. The five-storied central temple is surrounded by four major and eight minor chapels that symbolize the major and minor continents of Indian cosmology. The temple has suffered fire damage several times and contains no noteworthy frescoes or ancient sculptures.

BIBLIOG. G. Tucci, A Lhasa ed oltre, Rome, 1952 (2d ed.), pp. 103–5; G. Tucci, The Symbolism of the Temple of bSam-yas, East and West, VI, 1955–56, pp. 279–81; G. Tucci, Minor Buddhist Texts, II, Rome, 1958, pp. 26–28; R. A. Stein, Une chronique ancienne de bSam yas: sBa-bzed, Paris, 1961.

Tsetang (rTse t'aṅ). It is situated at the entrance to the Yarlung (Yar kluṅs) Valley, which was the cradle of the Tibetan monarchy. The Ngacho (lNa c'os) temple contains noteworthy statues and bronze stupas of Nepalese workmanship.

BIBLIOG. G. Tucci, A Lhasa ed oltre, Rome, 1952 (2d ed.), pp. 115–16.

Yerpa (Yer pa). A complex of rock-cut hermitages is located here; these are noteworthy primarily for some statues contemporary with Atīśa (11th cent.) that were perhaps executed by Indian artists among his followers.

BIBLIOG. G. Tucci, A Lhasa ed oltre, Rome, 1952 (2d ed.), pp. 92–95.

Tsang (gTsaṅ). The political conflict that has always existed between this region and Ü has influenced Tibetan history almost up to the present.

BIBLIOG. G. Tucci, Indo-Tibetica, IV; Gyantse ed i suoi Monasteri, 3 vols., Rome, 1941.

Gyang (rGyaṅ). In the vicinity of Lhatse is the large *sKu ạbum* of Gyang, which was built in the last decades of the 14th century (that is, after Shalu and before Gyantse). Although it is in a poor state of conservation, it is one of the most important monuments of Tibetan art. The painting cycles are by local artists who followed various trends (Central Asian, Nepalese, and, to a lesser extent, Chinese).

BIBLIOG. G. Tucci, Tibetan Painted Scrolls, Rome, 1949, pp. 179–85.

Gyantse (rGyal rtse). The city is the commercial center of the Tsang district. Its large monastery complex (dPal ạk'or c'os sde) was begun in 1427, suffered war damage in 1904, and was later restored. It includes one of the major monuments of Tibetan art — the central temple and, even more important, the large *sKu ạbum*. The domed, four-storied stupa contains a total of 73 chapels and an almost complete pictorial representation of Mahāyāna doctrines; these representations culminate in the statue of Vajradhara (rDo rje ạc'aṅ) in the highest cell. The frescoes reflect the Khotanese style (see KHOTANESE ART).

BIBLIOG. S. C. Vidyabhusana, On Certain Tibetan Scrolls and Images Brought from Gyantse, Mem. of the Asiatic Soc. of Bengal, I, 1, 1905, pp. 1–23; G. Tucci, Indo-Tibetica, IV, 1, Rome, 1935, pp. 146–300.

Iwang (gYe dmar). A little-used small temple contains a series of statues in the Central Asian style representing the cycle of the Seven Buddhas. The walls of the central chapel are decorated with frescoes depicting the cycle of the prayers for the purification of sins (ltuṅ bšags). The paintings are poorly designed and composed but contain fine effects of color; they were executed in an Indian style that was strongly influenced by the Chinese and Central Asian manner. The statues and frescoes in the chapel to the right of the central one are clearly of Central Asian derivation.

BIBLIOG. G. Tucci, Indo-Tibetica, IV, 1, Rome, 1941, pp. 134–40; G. Tucci, A Lhasa ed oltre, Rome, 1952 (2d ed.), pp. 32–34.

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

Jonang (Jo naṅ). The headquarters of the historian Tāranātha (17th cent.) and the mother house of the Jo naṅ pa sect are located here. The large *sKu ạbum* contains ancient paintings of the Nepalese school, others similar to those in Gyang, and still others that are the result of a restoration by Tāranātha in 1621. Central Asian influences are dominant in the upper stories of the *sKu ạbum*.

BIBLIOG. G. Tucci, Tibetan Painted Scrolls, Rome, 1949, pp. 190–96.

Lhatse Dyong (Lha rtse). The sanctuary has been modernized, but a rock-cut chapel contains sculptures and also a wooden door that is certainly the work of Indian artists and is not later than the 13th century.

BIBLIOG. G. Tucci, Tibetan Painted Scrolls, Rome, 1949, pp. 204–05.

Narthang (sNart t'aṅ). The monastery located here is the headquarters of a famous printing shop and contains a two-storied *sKu ạbum*, which is of no architectural interest but is richly decorated with 15th-century frescoes that show a well-assimilated and pure Chinese influence; these are similar to the almost contemporaneous frescoes at Gyantse.

BIBLIOG. G. Tucci, Tibetan Painted Scrolls, Rome, 1949, pp. 186–89.

Nesar (gNas gsar). This is the site of a very ancient temple, in almost total ruin. The large gilded statues in the rta mgrin lha k'aṅ are very similar to those in Iwang and are probably the work of the same artists.

BIBLIOG. G. Tucci, Tibetan Painted Scrolls, Rome, 1949, p. 201.

Pindzoling (Pun ts'ogs gliṅ). The monastery located here was dependent on that of Jonang and derives its art from the same source. The paintings are distinguished for the precision of their design, which predominates over the color. The frescoes of the cycle of Raktayamāri (gŠed dmar) in the *mGon k'aṅ p'ar* are noteworthy. Their airiness, mobility, and luminosity are almost unique in Tibet. The mK'a' spyod temple contains a cycle of paintings executed between 1631 and 1639 that marks a rebirth of the Indian traditions. Nearby, the paintings (ca. 1617–18) in the rJe btsun Tāranātha p'o braṅ show the influences of the schools of central and southern India.

BIBLIOG. G. Tucci, Tibetan Painted Scrolls, Rome, 1949, pp. 196–201.

Pokang (sPos k'aṅ). The monastery founded on this site in 1213 is largely modern in its present structure, but it contains a portrait of Atīśa that dates from the beginning of the 16th century and a statue of Maitreya that originated in southern India. The meeting room (*ts'ogs k'aṅ*) is the oldest part of the monastery; its frescoes are partly in the Nepalese style and partly the work of a delicate painter who signed himself dGe legs bšes gñen and whose art clearly shows Chinese influences.

BIBLIOG. G. Tucci, Tibetan Painted Scrolls, Rome, 1949, pp. 201–04.

Potong (Po toṅ). The two temples of the monastery situated here are damaged, but there remain fragments of frescoes that are similar and in some instances superior to those of Gyantse.

BIBLIOG. G. Tucci, Tibetan Painted Scrolls, Rome, 1949, p. 205.

Ralung (Rva luṅ). At an altitude of about 14,800 ft., this is the site of a large monastery. The imposing central temple, the Tsuglakang (*gtsug lag k'aṅ*), contains large statues of Tsepame (Ts'e dpag med; Amitāyus) and Champa (ạ Byams pa; Maitreya), among others; there is also a series of paintings of the masters of the Bka brgyud pa sect. The older part, the *mgon k'aṅ*, contains deteriorated frescoes. The *sKu ạbum*, which is similar to that in Gyantse, contains later frescoes (18th cent.).

BIBLIOG. G. Tucci, A Lhasa ed oltre, Rome, 1952 (2d ed.), pp. 47–48, 53–56.

Sakya (Sa skya). This is the site of the principal monastery of the Sa skya pa sect, whose abbots were the temporal rulers of Tibet in the 13th and 14th centuries and who maintained a form of independence until 1951. Founded in 1073, the monastery was almost completely rebuilt in the 16th century. It is made up of somewhat dissimilar groups of buildings containing rich collections of art objects, mainly Indian in origin. The best example is the gilded-bronze statue of Mañjuśrī, of Kashmirian workmanship, that is in the dBu rtse gsar ma temple. There are also some Pala bronzes and various objects of Nepalese origin. The Blo blaṅs temple has a magnificent door of carved wood. The ancient frescoes have been completely destroyed in the numerous wars fought around the rich monastery.

BIBLIOG. S. C. Das, A Journey to Lhasa and Central Tibet, London, 1902, pp. 312–16; G. Tucci, Un principato indipendente nel cuore del Tibet: Sachia, Asiatica, VI, 1940, pp. 353–60; G. Tucci, Tibetan Painted Scrolls, Rome, 1949, pp. 172–76.

Samada. In the vicinity there are two important temples. The rKyaṅ p'u temple is very old and dates from the time of the monarchy or, more probably, from the 11th century; its present form is a 14th-century reconstruction. However, the entrance court and the chapel on the first story contain paintings in the Indian style, dating perhaps from the 11th century, that are similar to those of Mangnang. The temple of Dregun (ạbras k'ud) contains a cycle of paintings of Gur mgon, of a terrifying and demonic nature. The frescoes are based on Central Asian models of Chinese inspiration. The statues in both temples are also in Central Asian style.

BIBLIOG. G. Tucci, Indo-Tibetica, IV, 1, Rome, 1941, pp. 93–132.

Shalu (Žva lu). Constructed through the initiative of the great writer Bu-ston (1290–1364), the monastery has remained practically intact. The architecture is clearly of Chinese derivation. The central temple (gSer k'aṅ) is decorated with frescoes depicting the hundred moments in the life of the Buddha. In these frescoes the Chinese influence is in large part outweighed by Indian, specifically Nepalese, influences.

BIBLIOG. G. Tucci, Tibetan Painted Scrolls, Rome, 1949, pp. 177–78.

Shigatse (gŽis ka rtse). The capital of the Tsang region, the city contains nothing of interest except the large fort, which was rebuilt in the 18th century on the ruins of the palace of the ancient kings. Nearby is Tashilumpo, headquarters of the Tashi or Panchen Lama, one of the two great dignitaries of the Yellow sect that is predominant in Tibet (the other is the Dalai Lama). The monastery, founded in 1447, is of no great artistic interest; the most important temple and the chapels built over the tombs of Panchen Lamas are extremely rich in gold and precious stones.

BIBLIOG. S. Hedin, Transhimalaya, I, Leipzig, 1909, pp. 263–349; G. Tucci, A Lhasa ed oltre, Rome, 1952 (2d ed.), pp. 131–33.

Eastern Tibet. Almost no historico-artistic information is available for this vast region. The existing temples seem to be mainly of recent construction (16th–18th cent.). Some of the oldest were completely destroyed in various wars during the present century and were then completely or partially reconstructed, as were Litang (Li t'aṅ), founded about 1100; Chamdo (C'ab mdo), founded in 1437; and Choni, which until its destruction in 1928 was the seat of an independent principality.

BIBLIOG. P. K. Kozlov, Mongolija i Amdo i mertvyj gorod Hara-Hoto. Ekspedicija Russkogo Geograficeskaja Obscestva v nagornoi Azii 1907–09 [Mongolia, Amdo and the dead city of Qara-qoto. The expedition to further Asia of the Russian Geographical Society in 1907–09], Petrograd, 1923.

Amdo (*A mdo*). Huangchung. A huge monastery founded in 1537 on the borders of the Tibetan linguistic territory in the Chinese province of Chinghai (Ch'ing-hai) rises here on the site of the birthplace of Tsoṅ k'a pa.

TIBETAN ART. Tibetan art is largely derived from two major currents — Indian art (q.v.) and Chinese art (q.v.). It accepted and freely elaborated the elements of both, and although its sources of inspiration are clearly evident, Tibetan art has retained a marked individuality. Like Nepal (see NEPALESE ART), Tibet preserved and further developed such Indian artistic traditions as those of Kashmir art and the Pala-Sena schools (qq.v.) after these had become weakened or had disappeared in their places of origin.

SUMMARY. Religious and historical background (col. 67). Prehistory and protohistory (col. 68). Architecture (col. 69). Painting (col. 73). Sculpture (col. 77). Minor arts and handicrafts (col. 80).

RELIGIOUS AND HISTORICAL BACKGROUND. Tibetan artistic expression is inspired solely by religion; art serves cult as a means of bringing man into contact with the divinities. Thus, in order to understand Tibet's art, it is necessary to consider briefly Tibet's religion. The religious history of Tibet is usually divided into two main currents: one that centered in the autochthonous religion called Bon, which existed prior to the advent of Buddhism; and the other that developed around Buddhism, which in its Tibetan form is generally called Lamaism, from the word *bla ma* (supreme one); this appellation is incorrect in that, though Tibetan Buddhism is of a monastic nature, not all of the monks (*grva pa*) are *bla ma*. Bon (whose followers are called *Bon po*) is fundamentally a shamanistic religion but has infinite local varieties that at some undetermined time assumed a systematic form; its official form should be distinguished from its popular form, which has infinite nuances and varieties. Bon survives in many areas of Tibet but has been strongly influenced by Buddhism, to the point that many of its doctrines are difficult to distinguish from some of those of the schools of Tibetan Buddhism (such as the rÑiṇ ma pa school). In addition to Bon and Buddhism there exists *mi c'os*, the religion of the people, which is both a survival of the most ancient beliefs (celebrated in magical, apotropaic, and seasonal rites) and a compromise with Buddhism. In its expansion, Buddhism, rather than set itself against such an ancient and deeply rooted religious tradition, embraced it and imposed on it the stamp of legitimacy.

Buddhism (q.v.) first appeared in Tibet during the early period of the monarchy, but it did not become firmly established (after conflicts and reversals) until the time of King K'ri sroṇ lde btsan (742–97), when the temple of bSam yas was built and the monastic order was founded. This is called the period of the first introduction (*sṅa dar*) to distinguish it from the period of the second introduction (*p'yi dar*), which began at the time of Atīśa, who was sent by the kings of western Tibet to spread Buddhist doctrine throughout central Tibet and who died at Netang in 1054. The second introduction occurred after Buddhism had been persecuted and declined under King gLaṅ dar ma. The revival was centered in western Tibet and was attributable not only to Atīśa but also to Rin c'en bzaṅ po (958–1055), founder of the temple of Toling. In Kham in eastern Tibet also, the Buddhist religion was revived in some centers. It slowly began to flourish again as the number of Indian missionaries to Tibet increased and as social and political conditions gradually made Buddhism unsafe on the Indian subcontinent. The *lotsāva* (translators) contributed to this revival when they undertook the immense task of translating the works that were to be contained in two large collections, the *bKa'ạgyur*, which contains the revelation attributed to the Buddha, and the *bsTan ạgyur*, which includes Buddhist doctrinal works and commentaries, as well as poetic, scientific, and prose works that introduced many diverse aspects of Indian thought into Tibet.

The revival had reached its peak by the 13th century, when such large monasteries as as Sakya Ts'al, Reting, Drigunpa, and Densatil had become important centers of political power as well as of religious influence, since they sought to maintain relations with India and Nepal. The history of Tibet centered in these monasteries and their rivalries until the advent of the 5th Dalai Lama in the 17th century. In the monasteries arose particular predilections for diverse schools of thought and mystical experience that had come to Tibet from India; each of these schools proclaimed itself to be directly derived from the Indian masters by means of a well-defined spiritual succession and in an uninterrupted continuity. With few exceptions the doctrine remained basically the same, but different trends gave varying emphasis to particular points of dogma and liturgy. The most important of these trends were rÑiṅ ma pa, the oldest, related to the literature and doctrines introduced into Tibet at the time of the kings; Sa skya pa (from the name of the monastery), also known as the lam ạbras school (with its subsect of Ṅor pa); Bka brgyud pa, which gives great importance to the doctrines of Hathayoga and whose best-known representatives were Marpa and the poet-mystic Milaraspa; and Dge lugs pa, the reformed sect, usually called the Yellow sect, from the cap that distinguishes its members. This sect, founded by Tsoṅ k'a pa (1357–1419), emphasizes a very strict monastic life and places great stress on logic. The Tantric cycles that predominate in these schools, their *yi dam* (patron divinities), their *c'os skyoṅ* (protecting deities), and their most illustrious masters are the subjects most often treated in Tibetan painting and sculpture.

PREHISTORY AND PROTOHISTORY. Very little is known about Tibetan prehistory and protohistory. The only evidence of early civilization seems to be some megalithic monuments, which cannot, however, be dated with absolute certainty. Some, such as those at Doptra (rDo k'ra), no longer have sacred significance, while others, such as those at Po, still preserve their religious character. Po, though outside the political boundaries of Tibet (in Bashahr State), has a Tibetan culture. Every year it is (or was) the custom of the village people to gather in a sacred area delimited by a circle of stones. At the center of this circle are two monoliths, one taller than the other. The taller one symbolizes the *axis mundi* and, therefore, the ritual ascent. Chants sung during the ritual dances reflect this symbolism and reveal pre-Buddhist origins. Circular areas delimited by stones are found in many parts of Tibet (there is a noteworthy example atop a mountain near Sab dge ldiṅ) and are surely of a sacred or funerary nature.

The existence of some caves has been noted in western Tibet (Tucci and Ghersi, 1934). The most important of these are near Luk and look down on the river. They are isolated caves that are not related to troglodytic cities such as those located at Tsaparang and Mustang on the Nepal border. Given their location, they could be prehistoric; but this will remain only a hypothesis until scientific research can demonstrate their age. No more precise chronology can be deduced from the tombs discovered by P. Aufschnaiter (1956–57) near Lhasa.

Among the doubtful evidence of the prehistoric and protohistoric periods are some objects, generally of bronze, sometimes of copper, that have been unearthed in great numbers during cultivation of the fields. The Tibetans call them "little stones dropped from the sky" (*t'og rdeu*), and they are analogous to the "lightning stones" found in the West. They bear representations of the K'yuṅ (Garuḍa), a mythical bird, symbol of celestial powers; crosses (such as those studied by Janse, 1932); animals (monkeys, horses); rings and circles with various decorations; and animal fights, evidently inspired by steppe art (see STEPPE CULTURES). Some of these objects clearly were inspired by Tibetan religious traditions and are, therefore, indigenous. Others may have been imported or are imitations of foreign themes. Some of the circular ornaments formed of stylized figures are similar, as Goldman (1961) has demonstrated, to some Luristan bronzes. This similarity is in no way surprising; Tibet had commercial ties with the rest of the world,

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

and nomadic migrations of various origins may have come through the mountains since early times.

Also noteworthy are the *gzi* (beads) often found in Tibet. Of a whitish vitreous paste with striations and small circles in black and dark brown, they are much sought after for their supposed protective powers. They are unearthed in the fields and are surely of Western origin.

ARCHITECTURE. The earliest information about Tibet comes from the Chinese, who refer to the rise of the dynasty that, having unified the country, soon afterward became a power with which China herself had to reckon. The Chinese chronicles report that the Tibetans led a pastoral life and had no fixed habitations. Yet some sites were encircled by walls, and, of the houses that existed, some had flat roofs while others reached a height of several meters. Members of the aristocracy lived in large felt tents (Pelliot, 1961, p. 2).

Tibet's rapid expansion and the clashes and encounters with those cultures bordering on its new empire soon changed native customs. The nomadic chiefs began to use fortresses (*mk'ar*) as temporary residences. There are no extant remains of a castle that can with certainty be attributed to the ancient epoch, although Bon po tradition affirms that each king had his own castle. Some buildings that have a special sacred character, though destroyed and reconstructed many times, probably retain the ancient plan. An example is the Yumbukalang in Yarlung, which tradition says was the palace of the king Lha t'o t'o ri. In Chongye, probable site of the palace of Sroṅ btsan sgam po, there are extensive ruins, but they are undoubtedly the remains of more recent fortifications. The Yumbukalang is a bold construction with a high tower and stands on the rocky spur of a mountain overlooking a river. The influence of Chinese military architecture is evident in this building.

Nevertheless, because the Tibetans were warriors and hunters they continued for a long period of time to use tents as their habitual residences. The Bon po called their temples *gSas k'aṅ*; their shape is not known. In western Tibet a circular building at Kyun lung is indicated by some as a Bon po temple; however, its relation to the founder of systematic Bon, claimed by local tradition, is doubtful. Any enclosed space intended for ritual purposes can be called *gSas k'aṅ*, or *lha k'aṅ*. The ritual areas with megaliths encircled by stones, mentioned above, may be of this type and perhaps also served as places of burial or laying-out. The tombs of the Tibetan kings are to be attributed to this early period. These tumuli, of various proportions, contained a funerary chamber, whose arrangement or form is discussed in literary sources which were compiled at a later date but which were certainly drawn from ancient texts, such as the *bKa' t'an sde lṅa*. The only visible part of these tombs (still standing in some of them) is the pillar that surmounts the tumulus. Sometimes, but not always, this pillar bears a carved funerary inscription and is crowned by a tiny roof with raised corners in the Chinese fashion. At the center of the roof there is a spherical or semispherical stone, and the base of the roof may be covered with Chinese-inspired designs that are symbols of water. Their similarity to Chinese funerary steles is evident. There is no doubt that these pillars (*rdo riṅ*) not only served for the funerary inscription of the dead king but also had a complex religious significance (as center, *axis mundi*, mountain, mountain-ancestor). Unfortunately, as Tibetan historical tradition testifies, these tombs were repeatedly desecrated. The castle of Leh, constructed by King Seṅ ge rnam rgyal (1580–ca. 1640), is one of the most important works of Tibetan architecture. It is both palace and fortress and contains many temples whose walls are covered with paintings. It is nine stories high and dominates the hill on which it stands. In this work Tibetan architects demonstrated a remarkable ability to use the rolling nature of the land to good advantage. Walls and counterforts run along the rock, rising to the site of the palace they protect.

The Potala Palace (PL. 52), begun by the 5th Dalai Lama in 1643 on the site of ancient constructions (some of which can be seen on the interior of the palace and seem to date back to the time of Sroṅ btsan sgam po), was finished at a later date, in the time of the regent Saṅs rgyas rgya mts'o. The grandeur of the nine-story building is enhanced by its position on the dMar po ri (Red Hill), from which it dominates the city of Lhasa and the entire valley as far as the lCags po ri (Iron Hill; PL. 53), with its large medical college. These large buildings were built in sun-baked bricks that were smoothed and then whitewashed. The structures almost always rest on stone walls.

The native tradition, strengthened through its contacts with Chinese architecture, gradually became more refined as the construction of religious buildings gave a major stimulus to building activity. Such constructions were, according to Tibetan religious beliefs, a source of great merit for the person who commissioned them and for those who worked on them; the *corvée* exacted by the heads of convents and by the state became tolerable in this guise since it entailed a spiritual reward that would assure a better destiny in future lives.

Tradition assigns the earliest Buddhist temples to the time of Sroṅ btsan sgam po and maintains that the aP'rul snaṅ gi

Tucci, E. Ghersi, 1934*).

gtsun lag k'aṅ and the Ramoche temple of Lhasa were founded by the king's two wives, who were Nepalese and Chinese. It is highly probable that these two temples have undergone many successive renovations and reconstructions. The same is also true of the temple of bSam yas, which was erected by King K'ri sroṅ lde btsan (755–97) after he had proclaimed Buddhism the state religion. The bSam yas temple was destroyed by fire many times, but ancient texts and the description of its plan indicate that the surviving temple, which, in the mind of its creator and consecrator, must have been conceived as a magical projection of the Buddhist world, has preserved the original design. Though the plans of all the temples are based on mandalas (psychocosmograms), this is especially evident, and is clearly noted by ancient sources, in bSam yas. This temple followed the model of the Indian temple of Odantapuri, which had a great influence on Tibetan sacred architecture. It was used as the model also for the temple at Toling; the Jo k'aṅ in Lhasa probably reproduces a temple in Vikramasila. The temple of bSam yas represents the world with its four principal and four secondary continents (*gliṅ*). This construction symbolized the magical substitution of the new world established by Buddhism for the old world dominated by Bon and therefore assured its royal builder, the Lord of the Law (c'os rgyal ba), and his family of the establishment of a new order.

It is known that many *lha k'aṅ* (places of worship) and *gtsug lag k'aṅ* (monastery schools) were instituted in western Tibet by Rin c'en bzaṅ po, who was sent by the king of Guge to Kashmir to learn the Buddhist Law, to master Sanskrit, and to introduce Buddhist art and thought into that region. Many of these temples and religious complexes are still almost intact. Some, such as that at Mangnang, are decorated with frescoes of the period. The plan of these buildings is almost always the same, although the proportions are different. There is a pronaos, supported by piers or wooden columns, from which

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

a door (sometimes three doors, symbolizing the three accesses to liberation) leads to the temple proper, which is rectangular in shape. Along the back wall is the altar, or a cella that contains the altar (FIG. 71 center and right). On the altar is a representation of the divinity (*gtso bo*) to whom the temple is dedicated. Often the cella is surrounded by a narrow ambulatory (*skor lam*). In the larger temples the *skor lam* is the continuation of the two side aisles into which the temple is divided by a double series of piers or columns that support the ceiling. The center of the roof is open to admit light.

Though the *lha k'aṅ* is rectangular rather than square, it reflects the symbolism that marked the temples of India; for this reason it is considered a *t'ugs rten*, the Receptacle of the Spiritual Plane of the Buddha. The *gsuṅ rten* is the Receptacle of the Word, that is, the repository of the books containing the revelations of the Buddha, and the *sku rten* is the Receptacle of the Physical Plane. The *mc'od rten*, the Tibetan adaptation of the Indian stupa, is also considered a *t'ugs rten*. The monastic complexes extend around the large temples, surrounding them with constructions built one against the other; these constructions house various colleges (*grva ts'aṅ*). Generally the *lha k'aṅ* dominates the mass of buildings and is easily recognized by its size and its gilded roof. In large monasteries the *lha k'aṅ* — or one of them, if there are several — serves as a meeting place to which the monks are called for the many religious functions, and in this case it is called *ạdus k'aṅ* (or *ts'ogs k'aṅ*; "meeting place"). Especially in the large monastic complexes, the *ts'ogs k'aṅ* is an imposing building; it has a large central opening (*bsil yaṅ*) in the roof that serves to admit light. Pillars (*ka ba*) with capitals made up of a square element (*bre*), a small curved element (*gžu t'uṅ*), and a larger curved element (*gžu riṅ*; PL. 54, below) support the beams (*gduṅ ma*). The images are arranged along the back wall. During the ceremonies the monks read the sacred books and recite the office while seated on rows of cushions arranged below the opening in the roof. At the corners of the temple roof (*k'yams*) are the *t'ug*, wooden frameworks that are covered with cloth and yak hair and are surmounted by a skull and trisula (PL. 53, below). The *t'ug* serves as a dwelling place for the tutelary demons, which usually vary from sect to sect. Also on the roof are the small square bases that hold the *dar c'en*, flags that are believed to have protective powers, and a symbolic wheel between two gazelles (cf. PL. 43, left).

The roof often overhangs the topmost part (*dbu rtse*) of the temple, reproducing the Chinese pagoda model; such a roof is known as *rgya p'ibs*, or *rgya p'ubs*. At the center of the central rib of the roof, which is almost always gilded, are ornamental turrets or spires (PL. 53, below).

Many statues are so large that they must be placed in special temples, which are built in several stories so that the pilgrim may have a complete view of the image in its various parts.

Among the other noteworthy buildings that either stand alone or are included as freestanding elements in the larger complexes are the *maṇi k'aṅ*, with their prayer wheels; these are large cylinders that contain paper scrolls on which the formula "Oṃ maṇi padme hūm" is written hundreds of thousands of times (cf. BUDDHISM, col. 695). The formula invokes the divinity sPyan ras gzigs (Avalokiteśvara), protector of Tibet, and is recited by Tibetans every day. It is also inserted into more modest metal prayer wheels. The cylinders contained in the *maṇi k'aṅ* are often several yards high; they turn easily on iron or wooden pivots at their center. A chain or cord attached to the base of the cylinder sets the machine in motion when it is pulled.

The *mc'od rten* is derived from the Indian stupa; because it was introduced into Tibet at the time when Mahayana Buddhism was fostering new ideas and new architectural concepts in India, it assumed forms different from those which prevailed during the most ancient period of Buddhism. There are eight principal types of *mc'od rten*; following the Indian tradition, these correspond to the different places at which the Buddha performed his twelve memorable works, as reflected in the picture cycles (*mdsad pa bcu gñis*; from birth to death). The *mc'od rten* in the form of a stairway is related to the city of Sankasya, to which the Buddha descended after having ascended to heaven to preach the Law to his mother. Another type is called *sgo maṅ* ("of the many doors") and has many niches that sometimes took the form of true chapels. Among the most important examples of this type is that of rGyaṅs ạBum mo c'e, founded by bSod nams bkra šis (1352–1417), and those of K'ro p'u, of Gyantse (FIG. 71), and of Byams pa gliṅ, founded in 1472. All of them have a succession of stories leading to the cella on top. The pilgrim progresses from one story to another according to the ritual route, passing through chapels richly decorated with mural paintings in which images are used to represent the various phases of the mystical experience, from the most limited to the supreme. The *sgo maṅ* type of *mc'od rten*, with interior chapels of the type described, is generally called *sKu ạbum* (of the hundred thousand images).

These buildings are believed to gain great merit for those who commission them. Sometimes the donor uses the length of his own arm as a unit of measurement in order to identify himself ideally with the construction. The *mc'od rten* do not always rise near monasteries but are often found at the sides of roads, on the roads themselves, or at the ends or the center of bridges. They often have the appearance of large domed portals; the interior of the vault is usually covered with cycles of paintings representing the divinity to whom the construction is dedicated.

A *mc'od rten* that contains relics of a person considered particularly holy is called *gduṅ rteṅ* and is usually built inside a temple. The *gduṅ rteṅ* is made of metal, usually bronze, and sometimes even of precious metals adorned with precious or semiprecious stones (e.g., the *gduṅ rteṅ* that contains the re-

Tibetan architecture. *Left*: Gyantse, sKu ạbum (*a*) image of Vajradhara; (b) bell; (c) cupola; (d–g) stepped terraces (*from G. Tucci, Indo-Tibetica, IV, 1, 1941*). *Center and right*: Tibetan temple, section and plan: (*a*) peristyle; (*b*) terrace roof; (*c*) gallery; (*d*) aisles; (*e*) central aisle; (*f*) library; (*g*) sanctuary; (*h*) pagoda; (*i*) statues (from *RAA, IV, 2, 1927*).

mains of the Panchen Lamas in Tashilumpo and that which holds the remains of the Dalai Lamas in the Potala Palace). Sometimes the *gduṅ rteṅ* contains books or written formulas (*gzuṅs*) that express in a series of phonemes the essence of a particular teaching or summaries of especially important texts, such as the Prajñāpāramitā in one verse. More often it contains *ts'a ts'a*, molds of clay mixed with the ashes of saintly lamas or fragments of books. On these *ts'a ts'a* are stamped some of the above-mentioned formulas as well as images of divinities or representations of famous stupas of both Tibet and India (IV, PL. 205). The more ancient *ts'a ts'a* were made with stamps imported from India, as can be inferred from the Indian characters on them.

PAINTING. Tibetan art achieves noteworthy results in painting (ri mo) on walls as well as on canvas, silk, and wood. In Tibetan painting the conception must be distinguished from the execution. The inspiration is firmly founded in religious experience; unless he is dealing with representations of the Buddha, the bodhisattvas, and the Masters (for which there are helpful rules of iconography), the painter depicting the great tantric cycles must follow very complicated liturgical schemes that are described by these cycles. The artist, therefore, must have a knowledge of tantric literature and doctrine or he must let himself be guided by an expert. In the latter case, a lama outlines the compositional scheme (*bkod*) of the cycle to be depicted, designating the proper places for the various images or their symbols. The tantric masters must know how to draw the mandala that is part of the various rites to which only the initiates and those being initiated are admitted; the mandala is traced with colored powder on the ground inside a special temple (*dbaṅ skur lha k'aṅ*, as at Toling). When the rite is ended, the mandala is rubbed out. When the mandala is painted on the walls of temples, the lama and the artist cooperate closely, the former supplying the suggestions and outlines and the latter executing the painting. In some cases, however, both functions are carried out by the same person, especially in large monasteries, where there are always some lamas who are also artists.

Paintings on canvas or silk (tankas; *sku t'aṅ* or *t'aṅ sku*) are generally hung in temples but may also be rolled up and can be carried on journeys as protection against possible dangers. The material, usually rectangular in shape (in older paintings it is almost square), is carefully soaked in a lime solution and then treated by rubbing it with a smooth object (such as a shell). After this preparation, the outline of the figure is drawn on it; then the colors are added to the drawing. A cloth frame is sewed around the painting. In ancient times these frames were of cotton and later were made of precious Chinese damask. Finally, a fine silk flap is sewed on the top part of the frame to protect the painting (PLS. 35–42, 44, 46, 47; II, PLS. 385–387; XIII, PLS. 461–463).

Temple walls are usually covered with paintings (PL. 43). In their execution, a rather thick plaster, generally a mixture of earth and finely chopped straw, is spread on the wall. On this background, well-smoothed so as to remove all porousness, the design is outlined as for the tanka and then the colors are applied. An oily substance that gives the painting greater sheen is usually spread on the finished work.

The tradition transmitted by the Tibetan historian Tāranātha, which probably derives from older sources of Nepalese origin, indicates that the Tibetans received their artistic training from Indian masters. The monastery of Nalanda, considered one of the most important centers from which Buddhist culture spread into Tibet, not only gave form to the religion, but also inspired the art of Tibet. Tāranātha relates that, under King Dharmapāla of the Pala dynasty, two artists who were so expert that their ability was credited to miraculous teaching worked at Nalanda; these artists, Dhīmān and Bitpālo, both executed paintings and modeled statues at the same time. Their statues were in the style of the so-called "Eastern school." In their paintings, however, they followed two different directions. Dhīmān remained faithful to the tenets of the "Eastern school," while Bitpālo was greatly influenced by the art of Madhya Pradesh (central India).

The tradition handed down by Tāranātha can be considered reliable, since Pala and Sena art (see PALA-SENA SCHOOLS) undoubtedly had a great influence on the development of Tibetan art; it must be remembered, however, that many other regions of India and other countries influenced Tibet not only in its culture and religion but also in its art. Apostles and masters came to Tibet from Central Asia, Swat, Kashmir, and Nepal and also from China during its periods of political expansion. The contemporaneous existence of many styles is proved by some inscriptions on temple paintings (e.g., those at Iwang),

Tabo, monastery complex with eight temples: (*a*) gTsug lag k'aṅ; (*b*) dkyil k'aṅ; (*c*) gSer k'aṅ; (*d*) ạBrom ston lha k'aṅ; (*e*) Sgo k'aṅ; (*f*) Byams pai lha k'aṅ; (*g*) ạBrom ston lha k'aṅ (c'uṅ); (*h*) dkar ạbyuṅ (*from G. Tucci, Indo-Tibetica, III, 1, 1935*).

where it is written that some of the works were executed in the style of *Li lugs* and others in that of *rGya lugs*. [*Li* means Khotan, and Central Asia in general, and *lugs* means manner or school; *rGya* is an ambiguous word that may signify *rGya nag* (China) or *rGya gar* (India). It seems clear from the surviving works that the artist at Iwang was referring to India and not China.] This temple dates back to a period much later than the Tibetan conquest of Central Asia and belongs to the time of Sa skya pa (13th cent.). Some paintings discovered by Tucci (*Santi e Briganti nel Tibet ignoto, Diario della spedizione nel Tibet Occidentale*, 1935, 1937, p. 161) in the small temple at Mangnang, in western Tibet, can be considered originals or accurate imitations of a style of painting that probably existed in Kashmir in about the 12th century. The paintings of the *lha k'aṅ* of Alchi, in Ladakh, can also be attributed to the Kashmir school, but to a much later period.

Although the influence of Kashmir gradually became weaker as it mixed with the increasingly important Nepalese style, it extended to almost all of western Tibet and the neighboring regions (e.g. Spiti). Standing figures were elongated, and a tendency toward the narrative was emphasized, especially in tankas depicting the lives of saints or themes from sacred books. Each episode is self-contained and is enclosed in a frame. Thus the painting seems to be divided into many small panels.

With the advent of the Sa skya pa and the consolidation of their power, the China of the Yüan made its influence felt. While the Sa skya pa maintained close contact with Nepal for religious reasons — because they had begun the work of revising the sacred writings, later completed by Bu-ston (1290–1364), and because they had tried to foster a knowledge of Sanskrit by enriching their libraries with original texts in that language — for political reasons they appointed "imperial masters" (*ti shih*), who maintained continuous contact with the Mongolian dynasty. Many of them made frequent trips to China, sojourning there for long periods of time. This situation resulted in a cultural revival that affected all aspects of life and was especially notable in the arts. For example, the Chinese influence in the monastery of Shalu (residence of the writer Bu-ston) and its decoration is evident: sources assert that artists

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

were called from China and Mongolia to work on its construction (*Myaṅ c'uṅ*; Tucci, 1932–41, IV, p. 25).

This stylistic synthesis was checked and later definitively overcome by the prevalent Nepalese style, to which the great Sakya abbots were closely linked culturally because of their ties with the schools and masters of Nepal. In the 17th and 18th centuries, when contacts with China became more frequent and intense and Tibet finally came under Chinese rule, the Chinese provincial style became predominant, especially in the eastern regions (e.g., Kham). The prevalence of one style over another often depended upon the cultural links of the monasteries and upon the places with which they had greatest contact. The development in Tibet of these various styles does not depend only on historical events, but is also related to geographical factors and the cultural trends of the various monasteries.

Although Tibetan painting was influenced by various foreign styles, it was not lacking in a character of its own. Tibetan painting is religious painting that translates an experience symbolically by means of images, aiming at a religious and not an esthetic impact on the viewer. It follows mandatory schemes that had been established and elaborated in India in a well-known iconographic literature (*pratimālakṣaṇa*), which had been translated into Tibetan.

Painting in Tibet is not regarded as an expression of the creative imagination. It is an act of cult and therefore must conform to fixed norms, precisely defined in that literature which established the proportions in which the image is to be constructed. These paintings generally are rich compositions; Buddhas, bodhisattvas, and other divinities are almost never depicted alone but are portrayed with impressive retinues of acolytes. In other representations these deities dominate the composition amid a choir of elect in their own paradises (žiṅ kīams; II, PL. 385). The essential schemes of these paradises also are defined by a literature dedicated to them that sets forth the manner in which they must be depicted. Everything that is divine is unalterable and cannot be left to the artist's choice, lest the sacred character of the painting be diminished.

Except for gold, the colors, too, are unalterable. Gold represents all colors and is used in a particular type of tanka (*gser t'aṅ*), in which figures outlined in black stand out distinctly against a gold background; other colors are added to give the figures emphasis (PL. 35). Colors are important as indications of the aspect under which the divinity is represented. For example, a god in his calm aspect (*ži*) is represented in white; in a combative or terrifying aspect (*k'ro bo*) he is depicted in red or dark blue (II, PL. 387). Bodhisattvas are separated into groups according to their dependence on the five Buddhas of the supreme pentad (see BUDDHISM). The Buddhas and all the bodhisattvas and other divinities descended from them or connected with them through spiritual links or relationships have each their own particular color. Even in the choice of color, therefore, the artist is not free.

These inviolable rules resulted in the often inexpressive, conventional, and hieratic images of the Buddha or of other divinities that are the principal elements in the paintings. They are flat, remote projections, without chiaroscuro and relief; rarely do they suggest that interior reflectiveness that was expressed so well in Indian painting, as in the Bodhisattva with flower (Padmapāni ?) of Ajanta (I, PL. 48). The artist is generally free to follow his creative imagination in the details and the arabesques that adorn garments; for this reason Tibetan artists were able to make an easy transition into decorative art and miniatures.

These restrictions did not completely prohibit the painter from showing his inventive ability and skill in composition. This type of artistic expression can be found primarily in paintings dedicated to the lives of the Masters. The above-mentioned older examples, divided into separate sequences, were supplanted by paintings of greater breadth, in which schematic treatment is avoided and themes are freely developed. Aspects of Tibetan life and landscape are depicted with lively colors and much animation: there are processions of chanting monks or of pilgrims, small white houses hidden in green meadows, racing horsemen, and dream landscapes with rolling mountains and capricious clouds hovering in the infinite turquoise sky (PLS. 46, 47). As early as the period of the Sa skya pa these landscapes showed the Chinese influence which later became increasingly strong and precise, especially in the schools that grew up in the large monasteries (as in Tashilumpo), and which culminated in the painting of Kham. The landscape became an echo of Chinese landscape, and although sometimes remote, is always recognizable. However, it lacks the lightness of the Chinese landscape; everything — figures, mountains, and animals (phoenix, peacock, and gazelle) — becomes heavier but does lose a certain childlike grace. The Tibetan artist gloried in pure color; his palette had no nuances, and the only gradations were achieved by mixing different amounts of lime with the colors. The undeniable fascination of these paintings lies not only in their revelation of the life of the people but also in their brilliant colors, sometimes vivacious and always artfully juxtaposed in masses of green, red, and turquoise.

As the Chinese influence gradually grew stronger, another characteristic of Tibetan painting became evident. In ancient paintings almost no part of the surface is left free; it is completely covered with images, figures, and symbols, and the colors have an almost uniform tonality in which red dominates. This dense and monotonous composition gave way to a more airy conception, in which the figure stands alone in a space that gives breadth and emphasis to the work. Sometimes a bird is shown flashing through the air or the bare outlines of a flower are drawn in swift strokes. The style of the tanka sometimes depends on the subject depicted. In representations of the cycles of the *c'os skyoṅ*, the *sruṅ ma*, and the terrifying deities worshiped in the *mgon k'aṅ*, violent tones — especially red and black — predominate, and the symbols reproduced (skulls, offerings strewn with intestines and bloody flesh, and skulls brimming with blood) evoke the terrifying world that inspires them.

Though Tibetan painting is derived from or influenced by Indian and Chinese painting, it cannot be favorably compared with either. It suffers from overproduction. Only the poorest monasteries and private houses are without an abundance of tankas, and their quantity is overwhelming. Moreover, the mandatory sacred themes left little margin of creativity for the artist. With rare exceptions, the tankas, as acts of faith and devotion, are anonymous. Artists' names are found only occasionally in frescoes on the walls of large temples or in palace chapels. Many painters are named in the inscriptions of the *sKu ạbum* in Gyantse. As mentioned above, in these cases a distinction is made between the person who conceived the plan and the artist who executed it. The former is a monk; the latter is the painter, whose skill is generally measured by his ability to combine colors. The anonymous authorship and the lack of any chronological information make any dating of the tankas exceedingly difficult, unless some pertinent information can be drawn from the biographies of some of the Masters or from reports made by the donors about works commissioned by them.

Theoretically it is easier to date the wall paintings, because they are often accompanied by inscriptions that contain the name of the donor (*sbyin bdag*) in addition to that of the designer or painter. Frequently they also name the lamas who dictated the inscriptions or consecrated the paintings. Like all other images, a painting has no liturgical significance if it has not first been consecrated in a ritual ceremony (known as *rab gnas*). During the rite three symbolic syllables are written on the back of the image, at its head, neck, and heart; in special cases dedicatory inscriptions and the hand prints in red of the lama who consecrated them are added.

The painters are not always monks; some are laymen whose art has been handed down from father to son and whose textbooks are Tibetan versions of Indian iconographic treatises. In some monasteries, however, there are monks who have learned the art of painting along with other disciplines. In the printing shops of the larger monasteries, texts and tankas or series of tankas are engraved on wooden matrices (subjects include the lives of the Buddha, of the 16 or 18 arhats, of the great Masters, and of the Panchen Lama). Pilgrims carry copies of these back to their own districts; the result is a widespread

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

uniformity of execution of the schemes. Local painters were inspired by those woodcuts, which had prestige because they originated in the famous monasteries, and often they actually copied them. Thus in the most diverse parts of Tibet are reproduced, without any variations, the same versions of identical subjects.

In illuminated manuscripts, which are common in Tibet, Tibetan artists have imitated the Indians and Nepalese (cf. VIII, PL. 358). Whereas images of divinities and the Buddhist Masters appear on the first and last pages of printed texts, there are many manuscripts in which the inside pages also are decorated with miniatures. Many books, especially those which contain widely read works, such as the *Šer p'yin* or *Pīar p'yin*, are written in characters of silver or gold on large sheets of paper that are often tinted dark blue (with a mixture of water and powder of lapis lazuli). These works are often protected by finely carved and gilded wooden end boards (*glegs šin*), derived from the Indian *pālaka*. The predominant motifs on these end boards are the five Buddhas and the goddess Šer p'yin, surrounded by minor divinities and by carefully executed floral motifs. Some end boards were imported from India and Nepal and were used as models by Tibetan artists.

SCULPTURE. The term sculpture is inappropriate to Tibetan images in metal, because they are made by the lost-wax process. The preferred metal is bronze (*li*), which is used in various alloys and colors (PLS. 48, 49). Copper (*zaṅs*) and brass (*ra gan*) are also used. The most valuable statues are made of an alloy of eight metals similar to the *aṣṭadhātu* of India. There is very little stone sculpture, but technical treatises mention, in addition to alabaster, soft stone (*rdo mñen*). Rock-crystal images are imported from Nepal or made by Nepalese artists. Many images are made of terra cotta. Others, modeled of a mixture of earth and straw mounted on a wooden armature, are spread with a thin layer of plaster to receive the color; the technical term for such images is *bzo sku* or *lde sku*. Still other images are fashioned of papier-mâché.

Most of the bronze statues are gilded in painstaking processes that are not completely known. Often, in statues used for liturgical purposes, temporary gilding is added; it is limited to the face (*žal gser*) and is renewed regularly.

In sculpture, too, Tibet is indebted to those countries from which it drew its religion. According to Tibetan tradition, many statues have been imported into Tibet since the time of the first introduction of Buddhism and even since the time of King Sroṅ btsan sgam po. One of these is the Jobo, an image of the Buddha which the king's Chinese wife is said to have brought with her from China (it had originated in India) and which tradition attributes to Viśvakarma, the "architect of the gods." Presently in the Jo k'aṅ (aP'rul snaṅ) in Lhasa, it is certainly not the original. The statue of sGrol ma (Tārā) was brought to Lhasa by the king's Nepalese wife, along with the statue of Jo bo mi bskyod rdo rje, which is also attributed to Viśvakarma and worshiped in the Ramoche temple. The statue of Avalokiteśvara in the Jo k'aṅ is said by some writers to have appeared miraculously together with statues of acolytes while a Nepalese artist was preparing to model it, but according to Bu-ston it came to Tibet from southern India. The treatise writers have traced the various styles to their origins in Indian schools. These styles had initially been inspired by others in use in India, among the Uigurs, in Tibet at the time of the royal dynasty, and in ancient and in modern China. The styles that came to Tibet from India were many, differing according to the region from which they came: central, eastern, northern, southern, and western India, the latter including Kashmir.

Especially during the early years of the spread of Buddhism, there was a large-scale importation of Buddhist statues to Tibet from India and elsewhere that was fostered by the missionaries and Buddhist Masters, each of whom brought with him the image of his own *yi dam* (protective deity), which, upon his death, remained as an object of veneration in the temple where he had lived. An example is the image of Tārā which, according to tradition, belonged to Atīśa and which is now at Netang, where the Master is buried. It is also known that Rin c'en bzaṅ po sent for artists from Kashmir; some of them are named in sources. There is no doubt that the doorposts of Tabo with panels illustrating the life of the Buddha are the work of artists from Kashmir.

Some bronze statues surviving in the ruins of the temples of Tsaparang and Toling reveal the same origins, though it is not certain whether these came to western Tibet at the time of Rin c'en bzaṅ po or later. Some bronze statues that can be seen at bSam yas reveal the influence of Pala art; but some statues recently discovered in Swat are similar to others from the temples of western Tibet. This confirms the fact that art followed the same path of penetration as religion. Tibetan sculpture became increasingly indebted to that of Nepal, under whose influence an artistic koine was gradually established, enduring until new manners and trends from China modified sculpture as they did painting. Nepalese artists were active throughout Tibet at Sakya and then at Lhasa (where even now the Nepalese are primarily jewelers and metalworkers), at Tsetang, and at Tashilumpo.

According to tradition Luk, in western Tibet, now a modest village, was, at the time of the kings of Guge, an important center for the production of statues. There was another center at rTa nag in Tsang; many other production centers were in Kham and were, naturally, strongly subject to Chinese influence.

Like painting, and perhaps to an even greater degree, sculpture is bound by a strict iconography. Because of this there is considerable rigidity in the statues, and only a few succeed in expressing the serene contemplation of the Buddha: the mood of contemplative absorption that the images should portray is almost always weakened by an abstract, conventional scheme. The artists achieve more powerful representations in their depictions of terrifying deities (XIII, PL. 466) either prepared to meet the assault of demoniacal forces or performing a frenetic dance after having exterminated them (see TERROR AND THE MALIGN). Also more effective are the coupled statues of Tantric deities that represent the fusion of the active force, the method, with the compassion and gnosis that must be pervaded by the method in order to attain nirvana. These images are generally endowed with many heads and often with arms that are raised, each hand holding a weapon or ritual object; the resulting rhythms of moving masses are striking in their effect.

In some cases, as in the images of the *dvārapāla* (custodians of the doorway), which are believed to maintain the sacred character of a place, the influences of Chinese art are evident; however, the Tantric divinities, though primarily inspired by Nepalese examples, are stamped with a particular character that is a creation of the Tibetans. The same is true of painting, which achieves its greatest power of expression in its depictions of the Tantric cycles, demonstrating the tendency of the Tibetan artist to be most affected by and therefore to depict appropriately the demonic or the monstrous. His work is constantly inspired by the belief, fostered by Buddhism, that these divinities, whose appearance is so frightening, are basically only combative aspects of essentially merciful and protective deities. The images represent the vast pantheon of the Mahāyāna and the Vajrayāna and are inspired by the literature of the *sādhana*, which gives minute instructions about the liturgical rites that accompany the evocation and describes in detail the color, throne (*k'ri*), ornaments, the position in which the divinity sits, the *p'yag rgya* (gestures; cf. II, FIG. 690), the hair style, shape of the diadems and jewels, number of heads and arms, and the objects, symbols, or weapons held. These elements, which are immutable, make up the iconography of each divinity. When there are no inscriptions, these are the only data that permit certain identification of the god represented. The iconographic literature of Tibet is much more vast than that preserved in Sanskrit, and it constitutes an indispensable guide for recognizing the various divinities.

Among the divinities most often represented are sPyan ras gzigs (Avalokiteśvara), patron of Tibet, and sGrol ma (Tārā); both are invoked against the eight principal dangers that threaten man (e.g., fire, water, thieves). Together with aJam dpal (Mañjuśrī, PL. 48, right), they constitute the triad of deities (*rigs gsum mgon po*) who protect Tibet. Representations of

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

sPyan ras gzigs may take many forms, from the most common, with four arms, to another with eleven heads (Žal bcu gcig) and still another with a thousand arms and a thousand eyes (an eye in the palm of each hand, P'yag stoṅ spyan stoṅ). Images of Tārā, in one of 21 principal manifestations, of Ša kya t'ub pa (Šākyamuni), and of the *yi dam*, personal protective divinities, are generally found in private chapels. The images of Rin po c'e (the precious master), Padmasaṃbhava (the second Buddha), and, for the followers of the dGe lugs pa school, the image of Tsoṅ k'a pa, are also common.

Tibetan artists excelled in the execution of portraits and achieved much more striking effects in sculpture than in painting. The images of great Buddhist Masters and ascetics are innumerable (PL. 49). Though the subjects are wrapped in their garments and seated in the hieratic position, these statues have none of the conventionality of the images of the gods, because the artists succeeded in capturing the spiritual as well as the physical qualities of the persons represented.

Statues were also executed in richly painted clay and terra cotta. Some of the temples in Tsaparang contain fine examples of this type of image. They stand out against backgrounds frescoed with myriad small figures of divinities. Another example is to be found in the temple of Chasa (Bya sa), which dates back to the early times of the second introduction of Buddhism (12th–13th cent.). Along its walls are aligned large images of standing bodhisattvas in luxurious garments that reproduce Sassanian fabrics.

As the proportions of these statues were magnified (they often were several meters high), they came increasingly under the category of artisan work and occupied many craftsmen simultaneously. The iconographic schemes were still scrupulously respected, and the primary factor in the work was its grandiosity, which assured greater merit to its creator and to its patron. The craftsman could give free rein to his ability and skill only in the decoration and ornamentation.

Although this art is generally anonymous, the names of some artists are mentioned in scientific treatises; two such artists — Pad ma mk'ar pa and sLeu c'uṅ — are praised as founders of a school of art. The Tibetan artistic criteria of the beauty of a statue are always based on the exactness of the proportions, the care with which minor details — such as fingers, toes, embroidery, and fabric designs — are executed, and the smoothness and finish of the surface, which must be polished and nonporous (PL. 49, right).

An exact chronology of Tibetan sculpture is difficult to establish. Rarely do the statues bear datable inscriptions. Since the works are without the elements that are helpful in dating paintings (e.g., colors, landscape, perspective), it is much more difficult to distinguish schools and traditions in the large artisan production of sculpture. However, Tibetan tradition established the date of the oldest statues, those executed at the time of the kings of Tibet, as being immediately after the introduction of Buddhism and before the attempt of Glaṅ dar ma to suppress this religion. It has divided this ancient period into three phases: that of the most ancient kings, that of the kings of the middle period, and that of the last c'os rgyal. The criteria used are primarily extrinsic, but there are references to the Indian styles that influenced Tibetan statues (the oldest statues are compared to those of southern India). All this is mentioned very generally in the treatises; however, the oldest statues that survived the successive destruction and ruin of the monasteries, even when not actual originals, can easily be traced to Indian models and can be dated approximately on the basis of similarities and differences. This is true of the oldest examples, in which Tibetan artists followed their models, with the same fidelity with which they translated sacred texts and in which the influence of frequent political and cultural contacts with bordering countries was notable. Within a short time these influences were crystallized in a conventional art that, with rare exceptions, stifled almost completely all creative impulse. Once this koine had been established, any basis for comparison disappeared, and only such elements as weight, gilding, patina, and inscriptions remained as aids in dating the works.

Stone sculpture in the round is rare in Tibet, not because of a lack of raw material but because copper and bronze images were easily transportable by the Indian Masters and Tibetan pilgrims returning from India. These images were immediately taken up as models, and their style and popularity soon spread. The art of metalworking, primarily in its application for military purposes and in the decoration of weapons, had long flourished in Tibet; it was a simple matter to apply the established techniques of the art to religious ends.

Among the few examples of stone sculpture, literary sources cite a statue of Sroṅ btsan sgam po on his tomb and statues of the rigs gsum mgon po and rGyal ba rigs lṅa in Tantrup (K'ra ạbrug), attributed to the same epoch. That this art actually existed is confirmed by the stone lion recently published by H. Richardson (1936). This lion is from the tomb of King Ral pa can and is surely derived from Chinese models of the T'ang period (e.g., the guardian lion on the tomb of Kao-tsung).

The use of sculptured reliefs is limited to symbolic decorative elements [e.g., the base of the stele of Karchung (sKar c'uṅ)]; they have appeared since the time of the kings on pillars surmounting tombs or on those bearing engraved edicts.

MINOR ARTS AND HANDICRAFTS. The Tibetan's native taste for decoration, his technical skill, and his love of beautiful objects (even though these may sometimes be overloaded and rather baroque) find expression in handicrafts and the minor arts. Two types of objects are noteworthy in this respect: those devised for everyday domestic use and those created for liturgical use (see LITURGICAL AND RITUAL OBJECTS). Among the domestic objects are brass and copper teapots (PLS. 50, below right; 51). The handle and neck are often of finely engraved and embossed silver. Equally remarkable are the *takia* (more properly known as *žal k'yog*). These consist of a round plate on a cylindrical base; the plate has a depression in the center to hold the cup (*dkar yol*). They are often of jadeite or agate, with a lid that terminates in a piece of coral. Both the support and lid are embossed. The decoration is inspired by religious or auspicious motifs such as the seven gems (symbol of regal dignity) or the eight symbols of good omen (*bkra šis rtags brgyad*; umbrella, vase, fish, wheel, shell, lotus, standard, knot), surrounded by friezes, decoratve scrolls, and floral motifs. There are *takia* in gold and silver and also in thin steel with damascening in gold. Large copper vases (silver is used by wealthy families) keep food warm; sword scabbards are richly decorated with arabesques and set with turquoises and coral. The Tibetans wear a *gau*, or charm box, hanging from their necks or on their belts, especially when traveling. The *gau* is rounded on the top and contains formulas or, more often, small images wrapped in pieces of cloth. The image is visible through a small glass window on the lid of the box. Most *gau* are made of copper, copper and silver, or embossed silver decorated with the abovementioned symbols or, as also is true of the sword scabbards, with motifs derived from steppe art. The objects executed in Kham are particularly outstanding.

There are many kinds of liturgical objects. Among the most common, because it is indispensable for worship, is the lamp (*mar me*) that must always be lit on the altars in front of the images. These lamps are bowl-shaped and rest on a base at whose center often appears the motif of the *bum pa*, the vase of celestial ambrosia. Other indispensable objects are the *dřil bu* (small bell; IX, PL. 176) and the *rdo rje*, which is shaped like the double thunderbolt of Zeus and is inspired by the club held by Indra in traditional Indian iconography (II, FIG. 686). These objects have a complex symbolism; one is held in the left hand and the other in the right, in the various *p'yag rgya* (hand positions) without which the rite would not achieve its purpose. Also noteworthy is the *rus rgyan*, a kind of breastplate worn by the officiant during particular rites, primarily of an exorcizing nature. It is made of bone plaques (often of human bone) on which Tantric divinities are sculptured in relief. The plaques are held together by strings of bone beads. Equally important are the trays used for arranging the offerings (*gtor ma*) on the altars and the vases (*bum pa*) for sacrificial water (IX, PL. 177). In the decoration of this work the Chinese influence rather than the Indian predominates.

TIEPOLO, GIOVANNI BATTISTA, GIOVANNI DOMENICO, LORENZO BALDISSERA. Venetian painters of the 18th century, dominated by the personality of Giovanni Battista, one of the greatest exponents of 18th-century painting, who brought Venetian art back to a position of European importance, renewing the tradition of the great painters of the 16th century, in particular of Paolo Veronese (q.v.).

SUMMARY. Giovanni Battista (col. 82). Giovanni Domenico (col. 90). Lorenzo Baldissera (col. 94).

GIOVANNI BATTISTA. Born in Venice on Mar. 5, 1696, son of Domenico Tiepolo, a merchant and co-owner of a ship. In 1719 Giovanni Battista married Maria Cecilia Guardi, sister of the painters Giovanni Antonio and Francesco; she bore him nine children, including Giovanni Domenico and Lorenzo Baldissera, who later became his assistants. He died on Mar. 17, 1770, at Madrid, while in the service of the king of Spain.

Giovanni Battista was apprenticed at an early age in the workshop of Gregorio Lazzarini, from whom he learned a grandiose decorative style; but he soon surpassed his master's teaching, his nature, all "fire and spirit" (Moschini, 1806), preferring a bolder and more fluent style. His name appears in the Venetian painters' confraternity in 1717, but even prior to this date he had given proof of his independence and talent in *The Sacrifice of Abraham* (1715/1716) in the Church of S. Maria dei Dereletti (of the Ospedaletto), Venice, and in the lost *Crossing of the Red Sea* (1716), exhibited on the feast day of St. Roch in front of the Church of S. Rocco, Venice. (The painter remained particularly faithful to St. Roch and later painted a number of small canvases representing the pilgrim saint.) However, the earliest surviving signed and dated work by Giovanni Battista is the *Repudiation of Hagar* (1717/1719; Milan, Coll. Rasini), which reveals a taste for compositions using diagonal perspective and for large masses forming sharp contrasts of light and shade. Other commissions followed shortly, confirming the success of the young artist: the *Martyrdom of St. Bartholomew* (XII, PL. 368), the *Madonna of Mt. Carmel and the Souls in Purgatory* (PL. 57), and the works (1720–22) executed for Doge Giovanni II Cornaro, consisting of "overdoors with portraits and paintings of great accomplishment" that have since disappeared.

The earliest of Giovanni Battista's surviving frescoes is the *Apotheosis of St. Theresa* (ca. 1720) in the Church of S. Maria di Nazareth (of the Scalzi), Venice. This work marks the first documented instance in Tiepolo's career of the collaboration, in the ornamental and perspective parts, of the painter Girolamo Mingozzi (Colonna). This perspectivist, who worked in the tradition of Galli Bibiena, was Tiepolo's partner in all the more important frescoes.

The period of Giovanni Battista's youthful activity in Venice closed with the frescoes (ca. 1724–25) for Palazzo Sandi (now Cipollato), *The Power of Eloquence* (PL. 65), a sketch for which is in the Seilern Collection, London. For the same palace he supplied three canvases: *Ulysses Discovering Achilles among the Daughters of Lycomedes*, *Hercules and Antaeus*, and *Apollo and Marsyas* (now Castelgomberto, Vicenza, Coll. Schio). Despite baroque residuals and a certain tendency to exaggeration typical of his early years, the impetuous and forceful style of the young artist as a fresco painter in the grand heroic style was already fully developed.

About 1725 Archbishop Dionisio Dolfin summoned Tiepolo to fresco the Palazzo Arcivescovile, Udine. The decoration of the grand staircase, with the *Fall of the Rebel Angels*, of the Galleria, with *Rachel Hiding the Idols* (PL. 57), and of the Sala Rossa, with the *Judgment of Solomon*, represents a decisive moment in the history of Venetian painting, for the imaginative pictorial interpretation combined with passages completely new to the artistic repertory of the period. During the years at Udine Tiepolo also painted frescoes (1726) in the Chapel of the Sacrament in the Cathedral and various decorations, also in fresco, in the great hall of the castle.

Commissions outside Venice followed one another in quick succession. In 1731 the artist was in Milan, where he frescoed

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

five ceilings in the Palazzo Archinto: *Triumph of the Arts, Phaeton and Apollo, Perseus and Andromeda, Juno with Fortune and Venus*, and *Nobility* (all completely destroyed during World War II). He also painted the main hall of Palazzo Dugnani (formerly Casati) with the allegory of Magnanimity on the ceiling and, on the walls, Scipio in scenes illustrating his magnanimity and Sophonisba receiving the poison from Massinissa (VII, PL. 269). In both these Milanese decorative groups another step toward the control of light, a more ethereal interpretation of pictorial masses, a clearer break from tradition, and a greater coherence in the over-all conception are evident.

In September, 1732, he was in Bergamo, where he frescoed the vault of the Cappella Colleoni with allegorical figures of Justice, Wisdom, Faith, and Charity; in the lunettes of the choir he painted a St. Mark and the *Martyrdom of St. Bartholomew*. In the autumn of the following year he was again employed in the same chapel painting scenes from the life of John the Baptist: *John the Baptist Preaching*, the *Baptism of Christ*, and the *Decapitation of John the Baptist*. Tiepolo's works made a strong and deep impression on the painters of Bergamo, where he had a number of pupils and imitators.

The orientation of Giovanni Battista's style toward the formal classicism that later characterized his mature works began to manifest itself in the frescoes of Villa Loschi at Biron (Vicenza), on which he worked for three months in the autumn of 1734. The themes suggested by the patron were secular allegories: on the ceiling of the staircase Time unveiling Truth and on that of the main hall the allegory of Justice, Fortitude, Temperance, and Truth, with various scenes representing the Triumph of the Virtues along the walls.

The painter's fame was such that in 1736 the Swedish ambassador to Venice, Count G. de Tessin, attempted to negotiate a commission for him to decorate the Royal Palace at Stockholm, but without reaching an agreement. One of the Count's letters states that Tiepolo was working for the Cornaro family for six months in 1736, most probably on the frescoes executed for Palazzo Cornaro di S. Maurizio at Merlengo (Treviso), illustrating the story of Iphigenia (now too damaged to permit critical evaluation).

In 1737 Tiepolo was again in Milan, where he frescoed the Chapel of S. Vittore in the Church of S. Ambrogio (*Martyrdom of St. Victor, Shipwreck of St. Satirus*) and the ceiling of the sacristy (*Glory of St. Bernard*; destroyed during World War II). Simultaneously he was drawing up the contract for the vault decoration of the Church of the Gesuati (S. Maria del Rosario), Venice, on which he worked sporadically, completing it in October, 1739. In the three compartments of the vault — *St. Dominic Instituting the Rosary* (PL. 59), *St. Dominic in Glory*, and the *Virgin Hearing the Saint's Prayers* — he adopted a strongly foreshortened perspective, achieving a dazzling spatial illusionism. Immediately afterward Tiepolo suggested the themes for the paintings for the Scuola dei Carmini, of which the ethereal and radiant *Madonna of Mt. Carmel* is dated 1740. Also from 1740 are the frescoes of Palazzo Clerici at Milan, where he painted the *Course of the Sun on Olympus*, of unparalleled imaginativeness. The artist was, in fact, at the threshold of his full maturity and success. In the 1740s he accepted a great many commissions; religious and secular subjects followed one another uninterruptedly, constantly renewed by his inexhaustible inventiveness. The religious masterpiece of these years, also his most complex work, is the vault of the Church of the Scalzi, Venice (1743–44), where, with the help of Mingozzi, he painted a fresco (destroyed during World War I) of the miracle of the Holy House of Loreto, placing the composition in the infinite vastness of a sky imbued with an intense luminosity.

From this period onward Giovanni Battista was to dedicate his major efforts in fresco painting almost exclusively to secular subjects. In the summer and autumn of 1743 he decorated Villa Cordellina at Montecchio Maggiore (Vicenza) with historical subjects. The villa has been restored and the ceiling fresco representing Nobility and Virtue, transferred in 1917 to the Museo Civico at Vicenza, has been returned. The two vast scenes on the walls of the villa (*The Magnanimity of Scipio* and *The Family of Darius before Alexander*), in the luminosity of their colors, preface the frescoes at Palazzo Labia. During this decade he executed numerous large-scale secular decorations for Venetian palaces: the frescoes for Palazzo Barbarigo, *Time Revealing Truth* and the *Allegory of Fortitude and Wisdom* (1744–45; the latter, on canvas, now at Venice, Ca' Rezzonico); the *Triumph of Zephyr and Flora* for Palazzo Pesaro (now also at Ca' Rezzonico); the admirable ceiling fresco of Mars and Venus for Palazzo Pisani Moretta; and the important complex for Palazzo Barbaro, comprising the ceiling fresco, the *Apotheosis of Francesco Barbaro* (Met. Mus.), and four overdoors on canvas: the *Gifts Offered to Cleopatra* (Pavia, Coll. Necchi), *Timoclea and the Thracian Commander* (Washington, Nat. Gall.), *Tarquin and Lucretia* (Augsburg, Bayerische Staatsgemäldesamml.), and the *Betrothal* (Copenhagen, Statens Mus. for Kunst). To these are to be added the frescoes for Palazzo Papadopoli; those for Palazzo Sagredo (now Milan, Coll. M. Crespi; Bergamo, private coll.); and two splendid ceiling canvases — *The Triumph of Fortitude and Virtue*, originally painted for Palazzo Servi-Manin, and the *Marriage Allegory of the Casa Cornaro*, executed for Palazzo Corner Mocenigo (both, Florence, Coll. Contini Bonacossi).

To this period belongs the most famous cycle of frescoes executed by Tiepolo in Italy: that for Palazzo Labia, with the story of Anthony and Cleopatra (PL. 60), completed before his journey to Germany and not in 1757 as claimed by H. Modern (1902), who based his argument on a misread date. With the collaboration of Mingozzi on the ornamental parts, Tiepolo realized a beautiful example of pictorial illusionism. The strong lines are of crystalline purity; the colors are vivid and luminous and the skies increasingly transparent. Shortly before leaving for Germany, possibly in the summer of 1750, the painter completed the frescoes of Villa Contarini at Mira (now Paris, Mus. Jacquemart-André), commemorating the visit of Henry III in 1574. Never has historical reality been interpreted with such immediacy and richness of detail as in the exact descriptions of a society that Tiepolo noted with good-natured malice.

Toward the end of 1750 Tiepolo left for Würzburg, engaged by the prince-bishop, Carl Philipp von Greiffenclau, to decorate his sumptuous Residenz, which was being completed by the gifted architect Balthasar Neumann. Tiepolo's sons Giovanni Domenico and Lorenzo accompanied him. The artist began by frescoing the Kaisersaal, with, on the ceiling, *Apollo Conducting to Barbarossa His Bride, Beatrice of Burgundy*, and on the walls the *Wedding of Barbarossa* (X, PL. 312) and the *Investiture of Bishop Harold* (PL. 60), dated 1752 and completed on July 4. In the same year he sketched the designs for the large fresco for the staircase, executed in 1753.

The frescoes at Würzburg mark one of the most successful phases of Tiepolo's career. Confronted with a difficult iconographic theme, the artist succeeded in creating, in the Kaisersaal, a decorative complex that, in its combination of the white of the stuccoes set off by gold and in the sparkling gaiety of the colors, forms one of the most striking creations of the period. An even more formidable achievement is the decoration of the great staircase, in which the four parts of the world then known (XI, PL. 109) are exalted in a sort of pagan-Christian cosmorama. Tiepolo here brought together a whole iconographically fantastic congeries of races, costumes, and fauna and flora, with multicolored crowds of pagan deities and mythological, symbolical, and allegorical figures alternating with splendid groups of contemporaneous court figures who convey a note of out-of-place reality in this immense aerial stage. In the Residenz frescoes Tiepolo's technique reached its peak. Light has a crystal transparency; the figures, apparently floating in space, are set off by their brilliant tones. The two pictorial complexes completed by Tiepolo during his three years at Würzburg were to provide a durable and unsurpassed model for German art, as Tiepolo's influence surpassed local limits and extended throughout southern Germany and to Austria in particular.

After leaving Franconia for Italy toward the end of 1753, Tiepolo worked without pause. In June, 1754, he began the vault decoration of the Church of S. Maria della Pietà, and by August of the following year he had completed the large central

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

fresco (*The Triumph of Faith*; PL. 59) and the two minor scenes, one depicting Faith, Hope, and Charity and the other David and the Angel. His usual themes were combined with fresh inventions creating a mystical, religious vision of rhythmic tonalities and an ever-increasing transparency that finally dissolves into infinity. Most probably the frescoes of Villa Soderini, Nervesa (destroyed 1917), date from 1754. In the great hall Tiepolo, in collaboration with Mingozzi, returned to the representation of a historical theme, the exploits of the Soderini, with the Apotheosis of the Soderini family on the ceiling, and on the walls the entry of the Gonfaloniere Pier Soderini into Florence and Nicola Soderini in the Roman senate.

After his stay at Würzburg Tiepolo entered a new stylistic phase represented, in its maturity, by the frescoes of 1757 for Villa Valmarana ("Villa of the Nani") at Vicenza (PL. 61), formerly dated twenty years earlier. The discovery of their exact dating has contributed greatly to the understanding of Tiepolo's artistic evolution, making it possible to distinguish the style of Giovanni Battista from that of his son Giovanni Domenico, who collaborated with his father in the so-called "Foresteria" (guesthouse). In the frescoes of Villa Valmarana (Sala dell'Iliade, Sala dell'Eneide, Sala dell'Orlando Furioso, Sala della Gerusalemme Liberata, in the Palazzina; Sala dell'Olimpo, in the "Foresteria"), the unusual subjects drew completely new solutions and ideas from Tiepolo's inexhaustible imagination: his palette of delicate tones is exceptionally refined and sparkling; the line is vibrant, fragile, and exquisite in its lightness, the figural and decorative ensemble leaning toward the playfulness of the French rococo.

Also of this period is the decoration of the great hall of Palazzo Trento-Valmarana, Vicenza, on the ceiling of which the artist painted four allegorical tondos with, in the center, the *Triumph of Truth over Error*, a work of admirable invention (destroyed 1945). The following year he began the decoration of two ceilings in fresco with a nuptial allegory and an allegory of Merit in Ca' Rezzonico, Venice, reviving with new themes the Würzburg compositions. In 1759, after more than thirty years, he returned to Udine and painted, with the collaboration of Giovanni Domenico on the monochromes, the Assumption on the vault of the Church of the Purità; this work, of sensitive line and diaphanous tonality, was executed in the incredibly short space of 32 days. Tiepolo's art, especially in his ceiling frescoes, was at this point entirely aimed at rendering the extreme delicacy of atmospheric tones in the figures, which become increasingly light in weight, enveloped in an iridescence of color.

In the next two years, before his departure for Spain, Tiepolo continued to work incessantly. In 1761 he painted the frescoes in Palazzo Canossa, Verona, with the marvelous *Triumph of Hercules*, which in some ways anticipated the imposing works realized later at Madrid. Between autumn of the same year and the first months of 1762 he completed the ceiling of Villa Pisani at Strà, with the *Apotheosis of the Pisani Family* (PL. 61), one of his most complex pictorial creations, also a prelude to the Spanish works.

In 1761 Charles III of Spain asked Tiepolo to decorate the new Royal Palace in Madrid. The negotiations were protracted until the painter was ordered by the Doge of Venice to abandon his work at Villa Pisani and leave for Spain in April, 1762. He was accompanied by his sons Giovanni Domenico and Lorenzo. The difficult journey lasted until June and Tiepolo arrived ill and tired at Madrid. His most difficult undertaking was the vast fresco for the Throne Room, the *Apotheosis of Spain*, dated 1764, in which Tiepolo seems to reecho, almost as if in a last summing-up, all the creations of his imagination, alternating allegorical and symbolical episodes. This was followed by two minor frescoes representing, in the Guardroom (Hall of the Halberdiers), *Aeneas Led to the Temple of Venus*, and in the Queen's Antechamber, the *Apotheosis of the Spanish Monarchy*.

The painter seemed to withdraw into himself, his creative force ebbing and the impetus of his fantasy no longer at its former strength. The story of Tiepolo's last years in Spain is a sad one. At the close of his brilliant career the great painter found himself misunderstood, opposed, and obstructed. A shadow was cast on his fame by the presence at court of Anton Raphael Mengs, the promoter of a return to classicism, who was protected by important prelates who did not approve of the pagan flavor of Tiepolo's works. But the old painter, although embittered, continued to work. In 1769 he was commissioned to fresco the apse of the Church of S. Ildefonso, Aranjuez, and he immediately presented the preparatory designs to the king. Death overcame him on Mar. 27, 1770, at work at his easel; he was probably giving the finishing touches to the *St. Pascal Baylon*, which was later engraved by Giovanni Domenico with the moving attestation that the painting was completed "ante suum decessum."

Although Tiepolo's most successful achievements were his fresco paintings, his almost limitless creativity was no less forceful or intense in his easel paintings: from the great scenographic schemes to the numerous smaller canvases, whether sketches, projects, or studies for paintings or frescoes. Wherever he poured out the boundless vitality of his pictorial world, whether in profane, sacred, heroic, or historical and anecdotal themes, his imaginative and original ardor of expression, his immediate spontaneity, and his easy and fluid narrative style are evident.

Closely connected with his activity as a fresco painter are the innumerable preparatory sketches that Tiepolo presented to his patrons for their approval. There are often two, three, or more preliminary sketches for a single composition, an indication of the artist's urge to perfection, his self-critical approach, more exacting than his patrons'. The preparatory sketches constitute an illuminating appendix to Tiepolo's decorative complexes, attesting the scrupulous care with which the painter studied his themes, the compositional solutions and the changes to be made.

Among the preliminary oil sketches of larger dimensions, almost paintings in their own right, is the recently discovered large canvas representing the Olympus (New York, Wrightsman Coll.), a preparatory study for the staircase fresco at Würzburg presented to Greiffenclau in April, 1752. Other oil sketches for the complex of the Kaisersaal are in Stuttgart (Staatsgal.), Boston (Gardner Mus.), and London (Nat. Gall.). Among the more remarkable smaller sketches are those for Palazzo Labia (Edinburgh, Nat. Gall. of Scotland; Stockholm, Konsthistoriska Inst., Stockholms Univ.). Sketches for secular subjects include one for the Olympus of Palazzo Clerici (Zurich, Hausammann Coll.); those for the cycle at Palazzo Archinto (PL. 58; Lisbon, Mus. Nac. de Arte Antiga; Vienna, Ak. der Bildenden Künste; Durham, Bowes Mus.; New York, Frick Coll.) and that of Villa Cordellina (Stockholm, Nationalmus.; Milan, Coll. M. Crespi; London, Dulwich College Picture Gall.); that for the fresco at Palazzo Canossa at Verona (Manchester, N.H., Currier Gall. of Art); and those for the Spanish frescoes, now in Washington (Nat. Gall.), Boston (Mus. of Fine Arts), Cambridge (Fogg Art Mus.), and New York (Met. Mus.; Wrightsman Coll.). Preliminary sketches for religious subjects include the splendid ones for the fresco of the Church of the Scalzi (Venice, Acc.; London, Rosebery Coll., where there is also a sketch for the fresco of the Church of the Pietà) and those for the vault decoration of the Church of the Gesuati (formerly Berlin, Staat. Mus., now destroyed; Milan, Coll. M. Crespi). Sketches also exist for decorations that either were never executed or have been destroyed; these are of great interest for completing the vast panorama of Tiepolo's work.

Tiepolo painted preparatory studies not only for his frescoes but also for his more important canvases. Among the most significant are the sketch (London, Nat. Gall.) for the altarpiece of Pope Clement adoring the Trinity, painted for the Convent of Schloss Nymphenburg (1734–37; now in Munich, Alte Pin.); the small canvas of the *Martyrdom of St. Sebastian* (Cleve. Mus.), a sketch for the altarpiece at the church of the convent at Diessen (1739); the sketch (1759; Amsterdam, Rijksmus.) for the altarpiece (now Dresden, Gemäldegal.) with the Presentation of the Virgin; and the moving, dramatic *St. Thecla Praying for the Plague-stricken* (1759; PL. 62), a sketch for the altarpiece at the Cathedral of Este.

The easel paintings permit a chronological study of Tiepolo's

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

stylistic development. Among the most important examples from his earliest years are *Diana and Callisto*, *Diana and Actaeon*, *Apollo and Marsyas*, and the *Rape of Europa* (Venice, Acc.), all formerly attributed to Sebastiano Ricci; the *Rape of the Sabines* at The Hermitage, Leningrad, where there is also a striking *Annunciation*, one of his earliest works, only recently identified; *Jugurtha before the Roman Consul* (Baltimore, Walters Art Gall.); and two recently discovered ovals with St. Martin of Tours and St. Blaise (Venice, Mus. Correr) flanked by two lively portraits recalling the pharmacist-donor of the Burano *Crucifixion* (S. Martino), also dating from his early years. These works testify to the artist's search for a personal style, to his innate pictorial force, and to his sharp wit, which are evident in canvases such as the *Temptation of St. Anthony* (PL. 55), the *Venus at the Mirror* (Milan, Coll. Gerli di Villagaeta), and the *Alexander and Campaspe in the Studio of Apelles* (Montreal, Mus. of Fine Arts), in which Tiepolo, with simple straightforwardness, opens the doors to the intimacy of his studio, picturing himself before his easel with his wife, Maria Cecilia Guardi, as the posing model, the blackamoor Ali, and their white Pekingese.

About 1725–30 Tiepolo completed for Ca' Dolfin, Venice, a series of ten canvases of subjects from Roman history, five of which (the *Triumph of Scipio*, *Volumnia before Coriolanus*, *Mucius Scaevola and Porsenna*, *Fabius Maximus at the Carthaginian Senate*, and *The Dictatorship Offered to Cincinnatus*) are at The Hermitage, Leningrad; two others (*Eteocles and Polyneices* and *Hannibal Contemplating the Severed Head of Hasdrubal*) are at the Kunsthistorisches Museum, Vienna; and the remaining three (the *Triumph of Marius*, the *Battle of Vercelli*, and the *Taking of Carthage*) were formerly in the Castiglione Collection, New York.

Tiepolo was influenced by Giovanni B. Piazzetta (q.v.), as is evident in works such as the *Adoration of the Christ Child* (1732; Venice, S. Marco, sacristy); *Abraham and the Angels* and *Hagar and Ishmael*, executed for the Scuola di S. Rocco, Venice; and the *Education of the Virgin* (Venice, S. Maria della Fava). But Piazzetta's influence diminished and Tiepolo reached a new stylistic balance with the altarpiece (1734) of the parish church at Rovetta (Bergamo), representing the Virgin adored by Apostles and saints. In the same year he engaged to paint the much-admired *Martyrdom of St. Agatha* for the Church of S. Antonio at Padua, completed in 1737. Tiepolo's canvases of this period reveal a tendency toward classicism, already present in the *Gathering of the Manna* (PL. 58) and the *Sacrifice of Melchizedek*, both in the parish church at Verolanuova, and more pronounced in the four canvases formerly in Villa Girola, near Como, classical also in subject: the *Birth of Venus* (Dresden, Gemäldegal.); *Danaë* (PL. 55), in which is to be found a new ideal of opulent feminine beauty; and *Juno and Luna* and *Bacchus and Ariadne* (formerly New York, Timken Coll.).

Between 1743 and 1746 Count Francesco Algarotti was in Venice, sent by Augustus III, Elector of Saxony, to buy paintings for the royal gallery at Dresden. Certainly the contact with Algarotti — man of the world, scholar, connoisseur, and *bel esprit* — must have influenced the artistic development of Tiepolo, who, already tending toward classicism, emphasized it with a cosmopolitan elegance in works painted for the Count. In 1743–44 Algarotti commissioned two paintings that he intended to give to Prime Minister Heinrich von Brühl: *Maecenas Presenting the Arts to Augustus* (Leningrad, The Hermitage) and the *Triumph of Flora* (San Francisco, M. H. De Young Memorial Mus.). At the same time Algarotti acquired for the Dresden gallery the *Banquet of Cleopatra* (1743–44; Melbourne, Nat. Gall. of Victoria). Algarotti saw in Tiepolo a second Veronese, and he found the artist fully up to his expectations in the *Rape of Europa* (1743; London, Runciman Coll.), which the Count had acquired for Augustus III — inspired by, almost a copy of, Veronese's original — and *Christ and the Magdalen in the House of the Pharisee* (1760–61; Dublin, Nat. Gall. of Ireland), copied by Tiepolo for Algarotti from the canvas by Veronese now at Turin (Gall. Sabauda). Another painting of pronounced Veronesean influence is the *Finding of Moses* (Melbourne, Nat. Gall. of Victoria), which until a short time ago was attributed to Sebastiano Ricci. Also belonging to this period is the canvas with Neptune offering Venice the riches of the sea, painted for the Palazzo Ducale, Venice.

The elegant and slightly superficial style of the secular paintings was tempered by a more profound religious sentiment in paintings such as the *Martyrdom of St. Agatha* (PL. 56) and the series of the *Passion of Christ* (comprising canvases now at Hamburg, Kunsthalle; Louvre; St. Louis, City Art Mus.), dominated by the pathos of the Christian drama, already expressed in the Passion triptych in the Church of S. Alvise, Venice (ca. 1730–40). In this triptych there are echoes of Titian and Rembrandt; and the figures, of great evocative power, illustrate the sacred themes with a strong and human realism.

During the three years Tiepolo spent in Würzburg he executed numerous works on canvas: from the series of *Rinaldo and Armida*, painted for the Residenz (now Munich, Alte Pin.) to the two large altarpieces (1752), depicting the fall of the rebel angels and the Assumption, at the Residenz chapel. A masterpiece belonging to the German period is the *Adoration of the Magi*, painted for the Benedictine Abbey at Schwarzach (1753; Munich, Alte Pin.).

Tiepolo's sojourn in Würzburg suggested not only purely decorative secular works of refined elegance and consummate bravura such as another series of *Rinaldo and Armida* painted for Palazzo Serbelloni, Venice (ca. 1755; Chicago, Art Inst.), but also religious works such as the *Finding of Moses* (Edinburgh, Nat. Gall. of Scotland). Before leaving for Spain Tiepolo executed one of his most moving examples of sacred art: the altarpiece of St. Thecla for the Cathedral of Este (1759), in which all pictorial sensuality is subordinated to a profound religious atmosphere and a deeply felt human emotion.

The number of Tiepolo's religious works dating from his stay in Spain is remarkable. After having completed the frescoes at the Royal Palace, he was commissioned to paint seven altarpieces for the Church of S. Pascual, Aranjuez, depicting St.Paschal Baylon, St. Francis of Assisi, and the Immaculate Conception (all, Prado), St. Joseph with the Christ Child (Detroit, Inst. of Arts), St. Charles Borromeo (Cincinnati, Art Mus.), St. Peter of Alcántara (Madrid, Royal Palace), and St. Anthony of Padua (Madrid, Rodríguez Banza Coll.). The hostility of Fray Joaquín de Eleta caused the seven altarpieces to be removed from the altars and replaced by canvases by Mengs, Francisco Bayeu, and Mariano Salvador de Maella. Another altarpiece belonging to the Spanish period is that with St. James of Compostela (PL. 63), painted in silvery and pearly colors. Among the religious paintings in which Tiepolo expressed himself with deep dramatic feeling are the *Annunciation* and *Abraham and the Angels* (Madrid, Villahermosa Coll.); the two canvases with the Flight into Egypt, both at Lisbon (Mus. Nac. de Arte Antiga, PL. 63; Pinto-Basto Coll.), which herald Goya in their tragic quality; and the *Entombment* (Lisbon, Pinto-Basto Coll.), pervaded with mystical resignation. Tiepolo must inevitably have felt the influence of the severe Catholic environment in Spain, for in the canvases of this period there is an unusual renunciation of spectacular elements. But it is equally true that he greatly influenced Spanish neoclassical painters and especially Goya (q.v.), whose tumultuous spirit must have well understood the innate pictorial vitality and the coloristic sensuality of the Venetian master.

Tiepolo's activity as a portraitist deserves mention, although few of the portraits painted by him survive. From the first, Tiepolo revealed a perceptive skill in character portrayal, as can be observed from his numerous self-portraits, beginning with those of the Udinese period. V. da Canal (1732) recorded that Tiepolo executed several portraits in Ca' Cornaro, Venice, today unfortunately lost but probably not very different from the portrait of the pharmacist-donor represented in the *Crucifixion* at Burano. So absorbed was the painter in his large decorative tasks, however, that he gave little time to portraiture, and the only known examples on canvas are the half-figure of Antonio Riccobono (Rovigo, Pin. dell'Acc. dei Concordi) and the portrait of the procurator Giovanni Querini (Venice, Gall. Querini Stampalia), the first imaginary and vigorous, the second, from life, an unequaled example of the painter's subtly humorous

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

psychological penetration. In addition there are two enchanting female portraits: an early one representing a peasant girl with a basket of fruit and flowers (ca. 1720–25; Zurich, private coll.) and another of a young woman playing the mandolin (ca. 1755–60; Detroit, Inst. of Arts). Despite their slightly idealized character, paintings such as the *Euterpe* (Barcelona, Mus. de Arte de Cataluña) and the *Young Woman with a Macaw* (Oxford, Ashmolean Mus.), once a companion piece to the *Young Woman with a Fur* (location unknown), should also be regarded as portraits. In fact, portraiture, considered as a human and finely satirical record, is evident in all Tiepolo's frescoes. From the youthful frescoes at Udine and those in Villa Contarini (a true collection of contemporary manners) to the unforgettable examples at Würzburg and those at Villa Pisani, there are self-portraits and portraits of well-known figures, patrons, and friends. Also related to the artist's predilection for character portrayal are his numerous *têtes de caractère*, of evident Rembrandtian inspiration, generally represented with heavy beards and robed in Oriental fashion wearing turbans, gold chains, or jewels.

An immensely rich collection of drawings parallels Tiepolo's activity as a painter: every principal step of his career is documented by sketches or preparatory studies, in sanguine, in charcoal, in pen, or in sepia wash (PL. 64). Although more than a thousand sheets of drawings and sketches are extant, they are probably only a part of the actual production of this dynamic artist. The most important groups of drawings by Tiepolo, who as a draftsman is on the level of Tintoretto, Rubens, and Rembrandt, are to be found in Trieste (Mus. Civ. di Storia ed Arte), in Florence (Fondazione Horne; Uffizi), in Bassano del Grappa (Mus. Civ.), in London (Vict. and Alb.), in New York (Met. Mus.; Pierpont Morgan Lib.), and in Vienna (Albertina).

A chronological study of Tiepolo's graphic work reveals the artist's search for a style. His early drawings show his concern for anatomy, drawn with a bold sureness of rippling line that gives an immediate measure of his "Tintorettesque" potentiality. Toward 1730 one sees the beginning of a firmer and more decisive line and a new manner of shading from the half-tones to the denser shadows. These innovations are particularly apparent in the group of sketches for the frescoes of Villa Loschi at Biron (1734). Shortly after 1740 the artist adopted a new style of pen drawing that was more rapid and summary, aimed at capturing the essence of the principal forms and movements. The most interesting of this type are the studies for Villa Valmarana (1757), which seem to fix the flashing visions of the artist's fantasy with bare suggestions of lines and chiaroscuro in lightning strokes — a type of figural shorthand that Tiepolo retained until his last works. Often Tiepolo's drawings were inspired simply by the wish to fix the play of light, movement, or various aspects of nature, as, for instance, in his "rural" works, which vibrate with a sincere love and deep feeling for landscape, or in his numerous caricatures, in which the comic side of humanity is laid bare with a good-natured Goldonian spirit.

Tiepolo left an indelible mark as an engraver, rendering sunshine and magical lighting effects with unmatched skill. His light, rapid touch gives a sort of luminous vibration to the composition (IV, PL. 437). He was doubtless familiar with Rembrandt's engravings, but he replaced their dramatic somberness with a joyous effect of light. Among the most significant examples by the Venetian master are the spirited and fantastic *Capriccii* (V, PL. 241), certainly conceived before 1740 and published by A. M. Zanetti in 1749, and the later *Scherzi di Fantasia*, surprising for their whimsical character.

Tiepolo was not an artist misunderstood by his own time; on the contrary, he expressed the ideals of the 18th century with such liveliness, force, and fantasy that all Europe, with the possible exception of France, saw him as the leading painter of his day. In his youth he was a revolutionary painter, rebelling against the baroque stereotypes of official art (as represented by Onofrio Loth, G. A. Fumiani, Nicolò Bambini, and Antonio Zanchi) and joining innovators such as Piazzetta, Ricci, and Federico Bencovich. He was absolute master of the whole range of his art, bringing fresco painting back to the artistic level of Giorgione, Titian, and Veronese; by 1720–30 he had surpassed anything being produced in Italy, from G. M. Crespi to Piazzetta, from Alessandro Magnasco to Ricci, from Francesco Solimena to Corrado Giaquinto. One of the chief reasons for his success was certainly the way he used his colors: in the first place, giving the figures bright and lively colors in close juxtaposition with cool colors to impart to them a joyous vitality; and in the second, achieving in his compositions an exact balance of tones to create a perfect harmonization of the figures in perspective so that they are absorbed into the atmospheric distance. It has been said that Tiepolo introduced in painting a sun that had never before been seen; certainly, with him began the conquest of light and atmosphere in which only the names of Canaletto and Guardi rank beside his and which determined the pictorial current that was to be a forerunner of the modern plein-air school of impressionism.

Yet his own contemporaries who had followed his success with such admiration tired of the intense and insistent rhythm of his work. Neoclassicism, fatally declining into academic dogmatism and no longer understanding the elements of the imaginative world of baroque art, relegated Tiepolo's work to obscurity. Only toward the end of the 19th century did a keen interest in the art of the master arise after a few painters, including Delacroix, had recognized his virtuosity and, later, the impressionists had begun to admire his clarity and ethereal transparency. The reappraisal of Tiepolo's art coincided with the critical reexamination of the baroque, due in particular to Alois Riegl and Max Dvořák, which introduced into the field of art history the weight of a new historical and scientific objectivity in relation to this period and to its artistic expression.

The question remains whether Tiepolo was in fact a baroque artist. Although undoubtedly baroque at first, he later reached a level of such balance, measure, and rare luministic expression that he transcends this classification, just as he transcends the classification of "classical," since his was a personal and subjective classicism that escapes any precise definition. Because he was not neoclassical, it is understandable that the neoclassicists, the theorists, and the academic painters of the late 18th and the 19th century were unable to understand the art of the great Venetian. However, his revaluation, once begun, was rapid and decisive. The first noteworthy monograph on Tiepolo, written by F. H. Meissner, appeared in 1897; in 1898 came H. de Chennevières's, in 1902 H. Modern's, P. Molmenti's monumental work in 1909, and the well-documented volume by E. Sack in 1910 — these last two marking a great step forward in the study of Tiepolo. Studies of the artist have grown progressively more numerous, clarifying points such as the dating of the frescoes at Villa Valmarana and the various aspects of his earliest works and finally distinguishing between the works of Giovanni Battista and those of his son Giovanni Domenico.

GIOVANNI DOMENICO. Son and chief collaborator of Giovanni Battista, born Aug. 30, 1727, in Venice, where he died Mar. 3, 1804.

Although Giovanni Domenico profited much from his close association with his father, he was handicapped by the weight of the latter's fame. It is not in the works reflecting Giovanni Battista's style, however, that Giovanni Domenico displayed his special talent, which was directed toward genre painting in the form of small anecdotal or satirical paintings of everyday Venetian life, observed with a fresh and acute humor. Undoubtedly a precocious artist, at the age of twenty he was commissioned to paint the 14 Stations of the Cross (1747–49) for the Oratory of the Crucifix in the Church of S. Polo, Venice. For the same Oratory he executed two ceiling canvases and seven religious paintings, some of which are now lost. Despite the limitations of these beginnings, his pictorial idiom, while remaining faithful to his father's forms, is nevertheless punctuated here and there by a strongly personal tendency toward the episodic and picturesque, revealing a lively narrative vein.

In 1748 Giovanni Domenico was working on the fresco with St. Francis curing a possessed man, for the Church of S. Francesco di Paola, Venice, and the following year he was

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

summoned to fresco the chapel of Villa Duodo, Zianigo, with episodes from the life of S. Girolamo Emiliani (Miani). In this villa, later acquired by the Tiepolo family, he was on various occasions to express his artistic soul in the most genuine way, improvising a pictorial world of clowns, laughing punchinellos, and creatures springing from an imagination too long constrained. Also from this period is the *Consilium in Arena* (Udine, Mus. Civ.). The commission for this celebrative painting had been entrusted to Giovanni Battista in 1749 by Count Antonio de Montegnacco, but, judging from the style, it is probable that Giovanni Domenico, under his father's supervision, was responsible for its execution. The two canvases (New York, private coll.) depicting the Infanta of Spain at Parma, perhaps only slightly later in date, are undoubtedly by Giovanni Domenico (one of them bears his signature), although they, too, were commissioned from Giovanni Battista. Before the Tiepolos' trip to Würzburg, Giovanni Domenico painted for the parish church of Merlengo, near Treviso, the altarpiece depicting St. Oswald. Faithful hitherto to his father's formulas, his style here gives indications of those personal characteristics that were to take form in the following years, especially the pungent realism that constitutes the principal element of his artistic individuality.

During his stay at Würzburg (1750–53) Giovanni Domenico for the first time worked at his father's side on a decorative cycle of considerable importance; his collaboration is evident throughout the less important parts of the frescoes. Commissions were also given him independently, such as the overdoors for the Residenz, representing Justinian as lawgiver, St. Ambrose, and the emperors Theodosius and Constantine, all dating from 1751, which are overshadowed by his father's frescoes. In 1752 he painted four other overdoors for Von Greiffenclau for the castle of Veitshöchheim, two of which are perhaps the *Christ and the Magdalen* and the *Last Supper*, signed and dated in that year (Munich, Alte Pin.). During this period Giovanni Domenico also executed other religious paintings of Biblical subjects, among them *Christ and the Adulteress* (1751; New York, Harrison Williams Coll.), *Rebecca* (Paris, private coll.), another *Christ and the Adulteress* (1752) in a French private collection, *Christ Healing the Blind Man* (1752; Hartford, Wadsworth Atheneum), and the *Institution of the Eucharist* (1753; Copenhagen, Statens Mus. for Kunst). Giovanni Domenico's style, although technically more sinewy and animated, is so similar to his father's in these Veronese-like compositions that many canvases of this religious series were for a considerable time regarded as masterpieces of Giovanni Battista. Thus the canvas depicting the miracle of the pool at Bethesda (Philadelphia, Mus. of Art), the *Christ and the Adulteress* (Paris, private coll.), and two other canvases of these same subjects (private coll., bequeathed to Louvre subject to usufruct) were for a long time admired as among the most beautiful of Giovanni Battista's works. Also dating from the Würzburg period are the *Alexander and the Daughters of Darius* (Detroit, Inst. of Arts), to which *The Magnanimity of Scipio* (Frankfurt am Main, Städelsches Kunstinst.) is a companion piece.

Also to be included in the group of works of the German period are paintings such as the *Birth of the Virgin*, the *Presentation in the Temple*, and the two scenes with Abraham and Lot (Rome, Coll. L. Albertini) as well as the *Adoration of the Shepherds* and another *Presentation in the Temple* (Stockholm, Konsthistoriska Inst., Stockholms Univ.). Critics still attribute these sometimes to Giovanni Battista and sometimes to Giovanni Domenico. But they were undoubtedly executed by the latter during his stay at Würzburg, and they are testimonials to his narrative power, expressed in a spontaneous vein almost free of his father's influence. Such works as these, in fact, are the very ones that afford a fuller understanding of Giovanni Domenico's power, foretelling the artist who was to paint the frescoes at Villa Valmarana.

In fresco decorations, which patrons commissioned mostly to obtain "copies" of his father's celebrated creations, Giovanni Domenico imitated his father. Thus, on his return from Würzburg, he frescoed (1754–55), with the help of the perspectivist Mingozzi and making use of portions taken whole from his father's works, the presbytery and dome of SS. Faustino e Giovita, Brescia, with scenes from the lives of the two titular saints. (Some of the studies for these Brescian frescoes are by Giovanni Battista, which suggests that he may originally have been commissioned to do them.) Giovanni Domenico's style is freer in the frescoes of the presbytery, with those delicate and sensitive forms already developed in the moving engravings of the Flight into Egypt (PL. 64).

In 1756 Giovanni Domenico was elected, together with 36 other painters, to constitute the Accademia di Belle Arti of Venice. The following year he was again working with his father on another very important fresco cycle: that of Villa Valmarana, where he was able, however, to express his own bent for genre painting, since they were working in different rooms. The two carnival scenes in the "Foresteria" of the villa, signed by Giovanni Domenico, provide the key to the recognition of his work in the other rooms. He was responsible for the exotic scenes in the Sala Cinese, the Arcadian visions of the Sala delle Scene Campestri, the bizarre and slightly affected compositions of the Sala Gotica (PL. 66), the vivacious figures of the Stanza della Loggia, and the joyous putti in the medallions of the Sala dei Putti: altogether a lively figural world, depicted with inventiveness and ingenuity, far removed in character from the classical heroes that Giovanni Battista was idealizing in the same villa.

The proper attribution of such an important pictorial complex to Giovanni Domenico — on both stylistic and documentary grounds, especially on the correct reading of the date, previously interpreted as 1737 and therefore excluding his collaboration — raises the possibility of including in Giovanni Domenico's *œuvre* a controversial group of lively carnival pictures. For the *Minuet* (VI, PL. 76) and the *Charlatan* (Louvre) a reading of Giovanni Battista's initialed signature and a date of 1754 had been sustained, for the *Ballet* and the *Charlatan* (both, Barcelona, Mus. de Arte de Cataluña) a date of 1756. The dates (no longer visible) may be acceptable from a stylistic point of view; but the initials (if indeed they ever existed; they are no longer visible) may well have been altered with the intention of increasing the value of the paintings. In fact, if stylistic analysis is insufficient to establish their correspondence to the Valmarana frescoes definitively by Giovanni Domenico, further evidence is provided by comparison with the four well-known later canvases of this series: the *Charlatan*, the *Tooth Puller*, the *Triumph of Punchinello*, and the *Ballad Singer* (1765?; Rome, private coll.). The last-mentioned was engraved by Joseph Wagner in 1771 with Giovanni Domenico's name; the *New World* (Madrid, Balboa Coll.) was engraved in 1777 with the inscription "Jo. Dominicus Tiepolo pinx." It may be added that the delightful *Departure of the Gondola* (New York, Wrightsman Coll.) is signed in full, and *The Burchiello* (PL. 63), which provides a poetic glimpse of 18th-century Venice, is clearly signed with his initials. Among Giovanni Domenico's lively narrative paintings should also be mentioned the *Encampment of Gypsies* (Mainz, Altertumsmus.) and the *Minuet* (New York, Wrightsman Coll.).

In 1758 the artist painted the apse of the parish church of Meolo with monochrome frescoes (Baptism of Christ) similar in style to the eight monochrome frescoes painted on the walls of the Church of the Purità, Udine, the vault of which Giovanni Battista decorated with the Assumption. The frescoes at Udine constitute a turning point in Giovanni Domenico's stylistic development, insofar as he adopted certain almost neoclassical attitudes that were developed in his later works. Giovanni Domenico's collaboration in the monochrome decorations that formed part of his father's fresco cycles began as early as 1754, when he executed a large part of the monochromes of mythological subjects at Nervesa (Berlin, Staat. Mus.). The Metropolitan Museum of New York has a series of monochromes, partly by Giovanni Domenico, that supposedly come from a villa on the Brenta River frescoed by Giovanni Battista. Other instances of similar collaboration between the two artists are the six monochromes painted for Palazzo Porto (now Biego), Vicenza (Stockholm, Nationalmus.), and those for Palazzo Trento-Valmarana, Vicenza.

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

Giovanni Domenico's partnership with his father was intensified before their departure for Spain, in the decorations of Palazzo Canossa, Verona, and of Villa Pisani, Strà, where he assisted with the grisailles; these, designed almost as bas-reliefs, are neoclassical in conception, confirming this trend in the painter's style. (Related to these, although of a later date, are the two monochromes of Cicero and Demosthenes, executed by Giovanni Domenico for the Palazzo Ducale, Venice, in 1775.) The son must have worked with his father also in 1761 on the commissions for the Scuola di S. Giovanni Evangelista, Venice, the contract for which dates from September, 1760. However, Giovanni Domenico was solely responsible for the paintings of the Immaculate Conception and St. Michael the Archangel, as Giovanni Battista had to give up the commission for lack of time.

In April, 1762, Giovanni Domenico accompanied his father to Madrid, where he was active both as his assistant and independently. Among his most important commissions was the ceiling fresco for the Saleta of the Royal Palace, a celebration of the Glory of the Spanish Monarchy (XII, PL. 179), almost completely dependent on Giovanni Battista (who was concurrently painting the same subject on the ceiling of the Queen's Antechamber) for the composition but differing entirely in its use of chalky-gray tones. In Spain Giovanni Domenico was also commissioned to paint the Stations of the Cross for the Church of S. Felipe Neri, Madrid. The eight extant paintings, now at the Prado, reveal a rather engorged design, a certain pictorial flatness, and a decline in quality compared with his earlier works, repeating but not improving those concepts of frontality and overcrowding of the foreground typical of his early years. The last painting bears the date 1772, which indicates that Giovanni Domenico completed it after his return to Venice.

Giovanni Domenico's close association with his father during the sojourn in Spain enabled him to absorb his father's final stylistic legacy: those intimate expressions of deep feeling, the restless and jagged line, and the silvery atmosphere that characterize Giovanni Battista's last works. Their influence is evident in the small canvases with scenes from the life of Christ (various private collections) persistently attributed to Giovanni Battista but undoubtedly by Giovanni Domenico, which include genuine little masterpieces such as the *Christ Calming the Tempest* (Paris, Fodor Coll.). Giovanni Domenico also assisted his father in the ceiling paintings commissioned by the Russian court. The titles of the four canvases, executed in Spain, are known from the engravings made after them by Giovanni Domenico himself: *Mars with the Three Graces, The Chariot of Venus with the Graces, The Magnificence of the Princes,* and *The Triumph of Hercules.* The last, according to the inscription of the engraving, was entirely "invented" and painted by Giovanni Domenico, who also made a preparatory study in oils (Lugano, Thyssen-Bornemisza Coll.).

After his return to Italy in 1770 Giovanni Domenico's line became still more delicate and fragile, creating a "liquid" composition, as in *The Preaching of John the Baptist* (Treviso, Mus. Civ.) and *The Baptism of Christ* (Florence, Mus. Stibbert), in which the atmosphere becomes increasingly silvery, achieving an almost monochrome bluish tonality and making his paintings more and more like drawings. He was elected as a master to the Venetian Academy in 1772. In 1773 he executed the *Abraham and the Angels* (Venice, Acc.), and in 1777 the altarpiece of the Holy Family with St. Francesca Romana and St. Eurosia for the Church of S. Agnese, Padua. In 1778 the *Institution of the Eucharist* was listed as a diploma work by the painter at the Academy, of which he was named president in 1780, as his father had been before him.

Giovanni Domenico completed, in 1783–84, the decoration of the ceiling of the Church of S. Lio, Venice, with the *Glory of Pope Leo IX* (oil sketch, Vict. and Alb.). In August, 1782, he entered a competition for the painting of a fresco in the Sala del Gran Consiglio of the Palazzo Ducale, Genoa. His sketch (Met. Mus.) won third place, and in 1784 he was commissioned to execute the fresco. The work, later destroyed, representing the Apotheosis of Jacopo Giustiniani, was unveiled to the public on Nov. 14, 1785; it revealed anew that Giovanni Domenico, however different his work, was heir to his father's artistic glory, a fact that never failed to influence his patrons. In 1789 he was again in Venice and active at Palazzo Contarini dal Zaffo, where he frescoed an allegorical ceiling and lively decorations and monochromes. This is the last known official work by Giovanni Domenico, who led an increasingly retired life in his villa at Zianigo, which he decorated with frescoes variously dated between 1749 and 1793 but belonging, for the most part, to his last years; these frescoes depict scenes of Venetian life and groups of punchinellos, satyrs, and centaurs painted in an unconventional style.

Giovanni Domenico was prolific in the production of drawings, particularly in his last period. The subjects are varied: animal studies connected with the decorations at Zianigo, crowded groups of satyrs and fauns, religious themes, sketches for fresco compositions, and historical scenes, from an almost inexhaustible repertory. Special mention should be made of the fantastic drawings illustrating the life and death of Punchinello, which, with their frank and earthy allusions to the decadent manners of Venice at the turn of the century, form a curious chapter of his *Divertimenti.* Still more pungent are his satirical drawings, the corrosive documentation of a society in decline, comparable to the drawings of William Hogarth or Thomas Rowlandson: caricatures of sharp wit (to which Goya was certainly not indifferent) that recorded caustically the signs of political and moral corruption presaging the imminent close of an epoch.

Giovanni Domenico was also a noteworthy engraver from his earliest years, when he engraved (1749) the 14 Stations of the Cross that he had painted for the Church of S. Polo. On leaving Würzburg in 1753 he presented Greiffenclau with a series of etchings on the theme of the Flight into Egypt (PL. 64), which, besides constituting a novelty in the field of Italian engraving, are characterized by a precise and refined technique that is distinguished from that of Giovanni Battista by its more accentuated touch, interpreting the forms with a continuous undulating line and producing striking effects of light, space, and atmosphere. Giovanni Domenico also engraved, after the death of his father, the famous *Raccolta di Teste* from the "character heads" painted by Giovanni Battista and himself, forming two volumes of 30 etchings each, dedicated to Alvise Tiepolo. In 1775, a few years after the sojourn in Spain, the artist published, in a volume dedicated to Pope Pius VI, the *Catalogo di Varie Opere inventate dal Celebre pittore Gio. Batta Tiepolo,* engraved partly by his father, partly by himself, and partly by his brother Lorenzo. Thus many of Giovanni Battista's works were given new life and ideally brought together by the devotion of his son, who immortalized them in engravings.

The appreciation of Giovanni Domenico's true artistic personality, apart from that of his father, is the result of research in recent decades. At one time his works were confused with those of Giovanni Battista and believed to be distinguishable only by a difference in quality. Now, however, since the recognition (Morassi, 1941) of his works at Villa Valmarana, it is possible to discern in him an artistic sense and tendencies different from his father's, a spirit not courtly, classical, and aristocratic but, rather, familiar, preromantic, and already directed toward an enlightenment foreshadowing the 19th century. It is in fact Giovanni Domenico, perhaps more than his father, who anticipates certain aspects of Goya's art. Qualitatively, the son's works are often of the same caliber as those of his father, even though, regarded as a whole, Giovanni Domenico did not achieve the greatness of Giovanni Battista, without whose influence the works of Giovanni Domenico would be unthinkable.

LORENZO BALDISSERA. Son of Giovanni Battista and brother of Giovanni Domenico (b. Venice, Aug. 8, 1736; d. Madrid, August, 1776).

Little is known of Lorenzo; he was trained in the shadow of the fame of his father and brother. In November, 1750, he, too, traveled to Würzburg and remained there until 1753. His name appears in the register of the painters' guild in 1761, and a year later he was in Madrid, where he remained after

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

the death of his father and the departure of his brother, living, it appears, in straitened circumstances. In 1768 and again in 1773 he applied without success for nomination to the post of *pintor de camera*; in 1774 he was tried for having demanded the refund of expenses, held to be nonexistent, for pastels executed for the royal family. In 1773 he was admitted as an honorary member by the Venetian Academy, more on account of his father's merits than his own.

His activity as a painter, even now not very clear, is chiefly based on comparisons with his only certain work, dated 1757 and signed "Lorenzo Tiepolo. filio": the portrait of a lady with a fan (Venice, Ca' Rezzonico), representing, according to some scholars, his mother, Maria Cecilia Guardi. It is a pastel executed with a certain refinement and indicates an acquaintance with the work of Rosalba Carriera. From the first, Lorenzo showed a predilection for pastels. In 1756, three years after leaving Würzburg, he sent a "piccola opera di pastello" to the prince-bishop, Adam Friedrich von Seinsheim; but it is probable that, during his stay in the capital of Franconia, he had already tried his hand in this field, since there is sufficient evidence to attribute to him two portraits, one of the sculptor Auwera and the other of Auwera's wife, Christine (Würzburg, Mainfränkisches Mus.), which may be considered among his first artistic efforts. On the basis of comparison with the Ca' Rezzonico pastel, the canvas of the Tiepolo family (London, Rosebery Coll.) has also been attributed to Lorenzo. It is delicate but incisive in style and probably dates from shortly before his departure for Spain, being left incomplete (a preparatory drawing for the figure of the pastellist is in a private collection in Milan). To this work may be related the pastel portrait of a man with a dog (formerly Milan, Coll. Crespi-Morbio) and two pastels (El Paso, Mus. of Art), one of a lady with a parrot and the other of a lady with a fur, both copied from compositions by his father and still sometimes attributed to him.

The Spanish environment must have exerted a decisive influence on the development of Lorenzo's art, which seems to have acquired a mannerist bent, probably from the example of Mengs and his followers. To this period may be assigned with certainty the pastel of the Virgin, St. Joseph, and the Christ Child holding a goldfinch (Barcelona, private coll.), iconographically derived from prototypes by Giovanni Battista, as well as the beautiful pastels (Prado) of a Levantine with turban and collar and of a bearded man wearing a shoulder sash, characterized by bold lines and strong shadows, reminiscent of his father's series of exotic heads. Similar is the group of twelve pastels of half-figures (Madrid, Royal Palace), in which Lorenzo depicts with remarkable expressive force realistic scenes of the life and customs of the Spanish people. All trace has been lost of 15 pastel portraits of the royal family and other pastels of religious subjects recorded in documents. Among other works attributed to Lorenzo, M. Goering (ThB) lists seven pastel scenes of daily life (Madrid, Condesa de Alcubierre Coll.) similar to those mentioned above. The theory, held even in recent studies, that Lorenzo frescoed a ceiling in the Royal Palace during his stay in Madrid stems from the statement made by J. A. Ceán Bermúdez (*Diccionario . . .*, v, Madrid, 1800) confusing Lorenzo with Giovanni Domenico in connection with the fresco of the *Triumph of the Spanish Monarchy* that the latter painted in the Saleta of the Royal Palace.

Noteworthy among Lorenzo's drawings are the two heads (one of a woman wearing a turban and the other of an old Oriental with a beard), both signed and certainly very early works, and the signed *Capriccio* showing a woman, a child, and a satyr beside an obelisk (all, Würzburg, Mus. der Univ.). Also by him is a group of heads mostly in charcoal, including the signed *Head of a Young Man* (New Haven, Yale Univ. Art Gall.), the *Head of an Old Woman* (New York, Janos Scholz Coll.), and several others in the Musei Civici, Pavia. Among the drawings attributed to him is a group in the Museum Boymans-Van Beuningen, Rotterdam. One of his best-known drawings is the portrait of Goldoni (PL. 64), engraved by Marco Pitteri for the 1761 edition of the *Comedies*, published by G. Pasquali. Pitteri also did an engraving of the portrait of the procurator Tommaso Querini drawn by Lorenzo (in 1760, according to P. Gradenigo) after a painting by Fortunato Pasquetti (1700–73?).

Nine of Lorenzo's engravings are known, all after works of his father; these were incorporated in the *Catalogo* published by Giovanni Domenico on his return from Spain in 1775. The technique of the youngest Tiepolo, although similar on the whole to that of his father and his brother, differs in its more emphatic, almost metallic line and in its more accentuated chiaroscuro, obtained by the use of a long, thick stroke, often cross-hatched.

Unlike Giovanni Domenico, whose artistic stature holds its own beside that of his father, Lorenzo remains, on the basis of present knowledge, a secondary and rather unimportant artist.

TIMURID ART. By Timurid art is meant the art that flowered not only in Transoxiana and eastern Persia under Tīmūr Lenk — the celebrated Tamerlane (1335–1405) — and his descendants but also simultaneously in western Persia (see IRAN) under the Turkoman dynasties of the Qara Qoyūnlū and the Āq Qoyūnlū. The school of Herat, which marks the highest peak of this civilization (particularly in regard to painting), was to have a profound influence on the art of Moghul India (see ISLAM; MOGHUL SCHOOL).

SUMMARY. Historical background (col. 97). Architecture (col. 98). Painting (col. 101): *The style of Shiraz; The Turkoman style; The style of Herat.* Calligraphy and bookbinding (col. 104). Decorative arts (col. 105): *Ceramics; Metalwork; Wood carving and stonework; Carpets.*

The Timurid empire in the second half of the 14th century. *Key*: (1) Limit of Tīmūr Lenk's conquests; (2) borders of neighboring states; (3) places with important remains of Timurid structures.

HISTORICAL BACKGROUND. After he had overrun and devastated Persia, southern Russia, northwestern India, Syria, Iraq, and Anatolia, Tīmūr Lenk set out on a great expedition against China, but died at Otrar (Utrar) in 1405 and was buried in splendor at Samarkand, the capital of his dominions. The real Timurid period begins in the reign of Shah Rukh, Tīmūr Lenk's son, who quickly succeeded in reuniting the greater part of the territories in Persia that had been divided on his father's death. Shah Rukh made his three sons viceroys of his empire: Ulugh-Beg in Central Asia (Samarkand), Bāysunghur Mīrzā in Khorasan (Herat), Sultan Ibrāhīm in Fars (Shiraz). After the death of Shah Rukh in 1447 Timurid power soon began to decline as a result of dynastic struggles and continual fighting with the Turkomans and the Uzbeks. This decline did not, however, prevent the arts from flourishing, especially at Samarkand and Herat. At the court of Sultan Ḥusayn Bāyqarā, who reigned at Herat from 1468 to 1506, were men like Mīr 'Alī Shīr Nawā'ī, considered the founder of eastern Turkic literature, the Persian poet Jāmī, the historians Mīrkhwānd and Khwāndamīr, and the greatest painters of the period — Bihzād, Shāh Muẓaffar, Qāsim 'Alī, Mīrak Naqqāsh, and 'Abd-ar-Razzāq, to name only the most important. Badī' al-Zamān, son of Ḥusayn Bāyqarā and last of the Timurid sultans of Herat, was defeated and dethroned by Shaybānī Khan the Uzbek in 1507. After finding refuge at the court of Shah Ismā'īl Ṣafavī at Tabriz, he fell into the hands of the Ottoman Turks and died in Istanbul in 1517.

With the Timurids began one of the most flourishing periods of Islamic civilization. Under their reign architecture achieved a splendor unprecedented both in its monumentality and in the richness of its decoration (see CERAMICS; ISLAM), while painting reached such a degree of perfection that it served as a model for all the subsequent schools of painting in Persia (see MINIATURES AND ILLUMINATION). This was also a time of great development and exquisite production in the decorative arts — textiles (see TEXTILES, EMBROIDERY, AND LACE), in particular carpets (see TAPESTRY AND CARPETS); ceramics (q.v.); jewelry (see GOLD- AND SILVERWORK); metalwork; woodwork; and carved stonework. The origin of Moghul art in India can also be traced to the Timurids, as Bābur, first Moghul emperor, was a lineal descendant of Tīmūr Lenk.

ARCHITECTURE. Timurid architecture owes much to that of the preceding period, particularly that of Mongol Persia (see ILKHAN ART): in fact many architects and craftsmen who worked on the construction and decoration of the buildings erected by Tīmūr Lenk and Shah Rukh in Central Asia had been brought from Persia. A large part of this architecture has disappeared, but the buildings that remain and the descriptions of contemporaneous historians and travelers make it possible to form a fairly exact picture of it.

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

The oldest monuments are in Central Asia, and of these the most important group, which reveals all the possibilities of Timurid architecture and simultaneously its links with the past, comprises the tombs in the Shāh-i-Zind ("living king") necropolis at Samarkand (PLS. 69, 70). This necropolis, built around the tomb (1334/1335) of Qāsim ibn-'Abbās, who was revered as the "living king," consists of 16 buildings, the last of which was erected in 1405. In 1434 Ulugh-Beg added a monumental gate. Samarkand preserves other important buildings of the early Timurid period: the Ishrat Khan, erected by Tīmūr Lenk in 1395; the Bībī Khānum Madrasah (named after one of Tīmūr's wives), 1398–1405; the Gūr-i-Mīr (Mausoleum of Tīmūr Lenk and his family; PL. 68; FIG. 99), completed in 1405, with the addition, in 1434, of a portal designed by Muḥammad al-Iṣfahānī, who according to Mayer (1956) was the architect of the whole mausoleum; and the great Madrasah of Ulugh-Beg, 1417–20 (PL. 68). In Bukhara there remain the Mausoleum of Bayān Kūlī Khan (1357/1358) and the Kalyān Mosque,

Timurid funerary structures. (*a*) Samarkand, Gūr-i-Mīr, plan of the original tomb (*from SPA, II, fig. 410*); (*b*) Herat, Mausoleum of Gauhar Shād, plan (*ibid., fig. 407*).

rebuilt by Tīmūr Lenk; in the town of Turkestan, the Mosque of Aḥmad Yasavī, built in 1394/1395 to the design of Ḥājjī Ḥusayn Shīrāzī; at Kesh (mod. Shahr-i-Sabz), the monumental entrance of the Aq Saray, a palace that had been building for twenty years when Clavijo visited it in 1404; and at Anau, the Mosque of Abū'l-Qāsim Bābur ibn-Bāysunghur, dating from 1445.

Important buildings are also to be found in Afghanistan (q.v.): at Balkh, the Shrine of Khwāja Abū-Naṣr Pārsā (VIII, PL. 163); at Herat, the Mausoleum of Gauhar Shād, wife of Shah Rukh (FIG. 99), built about 1430 as part of the Muṣallā (FIG. 101) that was constructed for her (1417–37) by Qavām ad-Dīn Shīrāzī and pulled down in 1885 except for the minarets; also at Herat, the Sanctuary of Khwāja 'Abdullāh Anṣārī, restored and embellished by Shah Rukh in 1428; at Mazar-i-Sharif, the sanctuary called Ḥażrat 'Alī, rebuilt in 1481 by Ḥusayn Bāyqarā around the tomb of 'Alī, the fourth caliph. In Persia (see IRAN) very little has remained of Timurid architecture. The Masjid-i-Jāmi' in Yezd (Yazd) has a mihrab dated 1375; the building was decorated with faïence mosaics, the work on which continued until the middle of the 15th century, the decoration of the southern liwan dating from 1442. It is probably the best preserved of the early Timurid buildings, although the decoration of the entrance has been largely reconstructed. The most important Timurid building in Persia is without doubt the Mosque of Gauhar Shād at Meshed (Mashhad; FIG. 101), erected in 1418 close by the sanctuary of Imam 'Alī al-Riżā.

The most notable achievements of the period were the Muṣallā (which included the Madrasah and the Mausoleum) of Gauhar Shād at Herat and the Blue Mosque (Masjid-i-Kabūd; PL. 67, FIG. 101) at Tabriz, built in 1465 by Jahan Shāh, ruler of the Qara Qoyūnlū Turkomans; there is no proof that the architect of the Masjid-i-Shāh at Meshed was also responsible for this building.

From the structural point of view, few innovations were made during the Timurid period. The mosques were constructed on the old Seljuk plan (see SELJUK ART): a rectangular *ṣaḥn* (court) with four liwans, a domed hall behind the principal liwan (on the side of the *qibla*), and minarets at the portal, at the principal liwan, and sometimes at the four corners of the building. This was the plan of the great Mosque of Tīmūr Lenk at Samarkand — known only from the descriptions of contemporaneous authors such as Sharaf ad-Dīn 'Alī Yazdī — and also of the Kalyān Mosque at Bukhara and of Gauhar Shād's at Meshed, of the Bībī Khānum Madrasah at Samarkand, and of the Muṣallā at Herat; probably the Masjid-i-Jāmi' at Yezd had the same plan. A similar design was adopted for madrasahs such as the one at Kharjird.

Toward the end of the 14th century and in the first half of the 15th, mosques built on a central plan became increasingly popular; they lacked a *ṣaḥn* but were provided with a monumental entrance and a high but shallow liwan, flanked by massive minarets and leading directly into the domed hall. The mausoleum-mosques of Samarkand (Madrasah of Ulugh-Beg), Turkestan (Aḥmad Yasavī), Kesh (Ulugh-Beg), and Anau (Abu'l-Qāsim Bābur) were constructed on the same plan. The Blue Mosque in Tabriz has a similar plan, although its Byzantine characteristics make it an almost unique building, with eight domed rooms around the central hall (PL. 67, FIG. 101). The entrance and reception halls in Tīmūr Lenk's palaces at Samarkand (Ishrat Khan) and Kesh (Aq Saray) were also built on the same principle: a huge liwan, flanked by massive minarets (in the Aq Saray still standing to a height of 140 ft.), opened into a hall covered by a monumental dome. Besides these rooms, there were adjacent chambers and vast courtyards with fountains and with rooms around them for the sovereign's retinue.

The type of mausoleum that evolved at Samarkand follows a simple and unvarying plan: a square room covered by a low dome. The passage area is bordered by large niches with pointed arches: the niches in the center of the wall descend to the ground, and those in the corners are decorated with elaborate stalactite work (*muqarnas*). Seen from the exterior, the dome, which is pointed, rises above a high drum and bulges beyond it. This bulbous dome, often ribbed — fully developed for the first time in the dome of the inner sanctuary of the Mosque of Aḥmad Yasavī at Turkestan (1394/1395) — even though it derives from an ancient tradition, represents something new in Persia and Central Asia and is one of the most distinctive features of Timurid architecture.

The most important contribution of Timurid architecture, however, is in the decoration of buildings. Although it belongs to a pre-Timurid tradition, the decorative element in Islamic architecture had never gained such prominence as at this period. For the first time huge surfaces were decorated with facings of carved and glazed tilework (used particularly in the Shāh-i-Zind necropolis in the late 14th century). Flat surfaces, round and angular columns, niches, arcades, stalactite work, and interiors of domes were faced with a decoration of elaborate, deeply cut arabesques; these usually formed motifs repeated countless times, but sometimes also central designs within polylobate or arched cartouches. The glaze was turquoise or deep blue, with white for the inscriptions. Polychrome tiles, too, were used for abstract geometric ornamentation, and blue-and-white tiles for the ornamental motifs inspired by Kufic script; examples are to be found in the Bībī Khānum Madrasah, the Aq Saray, the Gūr-i-Mīr, and the Madrasah of Ulugh-Beg, to name only the most important. Sometimes ceramic panels in relief were employed with multicolored glazing and floral and figural designs of Far Eastern provenance (e.g., phoenixes with ribbon-shaped clouds, lotus flowers, and peonies).

The most elaborate carved and glazed tilework appears in the Mausoleum of Bayān Kūlī Khan at Bukhara (1357/1358) — fragments of the decoration of this building are to be found today in Hamburg (Mus. f. K. u. Gewerbe) and in London (Vict. and Alb.) — and in the Mausoleum of Chujuk Biqa, Tīmūr Lenk's sister (PL. 69), erected in 1371 in the Shāh-i-Zind necropolis and inscribed with the names of the master craftsmen Shams ad-Dīn and 'Izz ad-Dīn. The most extraordinary build-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

ing in this respect is the first tomb of the anonymous group, erected about 1380 in the same necropolis. Monumental in its simple square shape, it is decorated in relief on the façade with elaborate ribbon-shaped designs of glazed tile, which to the right and left of the entrance liwan form star-shaped, polygonal, and cross-shaped panels ornamented with Kufic lettering. The inside walls of this liwan are decorated with patterns of unplastered brick, panels of carved tilework, and floral and geometric reliefs of great beauty. The whole interior of the building is covered with tilework in geometric designs. The interlaced motifs, found in other buildings as well, are repeated on the interior of the dome.

The first building in which a different technique is used is the Mausoleum of Shīrīn Biqa Āqā (1385; PL. 69), where the whole façade is covered with delicate motifs in a floral and geometric pattern made out of tesserae of glazed earthenware set by a mosaic technique. The exterior of the drum is decorated in the same way, while the cupola is faced with patterned brickwork in contrasting shades. The interior of the building, unique of its kind, is adorned with paintings that are comparable only with the frescoes of trees and ornamental designs in the Bībī Khānum Madrasah. The introduction of faïence mosaic ("tile mosaic") — employed at about the same time in the Masjid-i-Jāmi' of Yezd — transformed the whole appearance of Timurid architecture and, together with the use of patterned brickwork, became the most characteristic feature of architectural decoration in the 15th century. Large inscriptions often dominated the decoration of the façades. Floral motifs and arabesques in faïence mosaic were employed to cover broad surfaces of the palace of Aq Saray. The delicacy of execution displayed in this and other buildings of the period is paralleled, in the 15th century, only in the work of the artists who were engaged on the Muṣallā of Gauhar Shād at Herat and on the Blue Mosque at Tabriz. The Shrine of Khwāja Abū-Naṣr Pārsā at Balkh, of the late 15th century, is one of the few buildings that approaches these in richness and elegance.

Plans of Timurid mosques. (*a*) Meshed, Mosque of Gauhar Shād (*from A. Godard, L'art de l'Iran, Paris, 1962 fig. 244*); (*b*) Tabriz, Blue Mosque (*from SPA, II, fig. 405*); (*c*) Herat, Muṣallā of Gauhar Shād. *Key*: (1) surviving walls, (2) restoration (after a sketch by Durand), (3) imaginary reconstruction (*ibid., fig. 404*).

PAINTING. The innovations of Timurid painting had precedents in the miniatures executed at Shiraz, Tabriz, and Baghdad in the late 14th century, under the rule of the Muẓaffarids and the Jalā'īrids. The new style appears for the first time in a *Shāh-nāma* ("Book of Kings") of Firdausī, written and illustrated in Shiraz in 1370 (Istanbul, Topkapı Saray Lib., Ms. 1423). It is not clear whether this new style was developed at Shiraz or in the more advanced court schools of Tabriz (X, PL. 255) or Baghdad, since it was actually in this last city that the most beautiful manuscript of the new style was produced, a copy of a *dīwān* of Khwājū Kirmānī, dated 1396 (Br. Mus., Add. Ms. 18113) and illustrated with nine miniatures by the painter Junayd Naqqāsh, a pupil of Shams ad-Dīn, who was in turn a disciple of Aḥmad Mūsā. Although no manuscript of the period has been preserved that can safely be attributed to Tabriz, it seems highly probable that the new manner derives from the late Ilkhan style as it is represented in the miniatures of the great *Shāh-nāma* known as the Demotte (VII, PL. 401; X, PL. 88). The attempts to relate the new style to the figure of Aḥmad Mūsā, whom Dūst Muḥammad, writing in 1544, called the inventor "of the new style" or "of the style of painting which is in favor at this period," have hitherto found no grounds for confirmation, as there is no work that can be attributed to this master with certainty.

The most notable feature of the new Timurid style (although derived from the preceding period) is a new conception of space. In miniature painting the horizon is placed high so that different planes are formed in which are arranged, almost in perspective, objects, figures, trees, flowers, and architectural motifs. This enables the artist to paint larger groups with greater variety and spacing and without overcrowding. While the painters of Shiraz for the most part accepted the limitations imposed by the border of the miniature, Junayd Naqqāsh, at least in some of his works, broke away completely. His painting in fact covers the entire surface of the page with a superbly designed landscape that unfolds from the nearest plane (at the bottom of the page) to the horizon (at the top of it). In the center, on the ground, stand the various figures. This type of painting thus reflects a bird's-eye perspective, in contrast to the earlier frontal view.

Of Timurid easel painting nothing remains, and of mural painting almost nothing, although contemporary sources amply document its existence. Aḥmad ibn-'Arabshāh describes in considerable detail the frescoes that decorated the palace of Tīmūr Lenk at Samarkand, in which the great conqueror was shown with his court in the garden or in the palace, in victorious battle with his enemies, giving audience to nobles of his court or to foreign ambassadors, with members of his family or with his harem. The same Aḥmad ibn-'Arabshāh and Sharaf ad-Dīn also mention frescoes in other palaces and pavilions of Tīmūr Lenk and of nobles of his court. Stchoukine (1954) maintains that these paintings, both in subject matter and in style, had close links with miniatures of the period, chiefly on the ground that Tīmūr Lenk brought to Samarkand the foremost artists from the cities he had conquered, especially Tabriz, Isfahan, Shiraz, and Baghdad. However, the very fragmentary remains of the purely decorative frescoes in the Mausoleum of Shīrīn Biqa Āqā (in the Shāh-i-Zind necropolis) and in the Bībī Khānum Madrasah, with their very free design, must not be forgotten. With these may be compared the landscape paintings in a Persian anthology made probably at Shiraz in 1398 and now in Istanbul (Mus. of Turkish and Islamic Arts, Ms. 1561).

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

In the early phase of Timurid painting, from about 1390 to 1420, the style throughout the empire was more or less uniform. The most beautiful work of this early phase is the anthology made for Sultan Iskandar ibn-'Umar Shaykh ibn-Tīmūr in 1410, probably at Shiraz (Lisbon, Gulbenkian Foundation). Although they continue the tradition of the late 14th century, as represented in the two volumes of a collection of epic poetry, written at Shiraz in 1397 and now preserved in London (Br. Mus., Or. 2780) and in Dublin (Chester Beatty Lib., P. 114), the miniatures in the Gulbenkian anthology show the early Timurid style at its best. The brilliant colors, calligraphic precision of drawing, perfect harmony of composition, and inventive wealth of detail create an effect of magnificence that has all the qualities of the later style of the school of Herat. Another anthology made for Sultan Iskandar is also preserved in the British Museum (PL. 71). Of about the same date is Niẓāmī's *Khamsa* ("Five Poems"), formerly in the Louis Cartier Collection, Paris (X, PL. 91). With the viceroyalties of Sultan Ibrāhīm at Shiraz (from 1414) and Bāysunghur Mīrzā at Herat, a distinctive style developed in each of these cities.

The style of Shiraz. Under the patronage of Sultan Ibrāhīm (1414–35), the school of Shiraz, basing itself upon the early Timurid style, created a highly stylized manner of painting in which bright and vigorous colors predominated. The compositions were simple and contained few figures, well drawn and rather affected, with features lacking in expressiveness. The mouth was small, the nose narrow, the eyes almond-shaped, the head oval and elongated; the men often had mustaches and pointed beards. The best examples of this style, which continued after the death of the prince into the second half of the century, when it was assimilated into the Turkoman style, are an anthology of 1420 made for Bāysunghur Mīrzā (Berlin, Mus. in Dahlem, Islamische Abteilung, J. 4628), illustrated with 32 miniatures; a *Shāh-nāma* made for Sultan Ibrāhīm, probably in 1425, with 47 miniatures (Oxford, Bodleian Lib., Ous. Add. 176); and the copy of the *Ẓafar-nāma* ("Book of Victories") of Sharaf ad-Dīn, dated 1436 (New York, Kevorkian Foundation; Met. Mus., Ms. 55.121.17; Cambridge, Mass., Fogg Art Mus.; Worcester, Mass., Art Mus.; etc.).

The Turkoman style. Although various local traditions (from Herat and Mazanderan) came together in the Turkoman style, it derived chiefly from the painting of Shiraz. Indeed, this city seems to have been the center of the school, although the oldest manuscript in the Turkoman style, a *Khamsa* of Niẓāmī (Princeton, Univ. Lib.), was made at Abarquh and bears the date 1446. However, seven manuscripts have survived dated between 1482 and 1513, which, judging from the colophons, were made at Shiraz and which contain paintings in the Turkoman style. Characteristic of this style are the rich, dramatic colors; the elaborate design, which makes all the elements in the painting become parts of an almost decorative scheme; the imposing figures with thick bodies, large heads, and vehement gestures; and the backgrounds of exuberant vegetation in different shades of yellow and green. The most important works of the school are the 155 miniatures of the *Khāvarān-nāma* of Ibn-Ḥusām (PL. 312), which is dated about 1480 (Teheran, Decorative Arts Mus.; Met. Mus., Ms. 55.125.1; Bridgeport, Conn., Olsen Foundation; Cambridge, Mass., Fogg Art Mus.; Dublin, Chester Beatty Lib.; and private collections); some of them are dated 1477 and signed by the painter Farhād — the first painter's signature to have survived after that of Junayd Naqqāsh of Baghdad. The Turkoman style extended into the early Safavid period (see SAFAVID ART) but seems to have faded out toward the middle of the 16th century.

The style of Herat. The first products of the court school of Shah Rukh were under the direct influence of the early Timurid style, but since Herat is at some distance from the old art centers, these works are archaic, derived from pre-Timurid, especially Ilkhan, models (see ILKHAN ART). The drawing of the figures is often clumsy and the compositions are primitive. The new convention of the high horizon with the arrangement of figures and objects in a landscape or in architectural perspective was still not fully developed. The colors are soft and harmonious, but they lack the brilliance of either the early Timurid or the Shiraz style. This initial phase of Herat painting, which continued until about 1425, is exemplified particularly in the series of monumental editions of the *Jāmi' at-Tavārīkh* of Rashīd ad-Dīn made in about 1410–25 (Paris, Bib. Nat., Sup. pers. 1113) and of the *Majma' at-Tavārīkh* of Ḥāfiẓ-i Abrū (Istanbul, Topkapı Saray Lib., H. 1653) and in manuscript pages of codices dispersed in various collections.

The early style of Herat properly so called, which developed independently in the atelier of Bāysunghur Mīrzā, where the young prince had assembled the greatest artists of the time, is basically nothing but a more perfect form of the early Timurid style that had flourished at the beginning of the century. It is distinguished by sumptuous colors, an almost incredible precision of detail, perfect unity of composition, striking individual characterization of the human figures, and the utmost sensibility in conveying atmosphere, from the hieratic and solemn to the gaiety and playfulness of narrative — almost genre — painting.

The most beautiful of the eight manuscripts completed before the death of the prince (1433) is the *Shāh-nāma* of 1430 (Teheran, Imperial Lib., Gulistan Palace) with a double frontispice (IX, PL. 8) and 20 (mostly full-page) miniatures. To the same year belongs a superb manuscript of the *Kalīla u Dimna* (Istanbul, Topkapı Saray Lib., R. 1022) illustrated with 25 miniatures. In both these manuscripts the magnificence and large proportions of the miniatures may be noted. Among smaller manuscripts, with extremely delicate, exquisitely designed illustrations, are: the *Gulistān* ("Rose Garden") of Sa'dī of 1426/1427 (Dublin, Chester Beatty Lib., P. 115); an anthology of the same year (Settignano, near Florence, Berenson Foundation); a copy of the *Humāy u Humāyūn* of Khwājū Kirmānī dated 1427, with three illustrations (Vienna, Nationalbibliothek, Kod. F. 382); and a *Haft Paykar* ("Seven Beauties") of Niẓāmī from about 1430 (Met. Mus., Ms. 13.228.13).

Only nine manuscripts can be attributed to Herat in the period between 1433 and 1480. Of these the most important are the version in Uigur of the *Mi'rāj-nāma* of Mīr Ḥaydar dated 1436 (Paris, Bib. Nat., Sup. turc 190, with 63 illustrations) and the *Shāh-nāma* of 1440 (London, Royal Asiatic Soc., Pers. Ms. 239, with 32 miniatures); the latter derives directly from the *Shāh-nāma* in the library of the Gulistan Palace but is even more sumptuous in coloring and more elaborate in composition.

Of particular importance are the six illustrations of the *Khamsa* of Jamālī, painted in Baghdad in 1465 (PL. 72), which anticipate in an astonishing manner the work of Bihzād and his school. Bihzād (q.v.), the most famous painter of the period, was certainly active from 1480 to 1530 (in some opinions until 1535/1536); his style is shown above all in the miniatures, which are undoubtedly by him, in the manuscript of the *Būstān* ("Orchard") of Sa'dī (X, PL. 91) painted for Ḥusayn Bayqarā in the month of Rajab, A.H. 893 (June, 1488).

The Timurid school of Herat continued at Bukhara, where the Uzbeks brought many painters after they had overrun Herat in 1507 and at several other times in the first half of the century; it also continued at Tabriz, where Shah Ismā'īl Ṣafavī sent other Herat painters after 1510 and where he brought Bihzād in 1522 to direct the Imperial Library (*kitāb-khāna*).

CALLIGRAPHY AND BOOKBINDING. As in other periods of Islamic art, painting was only one of the aspects of art in the production of books; calligraphy, the illumination of frontispieces, of the chapter headings, and of colophon pages, and the binding of manuscripts were all executed with extreme care and exquisite taste. Calligraphy (q.v.) was always considered one of the highest forms of art in Islam and was practiced not only by professional calligraphers, many of whose names are known, but also by Timurid princes and nobles themselves. Writing, particularly as regards the Koran, was, at least up to a certain point, an act of piety, and the various forms of calligraphy had a direct relation to the speculations of the Sufis.

One of the most important calligraphers of the late 14th cen-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

tury was Mīr 'Alī of Tabriz, known as "Qiblet-ul-kuttāb" ("model of calligraphers"), to whom is attributed the invention of nastaliq, a new script based on an ingenious fusion of Naskhi and taliq. 'Abd-Allāh, his son and disciple, perfected it and produced a special type of calligraphy in which letters of various colors were cut out and mounted on paper of contrasting color. A product of the same school, Maulānā Ja'far of Tabriz became the chief of the 40 calligraphers who worked for Prince Bāysunghur (ca. 1430); for this reason he is also known as Ja'far Bāysunghurī.

The Timurid style of calligraphy, as developed at Herat, was spread throughout the empire by another Mīr 'Alī (d. 1425), whose teacher, Maulānā Aẓhar of Tabriz, was known as "Ustād-i ustādān" ("master of masters"). Mīr 'Alī's greatest pupil was Sulṭān 'Alī ibn-Muḥammad of Meshed (d. 1513), who worked for Sultan Ḥusayn Bāyqarā in Herat and copied most of the important manuscripts of the period.

The arts of calligraphy, illumination, and painting were often practiced by the same artist. Mīrak Naqqāsh, for example, began as a calligrapher, went on to illuminate manuscripts, and finally became one of the greatest painters of the court school of Herat. At the end of the 14th century it became fashionable to illuminate manuscripts with naturalistic designs of great delicacy and extraordinary precision of detail. There is an exceptional example of this type of illumination in the pages of the Persian anthology (see above, *Painting*) written by Muḥammad al-Ḥalvā'ī al-Jalālī al-Iskandarī and Nāṣir al-Kātib in Fars in 1410/1411 for Sultan Iskandar ibn-'Umar Shaykh, in which various ornamental motifs, including cartouches with Chinese groupings of animals, are drawn in gold across the whole page.

"The 15th century was the golden age of the art of binding in Persia" (Aga-Oglu, 1935). Whereas in the preceding period the covers of books were decorated with simple, often geometric, designs stamped on leather, at this time the art of binding, especially in the atelier of Prince Bāysunghur, was distinguished by an astonishing richness in techniques and in the use of decorative motifs. Dūst Muḥammad states that Bāysunghur brought a bookbinder from Tabriz, called Ustād Qivām ad-Dīn, to whom is attributed the invention of the *munabbat kārī* (a design cut in filigree). Indeed, it is chiefly in the bindings of Herat that these decorative features appear. The most intricate example of such filigree is undoubtedly the inside of the cover of a volume of poetry by Qāsim, transcribed in 1459 at Shiraz (Istanbul, Mus. of Turkish and Islamic Arts, Ms. 1551); this was almost certainly done at Herat, as can be seen by comparing it with the binding of a manuscript with a text by Mīr 'Alī Shīr Nawā'ī in the library of Istanbul University (Ms. 2782/32). On these same bindings, decorations in relief were also used, especially on the outside; these are often small, like the filigree motifs, but equally often represent fantastic Chinese animals. In the binding of a volume of Jalāl ad-Dīn Rūmī, done for Sultan Ḥusayn Bāyqarā at Herat in 1483 (Istanbul, Mus. of Turkish and Islamic Arts, Ms. 1537), three techniques are combined: embossed reliefs, filigree work, and painting on leather (see LACQUER).

DECORATIVE ARTS. *Ceramics.* Very little is preserved of the undoubtedly large output of ceramics. Chinese blue-and-white porcelain, introduced into Persia in the second half of the 14th century and depicted for the first time in the manuscript of Khwājū Kirmānī in 1396 (see above, *Painting*), started a new fashion that dominated the production of ceramics throughout the 15th century. The decorative designs of Persian blue-and-white ceramics are entirely Chinese (see CERAMICS). Against the white background of this heavy ware, which consists mainly of bowls and large plates with wide rims, are shown, in various shades of cobalt blue, lotus flowers, peonies, ribbon-shaped clouds, crags, dragons, phoenixes, deer, and ducks on stylized waves. In the same period smaller and more delicate bowls were being produced, with less elaborate decoration. This style was to continue into the 16th century, when bolder motifs were developed with landscapes and large figures of animals.

In the early Timurid period no center of ceramic production is known; however, it is certain that the Timurid capitals — Meshed and Herat in Khorasan, Bukhara and Samarkand in Central Asia — possessed large factories where not only the magnificent tiles that decorate the buildings of the period were produced but also pottery. At Herat the name of a master craftsman is known, Maulānā Ḥājjī Muḥammad Naqqāsh, who died in 1507. A fragment of a spittoon, now in Edinburgh (Royal Scottish Mus.), bears the inscription "completed in Meshed of Imam Riẓā for Maulānā Hishām ad-Dīn of Shiraz 848" (A.D. 1444); this shows not only that the products of this city were famous enough to receive commissions from southern Persia but also that pottery of this kind was not made at Shiraz and perhaps not at Tabriz either.

At the same time imitations of celadon, already popular in the 14th century, continued in fashion. In the second half of the 15th century a new type of ceramics emerged, of which four dated pieces survive. The large plates and bowls are decorated, underneath a pale turquoise glaze, with black panels that radiate from the center. On these, spiral motifs are incised, while in the interstices can be seen floral patterns of Chinese origin; at the edges, or sometimes in the center, there are inscriptions. The pottery is made of soft, loose, porous clay with a thin, unequal, often shiny glaze that is sometimes spoiled by wide cracks, through which dirt and grease attack the vase itself, destroying its color and glazing. These vases belong to a variety fully developed only in the 16th and 17th centuries and known under the name of Kubachi, after the small city of the same name in Dagestan, where many pieces were discovered in the 19th century. The factory in which this ware was produced may have been at Tabriz, although there has so far been no definite proof of this.

Metalwork. Metalwork, the production of which flourished in the 14th century, seems to have undergone a period of decadence, as regards both quality and quantity. In general, pre-Timurid forms persist (candelabra, cups, caskets), but although the technique of incrustation did not change greatly, it became coarser. Few surviving pieces can be dated exactly. The products of the late 14th century rarely reveal new shapes or basically new ideas in the working of the metal. Among the most important pieces are a candelabrum with the name and titles of Tīmūr Lenk and the signature of the artist 'Izz ad-Dīn ibn-Tāj ad-Dīn of Isfahan, which is dated Ramadan, A.H. 799 (May, 1397; Leningrad, The Hermitage); a large bronze caldron (*siqāya*), also bearing Tīmūr Lenk's name, made by 'Abd-al-'Azīz ibn-Sharaf ad-Dīn of Tabriz, with the date Shawwal 20, A.H. 801 (June 25, 1399), now in the Mosque of Aḥmad Yasavī at Turkestan; a candelabrum in the same mosque, very similar to that in The Hermitage, signed by the same artist and dated 1397; and lastly another caldron, now in the Masjid-i-Jāmi' of Herat. Parts of other candelabra of this kind are also preserved, one of which is in the Louvre and another in The Hermitage, both inscribed with Tīmūr Lenk's name. These pieces admirably represent the taste of the early Timurid period; they are large and heavy, and the shape is simple, powerful, tectonic. The candelabra rest on large circular bases; the stems are short, thick, and elaborately worked; the sockets are heavy, large, and extremely simple in shape. The decoration consists solely of large-scale engravings and silver and gold incrustations in small areas. The Herat caldron is an exception, with its elegantly designed arabesque in relief. Particularly remarkable is the complete absence of figural representations. Such a style appears to have been in vogue throughout the 15th century.

Another typical variety of Timurid metalwork is seen in the openwork plaques used to decorate doors (for example, in the Mosque of Aḥmad Yasavī at Turkestan), wooden chests, and other pieces of furniture. These consist almost entirely of stylized floral motifs that sometimes form a lacework of metal. At the same time, conventional forms continued to be produced, such as the bell-shaped candelabra similar to those of the 13th and 14th centuries; a candelabrum of Abū-al-Naṣr Ḥasan Sulṭān Beg Bahādur (New York, Parish-Watson Coll.) is a typical example of the blending of traditional with new Timurid forms. A group of small vases and little brass jugs

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

with stylized decorations of floral motifs, hitherto considered Venetian work of the 16th century, should be attributed to the school of Herat of the late 15th century, since a similar piece in the British Museum (Inv. no. 1962-7-18-1) is inscribed with the name of Sultan Ḥusayn Bāyqarā and dated A.H. 903 (A.D. 1497).

Of gold- and silverwork (q.v.), apart from a very few pieces, nothing has survived of what must have been a superb output of articles and ornaments in precious metals. The miniatures of the 15th century show gold jewelry sometimes incrusted with stones; and contemporary sources state that Tīmūr Lenk wore magnificent brocades sewn with precious stones and that from his turban hung an enormous ruby.

The use of precious and semiprecious stones for household objects was widespread, under the direct influence of Chinese models. Jade in particular was employed for small bowls and jugs with dragon-shaped handles; it was also used for seal rings, such as the gold ring now in the Metropolitan Museum of New York (no. 12.224.6).

Arms were worked with great skill and richness (see ARMS AND ARMOR); many have been preserved.

Wood carving and stonework. In Central Asia the local tradition of monumental wood carving continued into the Timurid period, from which there remain great doors, entire mihrabs, mimbars, *maqṣūras*, and cenotaphs. Many of these works are dated and signed. The decorative motifs are strictly ornamental — floral or geometric, or sometimes both. The intaglio is very deep and precise in detail, giving the wood the appearance of metal. Examples are the cenotaph of Saif ad-Dīn Bākharzī (Bukhara, Mus.), probably executed in the second half of the 14th century, and the door of the Madrasah of Ulugh-Beg in Samarkand, carved in 1417. More freely decorated objects also were made, with only floral, almost naturalistic, motifs. Examples of this style are a Koran stand (Met. Mus., no. 10.218) dated Zu'lhijjah, A.H. 761 (Oct./Nov., 1360), made by Ḥasan ibn-Sulaymān of Isfahan; the door of the Mosque of the Shāh-i-Zind in Samarkand, from the end of the 14th century; the door of the Mosque of Aḥmad Yasavī at Turkestan, of about the same date; one of the doors of the Gūr-i-Mīr, now in Leningrad (The Hermitage), carved in about 1405; and the doors of the mosque of Afushta, near Natanz, one of which is dated Ramadan, A.H. 831 (June, 1428), and the other signed by Ustād Ḥusayn ibn-'Alī Najjār Naqqār (cabinetmaker and joiner) of 'Abbadi, near Natanz. Both these doors were made on commission for the same person, one Sayyid Ḥasan, probably at about the same time, if not actually by the same artist; they are perhaps the best examples in Persia itself of the Timurid style of Central Asia, which continued throughout the 15th century and even into the early Safavid period (see SAFAVID ART).

This free floral and arabesque style was also used to decorate tombstones (there is an example in the Isabella Stewart Gardner Mus., Boston), wall panels, bases of columns, and doorposts (e.g., the marble doorway of the Bībī Khānum Madrasah in Samarkand).

Carpets. Although no piece has survived intact, miniatures afford ample documentation of the beautiful carpets made in the 15th century. In these, unlike the carpets at the Persian court in the 16th century, geometric motifs after the Turko-Asiatic fashion seem to have been preferred. Apart from a few examples of the late 15th century, the decorative borders are really friezes with highly stylized Kufic inscriptions. The designs of these carpets, which vary in size, are bright, vigorous, and simple. The colors are varied, while the different combinations of decorative motifs reveal the sophisticated taste of the Timurids.

Toward the end of the 15th century, however, it seems that arabesques and floral elements, which were quite independent of the previous tradition, became popular, although the first floral motifs had already begun to appear in borders toward the middle of the century. On the other hand the production of carpets with geometric designs never entirely ceased. The change is perhaps due to the influence of Bihzād; in fact, in his miniatures of the *Khamsa* of Niẓāmī (II, PL. 299), executed in 1494, can be seen carpets of the new type, while in the miniatures of the more conservative Mīrak Naqqāsh, those with geometric designs are given preference. The central part of the carpets decorated with floral arabesques continued to be divided into geometric units; all the other motifs are floral. The tendency to emphasize a central pattern is also very clear, although in all these carpets decoration of endless intricacy is predominant.

Almost nothing has remained of the magnificent Timurid brocades and embroidered materials that are depicted in the miniatures.

TINO DI CAMAINO. Italian sculptor (b. Siena, ca. 1285; d. Naples, 1337). Tino started his activity in Siena on the Cathedral, for which Giovanni Pisano (q.v.) was Capomaestro. His first work under Giovanni was the architrave for the main door of the Cathedral (E. Carli, 1934). In this work the style of Giovanni Pisano, although outwardly followed in its general lines — especially in the way the bodies are twisted and the limbs bent — is intrinsically contradicted, for the structure springs from a different sensitivity. While Giovanni seemed to devaluate almost dogmatically the nature of the material, seeing it only in its dynamic possibilities, Tino let the material assert itself in volumes that are condensed and contracted into tranquil forms. These forms already have a personal flavor, though they can be traced back to Nicola Pisano (q.v.) or, better, to Arnolfo di Cambio (q.v.). Shortly after 1300 Tino was in Pisa; whether he was an assistant of Giovanni Pisano there is not known, but he was certainly working on the Cathedral, for which, again, Giovanni was Capomaestro. In Pisa, in 1311–12, Tino executed the altar of S. Ranieri in the Camposanto and soon afterward the baptismal font for the Cathedral, which is signed by him (largely destroyed by fire in 1595; fragments in Pisa, Mus. Naz. and Camposanto). The importance of this work suggests that previous works, now lost, must have gained him the reputation on the basis of which, perhaps as early as 1312, he was commissioned to execute the tomb of Emperor Henry VII, which he completed in 1315. In the same year Tino was called to replace Giovanni Pisano as Capomaestro; but in 1318 he was deprived of the post for being a Guelph (in Ghibelline Pisa), though it was not until 1322 that he was officially dismissed.

The emperor's tomb has been dismantled, so its original appearance is conjectural. In the Camposanto of Pisa, only some large figures remain, together with the smaller statues of the Annunciation group and a few other pieces whose connection with the tomb is difficult to ascertain. The front of the sarcophagus, now in Pisa Cathedral, shows a large group whose choirlike alignment is emphasized and almost "scanned" by the rhythm created mainly by the small overhanging arches that frame and isolate each individual head. In the superbly sculptured figures (pl. 74) perhaps originally situated above the sarcophagus under a canopy, a new style, which was to remain basically consistent and characteristic throughout Tino's work, asserted itself fully for the first time. The central figure of the seated emperor shows the first signs of that process of abstraction which was to lead to the reclining figures of the artist's later period, in which the flowing linear play of the surfaces synthesizes and enhances a keen sense of volume. In the figures of the attendants, however, almost as if to differentiate them from the central figures, the volumes, squared to the point of becoming geometric, seem to be turning slowly, creating a tension that is emphasized by the sharp bends of the arms and the position of the feet. The same characteristics reappear in Tino's Madonna in Turin (Mus. Civ.).

The year 1318 saw Tino in Siena, where he executed the tomb of Cardinal Riccardo Petroni (pl. 73), perhaps with the collaboration, for the architectural parts of the work, of his father, who seems to have been associated with him in the office of Capomaestro from 1317 to 1320. The tomb has been often dismantled and reassembled; but the present arrangement offers a fairly clear idea of the structural scheme of Tino's tombs of that period: a sculptured sarcophagus, supported by allegorical figures, on which the recumbent effigy was represented under a canopy, generally between two figures of angels or clerics. In the relief on this tomb the treatment of the volumes is decidedly compact; the forms seem hardly separated from the background, to which the planes tend to run parallel and to which the incisions, whether deep or superficial, are perpendicular.

In 1321 Tino left Siena to go to Florence, where in the same year he created the funerary monument (signed) of Bishop Antonio Orso in the Cathedral, that of Gastone della Torre in the cloister of Sta Croce, and, according to some scholars, that of Tedice Aliotti di Fiesole in S. Maria Novella; the latter, however, was executed with considerable assistance. Unfortunately, these works have suffered as much misfortune as his other works of the Florentine period and are now not only partly dismantled but scattered in various museums in Florence, as well as in Frankfurt am Main (Liebighaus), Berlin (Staat. Mus.), and London (Vict. and Alb.). However, it can be inferred that the general plan of all of them was more or less the same as that of the Petroni tomb, with the exception of the monument of Bishop Orso; here the bishop is represented as a strongly characterized seated figure above the sarcophagus, with eyes closed, as though in sleep. No less powerful are the Madonna and Child (*Sedes sapientiae*; VI, pl. 365), which may have belonged to the Orso monument, and the beautiful *Charity* in Florence (pl. 76).

In about 1323 Tino went to Naples to the court of the Angevins. The first work attributed to him there is the tomb of Catherine of Austria, first wife of Charles, Duke of Calabria, in the Church of S. Lorenzo Maggiore. However, this monument lacks unity in its architectural parts, and its sculptural elements are easily discriminated; the structure was probably executed before Tino's arrival by various Roman and Neapolitan artists of diverse merits and inclinations, as indicated by the schemes and by the variety and character of the mosaic sections. To Tino can be attributed the recumbent effigy of the princess, serene and almost ethereal; the massive figures of four atten-

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

dants at head and foot guarding her sleep; the relief of the Stigmatization of St. Francis — reminiscent of the iconography of Giotto — on the gable of the canopy; and the two superbly sculptured supports. On one of these a female figure, shown in front view, and two small figures form a forceful unitary volume whose details, rather than breaking it up, enhance its weight, which is mitigated only by the wisps of flamelike hair that join the figure to the base of the sarcophagus; on the other the figure is turned sideways, and the effect of a rotating movement of the mass is accentuated by sharp angles, which are, however, without any suggestion of dynamism.

Between 1324 and 1326 Tino executed the tomb of Queen Mary of Hungary (PLS. 74, 75), widow of Charles II of Anjou, in the Church of S. Maria Donnaregina. The architectural structure of this monument was the work of Gagliardo Primario, a Neapolitan architect of the first half of the 14th century; but Tino undoubtedly contributed to it, achieving such a perfect blend of architecture and sculpture that the work appears to be a single sculptured block, in which the sepulchral scheme derived from Arnolfo di Cambio is reinterpreted according to local tradition. Within this scheme the sculpture comes alive: the reclining figure, an image aloof and serene, all spacious, elongated planes; the relief on the sarcophagus, which develops the rhythmic motif that first appeared on Henry VII's sarcophagus — here achieved by niches that isolate the seated figures of the Queen's sons or courtiers; the angels who draw back the curtains; the delicate Madonna (sister to the Bardini *Charity*), flanked by two angels and the kneeling Queen, on the canopy; the fine archangel at the top of the monument, contained but full of potential motion; and finally, the impressive figures supporting the sarcophagus. Tino put his whole art into the making of these sculptures, which are the highest manifestation of his mastery. His style had acquired a Gothic flavor that met the taste of the Angevin court but came to him primarily through contemporaneous Sienese painters, especially Simone Martini, who had been active in Naples shortly before Tino's arrival. From Gothic art, however, he accepted only certain aspects, which, though they may have colored his work with a touch of intellectualism, were nevertheless transformed by his vision, in which it was always the classicist element — perhaps an influence of Nicola Pisano — that formed the framework and basis. His was thus a fundamentally anti-Gothic vision, comparable to (if anything) that of Ambrogio Lorenzetti (q.v.), not so much owing to any exchange between the two as to their being offspring of the same culture.

From this point on, Tino's work extended to other fields. Between 1325 and 1337 he supervised the building of the Certosa di S. Martino and the modernizing of the nearby Castle of Belforte, later known as Castel S. Elmo; in 1334–35 he was in charge of the enlargement of the city's arsenal; and in 1335 he supervised the building of the bridge (destroyed) in the park of Castel Nuovo. Obviously he could not personally attend to all the work that the Angevin court commissioned him to execute and was therefore obliged to employ numerous assistants. The designs of the funerary monuments created during that period were undoubtedly his; nevertheless, owing to his dominant sculptural sense, the architectural parts of the monuments lack the coherent unity that characterizes the tomb of Mary of Hungary. As a result, the sepulchers and the tabernacles in which they are enclosed, though physically still forming a whole, have the appearance of unrelated elements. In contrast, the sculptural parts signed by Tino are of a uniformly high quality. These sculptures (all in Naples) include the reclining figure of Mary, little daughter of Charles of Calabria (Church of S. Chiara); the beautiful fragment of a female figure (Mus. Naz. di S. Martino), perhaps once part of the tomb of Mathilde de Hainaut (destroyed), repudiated first wife of John, Duke of Durazzo; at least one of the dismantled Angevin tombs in the Cathedral that were commissioned by Robert of Anjou in 1333; perhaps the monument of Charles Martel of Hungary, of which there remains a recumbent figure, unmistakably the master's own, which was later incorporated in the funerary monument of a certain Matteo Caracciolo in the Cathedral; a small figure of Fortitude, which was also part of a tomb; the Madonna, *Mater orbis*, now in the lunette of the 15th-century main portal of the Cathedral; and the two lions, each supporting a column, in the same portal.

For the tomb of Mary of Valois, second wife of Charles of Calabria, in S. Chiara, the parts that Tino created are the delicate and refined image of the recumbent princess, the Madonna above the canopy, and the two figures of the Annunciation on the front corners of the sarcophagus. The monument of Charles of Calabria, in the same church, was designed by Tino (1332–33), but he probably executed only the groups of angels supporting the sarcophagus, for neither the figures at the back and front nor the recumbent effigy can be attributed to his hand. Also his are the fragment of a Crucifixion discovered in S. Chiara (where the back of it had been reused in a later monument), in which Tino briefly returned to his early style, condensed and compact but not dry; the pieces of an altar in the Abbey of the Trinità in Cava dei Tirreni, where traces of the influence of the Pisanos are apparent (e.g., the seated Madonna); and the groups on the sides of the crucifix, now lost, which are reminiscent of, and possibly contemporaneous with, the figures of the attendants on the tomb of Charles of Calabria, although they are not of the same quality.

Tino's assistants played an even greater part in the making of the tombs of Philip of Taranto and John of Durazzo, in the Church of S. Domenico Maggiore; the monuments are now dismantled, but their front reliefs are still in the church. Some figures that presumably formed part of these tombs are signed by Tino: the Madonna and Child, the St. Dominic with John of Durazzo (both, Naples, Mus. Naz. di S. Martino), and the small, seated Madonna that is now part of an altar in S. Domenico Maggiore. But various fragments in private collections and in the Cleveland Museum of Art and the female figures later inserted in the 16th-century candelabrum in the Church of S. Domenico are the work of assistants, although some critics (e.g., Valentiner, 1935) attribute them to Tino. Also Tino's is a small votive relief showing Queen Sancia, wife of Robert of Anjou, with the Virgin and Child (Washington, D.C., Nat. Gall.), which may have come from S. Chiara.

According to documents in Naples (E. Carli, 1934, p. 96), Tino died during the second half of 1337. His workshop continued to spread his designs throughout the south of Italy until the 15th century; but the impetus of his art gradually faded with his last followers and with the emergence of new Florentine and Roman influences that began to penetrate southern Italy in the middle of the 15th century.

TINTORETTO. The sources are not in agreement on the year of birth of Jacopo Robusti, the Venetian painter known as Tintoretto. Ridolfi (1642) gives it as 1512, whereas Borghini (1584), in reporting the artist's age as sixty, brings it up to 1524. The death certificate, dated 1594, states that Tintoretto was seventy-five years old (thus born in 1519). On the other hand, in the portrait engraved in 1588 by Gijsbert van Veen, after Ludovico Pozzoserrato (Lodewyck Toeput), the sitter's age is given as seventy, which puts his birth in the year 1518.

Born in Venice, most likely in 1518 or 1519, Tintoretto was the son of Giovanni Battista Robusti, a silk dyer; the family probably originated in Lucca. The painter signed a will of 1539: "Jo mistro Giacomo depentor nel champo di San Chassan. . . ." In 1544 he was still living in S. Cassiano; in 1555

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

he was recorded as living in S. Marziale. In 1574 he bought a house on the Fondamenta dei Mori near the Church of the Madonna dell'Orto. About 1555 Tintoretto married Faustina, daughter of Marco Episcopi (dei Vescovi), who was a dean in 1536 and Grand Guardian in 1544 of the Scuola Grande di S. Marco. Their daughter Marietta was born in 1556 according to Borghini (1584), four years later according to Ridolfi (1648). Their first son was Giovanni Battista. There followed Domenico, about 1560, and Marco, probably in 1561, Perina (Pierina) in 1562, Ottavia in 1570, and Laura in 1585. Of a daughter named Altura (Alturia) it is known that she was still living in 1645. Marietta, Giovanni Battista, Domenico, and Marco became painters.

The story of Tintoretto's life is not marked by outstanding events. Of the great painters of the Venetian school of the Cinquecento he was the only one born in Venice. Except for a recorded visit to the Gonzaga court in Mantua in September, 1580, and a probable journey to Rome in 1547 (Pevsner, 1928), he did not leave his native town. In a letter written to the youthful Tintoretto in February, 1545, Pietro Aretino touched on his pride and offered him counsel of moderation.

In 1590 Tintoretto's daughter Marietta died. Not long afterward, on May 31, 1594, his own life came to an end. He was buried in the Church of the Madonna dell'Orto.

The stylistic orientation of the art of Tintoretto cannot be understood without reference to the new mannerist movement, of Tusco-Roman and Emilian origin, which between 1530 and 1550 transformed the Venetian tradition (see MANNERISM). The "mannerist crisis," as Coletti (1941) described it, not only influenced Tintoretto but also played an important part in the stylistic development of Titian (q.v.); its new formal solutions undoubtedly conditioned the artistic formation of Paolo Veronese and Jacopo Bassano (qq.v.). In the hands of imitators the Giorgionesque style was taking on a fragmentary neo-Byzantine character — that is to say, an insubstantial two-dimensional decorativeness. The first to react against this tendency were Pordenone and Lorenzo Lotto (q.v.), the former through his Rome-reinforced feeling for plasticity and the latter through his use of color. About 1540, strong mannerist impulses, principally of Mantuan derivation — that is, from the art of Giulio Romano (q.v.) — threatened the integrity of the Titianesque pictorial form. Paris Bordone, Bonifazio Veronese, and Schiavone (Andrea Meldolla) were converted to the new fashion, and the influence of Parmigianino (q.v.), brought to Venice by Schiavone, became an important factor in the genesis of the style of both Tintoretto and Bassano. Francesco Salviati and his pupil Giuseppe (Porta) Salviati arrived in Venice in 1539, the latter to settle there for good. Vasari (q.v.) visited the city in 1541. Giovanni Demio (Giovanni Fratino), who had received his schooling in Rome in contact with the "reformed and archaized Michelangelism" (Lorenzetti, 1926), was a member of the guild of Venetian mosaicists from 1537 on, and his activity in the Veneto was also influential in the formation of Paolo Veronese's decorative landscape.

Aretino, who had been established in Venice since 1527, although at first a lively partisan of the Tusco-Roman style, came to follow the development of Venetian art with deep understanding. In the spring of 1535 he received from Vasari the drawings of the Medici tombs. There was a lively admiration for Michelangelo in Venice. Titian was evidently familiar with his works in the late 1520s. The cult was echoed in the polemic skirmishes that occurred, in the course of a few years, between Paolo Pino (1548), Anton Francesco Doni (1549), and Michelangelo Biondo (1549), culminating in Lodovico Dolce's *Dialogo* (1557), which definitively repudiated Michelangelo in favor of the local idol, Titian. Jacopo Sansovino also established himself in Venice, in 1527, and his classicism, both in architecture and in sculpture, was soon inseminated with the fertile seeds of mannerism. It was certainly he who occasioned the arrival in the Veneto of the Tuscan sculptor Danese Cattaneo, already active in Padua in 1533 (see SANSOVINO). Another who played a part in the transformation of Venetian taste was Bartolommeo Ammanati (q.v.).

The Tusco-Roman and Emilian currents of mannerism thus brought to the spent Venetian tradition expressive means appropriate to new narrative directions. The result is a powerful idiom in which form and color seem to melt in a synthesis dominated by light, with its import of intense spirituality, imaginative and visionary — thence the chromatic lyricism of Titian, the tormented chiaroscuro of Tintoretto, the pictorial classicism of Paolo Veronese, and the luminism of Bassano.

According to Ridolfi (1642), Tintoretto served an apprenticeship in Titian's studio, cut short owing to the master's jealousy of the exceptional achievements of his pupil and to the latter's arrogant disposition. Boschini (1660) repeated the theme of Titian's jealousy. Borghini (1584), for his part, regarded Tintoretto's style as founded on the study of Tuscan formal elements, especially the Michelangelesque, and of pictorial elements derived from Titian. As early as 1548 Paolo Pino had adjudged Michelangelo and Titian to be the two necessary constituents in the formation of the ideal artist. Pino's opinion and Borghini's remarks were undoubtedly the source of Ridolfi's anecdote that tells of the sign which Tintoretto had posted in his studio: "Il disegno de Michel'Angelo, et il colorito di Titiano."

That Tintoretto copied casts of the works of Michelangelo, Jacopo Sansovino, and Giambologna (qq.v.) was a fact too important to have escaped Ridolfi. This practice certainly followed a long and somewhat laborious apprenticeship — that is, only after a grasp of the mannerism of central Italy had made its way into Tintoretto's own style. Ridolfi describes the care with which the artist drew "bodies from life, placing them in various attitudes . . . recording their infinite foreshortenings," and how he "practiced by making little models of wax and clay, dressing them up with bits of stuff and studying carefully the contours of the limbs with the folds of the draperies. Some he also set up in little houses and in perspective scenes made of wood and cardboard, and by contriving little lamps in the windows he introduced therein lights and shadows. He also hung some models by threads to the roof beams to study the effect they made when seen from below, and to get the foreshortenings of figures for ceilings. By such methods he composed strange inventions." The fact that Tintoretto translated his initial concept into plastic terms by means of models, completing it with various light effects, imparted to his compositional solutions their scenographic quality. Once the composition was thus set in its actuality of light and shade, Tintoretto would study the attitudes of the figures from models. This procedure accounts for the unfailing sensitiveness to scenic and dramatic effect that underlies Tintoretto's narrative style: from the relation between figures and setting, resolved luministically, arises the vibrant chiaroscuro that animates his artistic vision.

To judge from the works that can be regarded as dating from the beginning of his activity — the *Virgin between SS. Joseph and Jerome with a Donor* (the donor being the procurator Girolamo Marcello, shown in the act of swearing on the Bible), datable after 1537 (formerly Lucerne, Switzerland, private coll.), and other depictions of the *sacra conversazione* theme — it is clear that, although Tintoretto was not bound to any particular school, he was *au courant* of contemporary Venetian culture and, stimulated by it, drew freely upon it for those elements which interested him. Dated 1540 is a work basic to the understanding of Tintoretto's artistic beginnings — the large *Madonna and Child with Six Saints* (New York, Wildenstein Coll.), earlier attributed to the untraceable Jacopo Molino (Von Hadeln, 1928) but since reclaimed for Tintoretto (Pallucchini, 1950). An affecting wave of movement sways the saints encircling the Virgin, thus creating a rotary rhythm that was to become typical of Tintoretto. In the *Sacra Conversazione* in Berlin (Staat. Mus.) the coloring is deeper and the chiaroscuro heightened, with darker shading in the folds of the draperies and flashes of intense light at the high points. Among the works of this early period are a group of 14 octagonal ceiling paintings of mythological subjects (Modena, Gall. Estense), reaffirmed for Tintoretto by Thode (1901), in which the episodes are depicted with a few figures seen *dal sotto in sù* and with a singular narrative clarity. Also reattributed to Tintoretto is the *Presentation in the Temple* in the Church of S. Maria del Carmelo,

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

Venice, which had been ascribed to him by Venetian sources from Francesco Sansovino (1581) on, though it was given to Schiavone by Vasari. This painting shows considerable lack of proportion in the spatial relationships, but this is compensated for by a narrative urgency that unifies the composition on its various and well-defined planes. In the *Supper at Emmaus* (Budapest, Mus. of Fine Arts) Tintoretto returned to the narrative schemes of Bonifazio Veronese, enriching them with a greater expressiveness of feeling and a dramatic tension released in full motion. This painting has many points of similarity with the *Christ among the Doctors* in Milan (Mus. del Duomo), discovered and published by Arcangeli (1955), who points out its importance in the historical development of northern Italian mannerism.

Ridolfi testified to the fact that from the beginning Tintoretto was active as a fresco painter. The technique of the fresco did play a part in the development of his artistic idiom and certainly fostered the speed of execution that was to become fundamental to his style. Ridolfi also stressed his closeness to Schiavone, recording examples of collaboration, including the works for the Palazzo Zen, where Tintoretto had painted, along with other works, the *Conversion of St. Paul*. Among the more significant works of this period are the six Biblical scenes in Vienna (Kunsthist. Mus.; PL. 78), considered to be by Schiavone until Von Hadeln (ZfbK, 1922) restored them to Tintoretto. In these scenes the narrative impulse prevails. The small figures are drawn with a lively brush, quick to touch the peaks of the draperies with flashes of light: a fresh imaginative inspiration impels them into a variety of attitudes and groupings. These six Biblical scenes, possibly *cassone* panels, are comparable in style to the *Nine Muses* in Verona (Mus. di Castelvecchio), the *Adoration of the Golden Calf* in Vienna (Kunsthist. Mus.), and the *Conversion of St. Paul* in Washington, D.C. (Nat. Gall.), the last-mentioned of quite different proportions. In these works the influence of Parmigianino, by way of Schiavone, works toward painterly solutions modulated to schemes of drawing executed with the tip of the brush and endowed with captivating grace.

There is a neo-Byzantine cadence in this particular period of Tintoretto's work, the culmination of which is surely the *Contest between Apollo and Marsyas* in Hartford, Conn. (Wadsworth Atheneum), painted in 1544/45 (together with a pendant now lost), for a ceiling in the house of Aretino, who thanked Tintoretto for the two paintings in a letter of February, 1545, and commended him for his speed of execution; he recognized the originality of the modes of expression of the young Venetian painter, whose quickness of realization was the manifestation of an inner urgency. Stylistically akin to the *Apollo and Marsyas* is the *Forge of Vulcan* (Raleigh, North Carolina Mus. of Art), and close in date — it can be assigned to 1545 — is the small altarpiece with St. Demetrius and the portrait of Zuan Pietro Ghisi in the Church of S. Felice in Venice.

Between early 1545 and 1547, the year in which the *Last Supper* for the Church of S. Marcuola (PL. 79) was completed, Tintoretto worked toward an ultimate clarification of his aims — his *Kunstwollen*. Weighing all the potentialities of his expressive means, he now attained to a narrative style of high dramatic power, culminating in the *St. Mark Rescuing a Slave* of 1548 (PL. 80). The maturing of Tintoretto's style was probably the result of contact with post-Michelangelesque Roman painting. There is evidence of his having pondered, for instance, on the *Visitation* by Francesco Salviati (IX, PL. 309) in the oratory of S. Giovanni Decollato, Rome, and on Daniele da Volterra's *Deposition*, a fresco painted in 1541 in the Church of Trinità dei Monti, Rome (from which he drew passages, inserting them in the *Deposition* formerly in the Church of S. Francesco della Vigna, a fragment of which painting is in Bridgewater House, London). A hypothetical journey to Rome in 1547 might well account for this tendency in Tintoretto's work and explain his more profound awareness of the post-Michelangelesque idiom. His compositions were thenceforth marked by a more complex spatial articulation, by means of which he achieved the luministic scheme fundamental to the large scenes carried out before 1550.

This new phase of Tintoretto's style had its beginnings with the *Visit of the Queen of Sheba to Solomon* (PL. 80); the versions of *Christ and the Adulteress* in Amsterdam (Rijksmus., Vom Rath Coll.), Rome (Gall. Naz.), and Milan (Pin. Arcivescovile); the *Ecce Homo* in São Paulo, Brazil (Mus. de Arte); the *Crucifixion* in Padua (Mus. Civ.); the *Christ Washing the Feet of the Apostles* in Wilton House, Salisbury (Earl of Pembroke Coll.); and the *Christ in the House of Simon the Pharisee* in the Escorial. In these paintings, for the most part horizontal in format, Tintoretto developed narrative rudiments already present in embryo in the Vienna *cassone* panels (PL. 78), setting them in spaces whose perspective relationships appear highly exaggerated, almost unreal. He was adapting his pictorial means gradually to the narrative requirement: however, the mannerist premises that had gone into his formation as an artist lend his narration a tone that is imaginary rather than naturalistic.

It is probable that the *Christ and the Adulteress* in Dresden (Gemäldegal.), which repeats and develops the compositional pattern of the painting of the same subject in Milan and also that of the *Magdalen at the Feet of Christ* in the Escorial, is earlier by a few months than the *Last Supper* in the Church of S. Marcuola (PL. 79), which was delivered on Aug. 27, 1547. In the *Magdalen at the Feet of Christ* the light goes hand in hand with the compositional effects, controlling and graduating them. This is an unreal and violent light, which gives a distinct relief to the forms and breaks them up into a variety of shapes, thus accentuating, from a chromatic and no longer solely plastic point of view, the sense of restless motion suggested by the mannerist esthetic.

In the Church of S. Marcuola the *Last Supper* was a companion piece to the *Christ Washing the Feet of the Apostles* (PL. 79), now in the Prado, which was bought in Venice in 1649 by Velázquez (q.v.) and installed in the Escorial. In this composition, which brings into focus with a more mature stylistic coherence the subject of the above-mentioned painting in the Pembroke Collection, an unreal light, radiating fanwise, individualizes the various figures; realistically characterized, they, in turn, radiate and spread out from the background to the edges of the picture, where they form lateral groups. As Gould (1962) has noted, the architecture in the background is drawn from Serlio. One of Tintoretto's earliest masterpieces, the *Last Supper* of S. Marcuola is characterized by an agitated chiaroscuro that heightens its dramatic tone. There is no longer the expansive spatiality of the *Christ Washing the Feet of the Apostles*; instead, the frontal disposition of the table, around which the Apostles are drawn close, is severe, almost archaizing. The furiously energetic brushwork, applied in a succession of light and dark areas, produces an effect of continuous movement and almost breaks the compactness of the surfaces, giving this masterpiece the freshness and vivacity that distinguish it. Through his choice of rough and ordinary types, Tintoretto succeeded in imparting to the scene its feeling of normal, everyday reality surprised by the revelation of the miracle.

A painting that should probably be dated slightly earlier than the *St. Mark Rescuing a Slave* of 1548 is the *Esther before Ahasuerus* (Hampton Court, England, Royal Colls.), of which a replica with slight variations is in the Escorial.

The difference in style between the *Last Supper* of S. Marcuola (PL. 79) and the *St. Mark Rescuing a Slave* (PL. 80), painted scarcely seven or eight months later, shows how tirelessly Tintoretto experimented with new ideas. Both Ridolfi and Boschini take note of the tradition recounting the surprise with which the latter painting was received by the public. In April, 1548, Aretino addressed to the artist a letter in which he expressed the fullest praise for the naturalness of the figure of the slave and for the plastic feeling and the drawing, following this with a reservation concerning the hastiness of execution and exhorting him to correct this in the course of time, as though it were a question of youthful exuberance. In any case, Aretino's letter, despite its reservation, gave the stamp of official approval to the fame of the thirty-year-old artist. The *St. Mark Rescuing a Slave* attracted the attention of 19th-century historians to such an extent as to appear isolated from and almost unrelated to the fervent efforts that preceded it. Unquestionably

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

the painting marks the achievement of a style, at once economical and lavish, in which elements found in many earlier works converge. The varied experiments — from the plastic violence of masses in motion, conceived in contrasts of light and shadow, to the flowing painterliness — that abound in this masterpiece are disciplined by a coherence of artistic feeling and welded into an unflawed synthesis.

Tintoretto's interest in portraits, which often found a place in his compositions, has been suggested by the references to the votive painting with the procurator Girolamo Marcello and the altarpiece of S. Felice in Venice with the likeness of Zuan Pietro Ghisi. In the *St. Mark Rescuing a Slave* (PL. 80) appear Tommaso Rangone, Aretino (in profile), and a self-portrait (in three-quarter view). Referring to *The Coronation of Barbarossa* (destroyed), painted a few years later for the Doges' Palace, Vasari noted that the "portraits of noblemen scattered about this scene are very well painted, and brought him fame and general favor." Of the independent portraits, one of the earliest is probably the three-quarter-view *Young Man*, dated 1545, at Hampton Court, England (Royal Colls.). The small portrait in the Uffizi is signed and dated 1546. Stylistically similar are two self-portraits, showing head and shoulders in three-quarter view (London, Vict. and Alb.; New York, M. Ascoli Coll.), both studies painted with extreme vigor, which project a proud and haughty image of the artist. The *Portrait of a Gentleman with a Fur* in Otterlo, Netherlands (Rijksmus. Kröller-Müller), is dated 1547. A more complex work is the *Portrait of a Gentleman with a Fur* (formerly London, Holford Coll.), dated 1548, which is stylistically related to a portrait in New York (Brooklyn Mus.).

The year 1548 was undoubtedly of primary importance for Tintoretto's artistic career. The *St. Mark Rescuing a Slave*, destined to have such clamorous success, signaled the end of a decade of laborious and sometimes audacious experiments. Tintoretto thus came to be compared with Titian, to whom the young painter must have posed something of a threat, both through his way of attracting attention and through being endowed with a talent that could not be overlooked. It must have been Titian's brooding animus that inspired a certain coolness in Aretino, who, although he could boast of having launched Tintoretto in 1545, did not continue to show him the affectionate sympathy of those days. It appears from a letter that Aretino wrote in January, 1548, probably to Domenico Boccamazza, that Titian held Aretino responsible for some fault or omission on the part of Tintoretto. Not the last result of this animus was the negative and disdainful attitude assumed toward Tintoretto by Dolce in his apologia of 1557 in favor of Titian (written in 1555). But other voices had been raised in his favor; Pino (1548), for example, placed him among the "valenti pittori" of the day.

In 1549 Tintoretto completed the altarpiece *St. Martial with SS. Peter and Paul*, begun a year earlier for the Church of S. Marziale, a work less programmatic than the preceding ones and even somewhat conformist. In the same year he also delivered the vast canvas *St. Roch among the Plague-stricken* for the Church of S. Rocco. Giving free rein to his narrative instinct, Tintoretto here spurred his best talents to a treatment of greater boldness and deliberate fantasy. In this painting, "celebre per la rarità della composizione" (Ridolfi, 1642), a twofold light effect again constitutes the fulcrum of the compelling and complicated compositional scheme. To this period belong the altarpieces *St. Augustine Healing the Plague-stricken* (Vicenza, Mus. Civ.) and *Madonna and Child with Saints* (Modena, Gall. Estense); the latter develops the soaring composition of the *St. Martial with SS. Peter and Paul*, but with a more vertical movement. *The Mystic Marriage of St. Catherine* (Lyons, Mus. B. A.) and *The Visitation* (Bologna, Pin. Naz.) can be dated about 1550. In the Louvre *Susanna and the Elders*, of the same period, the landscape setting assumes a dominant part in the composition.

Tintoretto at this time is beginning to give proof of greater subtlety in the painterly quality of his style, as is shown by *The Creation of the Animals*, *The Fall of Man*, and *Cain and Abel*, in the Accademia in Venice, and a fragment of *The Eternal Forbids Adam and Eve to Eat of the Tree of Life*, in the Uffizi — all of which belong to the cycle of stories from Genesis painted between 1550 and 1553 for the Albergo of the Scuola della Trinità. A new cosmic sense of nature reinforces Tintoretto's artistic inspiration: the landscape is not set apart in lyric contemplation, as in the works of Titian (Coletti, 1940), but is colored by the mood of the composition as a whole. From this period onward there crystallized one of the most original aspects of Tintoretto's art, destined later to have decisive importance in the cycle of paintings for the Scuola di S. Rocco.

In light of the paintings for the Scuola della Trinità a better understanding is possible of such works as the *Narcissus* (Rome, Gall. Colonna), to which Wilde (1938), with good reason, likened the *Susanna and the Elders* in Vienna (PL. 78), another of the basic works dating from this phase of Tintoretto's activity. The figure of Susanna is illuminated by a light of crystal clarity and surrounded by a delicacy of details lovingly evoked against an Arcadian background of vernal poesy and freshness. Another painting that can be related to this period is the *Venus and Vulcan* in Munich (Alte Pin.).

In the group of paintings executed in 1553 for the Magistrato del Sale of the Camerlenghi a new direction can be noted. The *St. Louis*, the *St. George and the Princess*, the *St. Andrew and St. Jerome*, and the *Madonna and Child Adored by Four Senators* all reveal a plasticity fully articulated within the close, compact schemes of a manneristic dynamism. This is not a return to earlier tendencies, but an enrichment through new experiments that fructify the earlier ones.

Tintoretto's portrait painting was also in continuous development. The stately portrait of the Soranzo family — the three parts into which this has been divided are in the Castello Sforzesco, Milan — can probably be dated prior to November, 1551. The figures whose appearances Tintoretto sought to capture were aligned on either side of Jacopo Soranzo. The central figure (PL. 77) is superb for the aggressiveness with which the chiaroscuro evokes the physical and moral features of this old man of more than eighty years, giving him the look of one bemused. The three-quarter-view portrait known as *A Young Man Aged Twenty* (formerly New York, Gary Coll.), dated 1551, is close to the *Knight of Malta* in Hampton Court, England (Royal Colls.) and to the *Portrait of a Gentleman* in Oxford (Christ Church Lib.). Among the female portraits also belonging to this period are the *Seated Lady* formerly in the Otto Lanz Collection (Amsterdam, Univ., Kunsthistorisch Inst., on loan from the Dienst voor 's Rijks Verspreide Kunstvoorwerpen), with its waxlike modeling of the lace and embroidery, and the full-face *Portrait of a Lady* in Vienna (Kunsthist. Mus.). The three-quarter-view *Portrait of a Man*, possibly Lorenzo Soranzo, in the same city (Kunsthist. Mus.), is dated 1553; the subject is presented in a monumental architectonic framework that is countervailed by the delicacy of the pictorial relief. Close to this is the *Portrait of a Woman in Black* in Dresden (Gemäldegal.), in which the contrast of the dark, almost black tones of the dress and shawl against the warm complexion and blond hair is resolved in luminous values of flowing softness and of the utmost freshness. Other portraits that date from not later than the mid-1550s are the *Gentleman in a Fur* in Florence (Coll. Contini Bonacossi), the *Portrait of "Carlo II"* in Rome (Gall. Doria Pamphili), and the *Portrait of a Venetian Gentleman* in Dublin (Nat. Gall. of Ireland).

Tintoretto's portraits are very different from those of Titian, in which there is still a Renaissance harmony between man and nature, and man is individualized in all the pride and power of his human and social condition. In Tintoretto such interest flags; he manifests, rather, the need to focus above all on the inward spirituality of his sitters.

It can be said that in the course of a period of fifteen years, from 1539 to about 1554, Tintoretto's artistic personality gradually acquired an individual and well-defined cast that established the premises of all the development that followed. The experiments made during those years were essential to the definition of his style; others were to follow, such as his "Veronesian" phase, stimulated by a passing curiosity, which was not to have any important consequences. Tintoretto gradually

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

came not only to renew from its foundation the idiom of the Venetian tradition but to make of it a receptive instrument for the expression of a visionary and expressionistic fantasy, thus altering the very course of the tradition.

The influence of Veronese, which becomes discernible in 1554/55, is to be found in the great *Crucifixion* for S. Severo and the *Purification of the Virgin* for the Oratorio dei Crociferi, both of which are now in the Accademia, as well as in the *Assumption* in the Jesuit Church of S. Maria Assunta. This was an experiment of short duration, which had the result of separating Tintoretto still further from Titian's tonality. The chromatic orchestration of the *Crucifixion* is akin to Veronese's but the approach to Veronese appears to be more clearly evidenced in the paintings for the Crociferi. The *Assumption* is distinctive for its clear, lucid, and scintillating color, whereas the *Purification* is notable for a perspective scheme that creates an unreal detachment of the grand and imposing foreground figures from those in the background, which are slighter and diminished by the light. The elastic feeling of the spatial relationships grows through the agency of a luminosity that absorbs the reflected color, as in Veronese. Coletti's proposal (1940) to include in this period the ceiling paintings of Old Testament scenes in the Prado, identified by Sánchez Cantón (1952) as the ones acquired by Velázquez for the Spanish royal collection during his second visit to Venice, appears justified. These ceiling panels — *Joseph and Potiphar's Wife* (PL. 81), *The Finding of Moses*, *Susanna and the Elders*, *Judith and Holophernes*, *The Visit of the Queen of Sheba to Solomon*, and *Esther before Ahasuerus* — constitute the most important moment in Venetian mannerism. In them Tintoretto combines a subtle play of color, sparkling with light, modulated in equally subtle linear arabesques. Since these paintings were to be seen from below, Tintoretto gave them the look of weightlessness through the use of open brushwork, so that they retain almost the appearance of sketches in which the effects of improvisation and "non finito" are exploited. Close to the Prado ceiling paintings is the altarpiece with the *Journey of St. Ursula and Her Companions* in the Church of S. Lazzaro dei Mendicanti in Venice (formerly in the Church of the Incurabili): the procession stretches away into an unreal space, and the figures, painted in precious and varied colors, dissolve as they retreat into the background in a diaphanous luminosity. The *Birth of John the Baptist* in Leningrad (The Hermitage) can be related to the above works, both for its chromatic aura and for the grandiose conception of the freely articulated figures.

Whereas in his early works Tintoretto suggested space through rather bare perspective means, in the second half of the 1550s he shifted to constructing scenographic frameworks in which the very crowds of figures, in their choral groupings, accentuate the fabulousness of the space. Among the paintings belonging to this period are the *Moses Striking Water from the Rock* in Frankfurt am Main (Städelsches Kunstinst.), the *Miracle of the Loaves and Fishes* in Florence (Coll. Contini Bonacossi), and a replica of the latter, with numerous variations, in New York (Met. Mus.). In these compositions there is a new "choral" scenic feeling, previously absent from Venetian art: the crowds unwind into the farthest depths of the paintings, fading into the distant atmosphere, in a dynamic tension of the "non finito" — of the sketch — which was to become a salient feature of Tintoretto's later style.

In the sixth decade of the century Tintoretto began his activity for the Church of the Madonna dell'Orto. Mercati (1937) succeeded in tracing the contract, dated Nov. 6, 1551, in which Tintoretto, who had committed himself in 1548 to paint the organ shutters for the church, "with a Presentation (of the Virgin) outside and two figures within," renewed the contract for a payment of thirty ducats, in addition to the amount already received for the original commission. The work was to be completed by Apr. 27, 1552, and the payment was made in installments — in March and November of 1552, in April of 1553, and, finally, in May of 1556. On the outside of the shutters is the *Presentation of the Virgin in the Temple*, on the inside are *St. Peter's Vision of the Cross* and *The Decapitation of St. Paul*. Vasari (1568) admired the *Presentation*, saying that it was "a finished work, and the best-executed and most successful painting" in the church. Coletti (1940) dates the *Presentation* 1552/53, the *St. Peter* and the *St. Paul* 1556. Certainly the two inner panels have a different stylistic character: in the *Presentation* the impression of space is virtually abolished by the steep flight of steps, whereas in the *St. Peter*, beyond the figure of the saint opens an incandescent abyss, partially filled by the Cross, borne by four angels in full flight and boldly foreshortened. Similarly, in the *St. Paul* the unreal light surrounding the angel in headlong flight seems to burst into an illuminated space. Once more, color yields to a luminosity that is transcendent and visionary rather than natural.

The circumstances that accompanied the execution of the organ shutters for the Church of S. Maria del Giglio were similar (Lorenzetti, 1938); according to the initial contract, Tintoretto was to deliver them in 1552, but in 1557 they had not even been begun. Tintoretto was then given an extremely limited time in which to fulfill the contract. On the outside of the shutters he painted a Conversion of St. Paul (now lost; this work was sharply criticized by Vasari) and on the inside the Four Evangelists: SS. Mark and John in one panel and SS. Luke and Matthew in the other, intently writing the Gospels and fantastically seated on dark clouds (PL. 82). The colors are reduced to a bare minimum of values. Tintoretto seems here to anticipate the painterly sensibility of the 17th-century Spanish painters and of the early Manet.

Thus continues the violent, impetuous, seemingly careless mode of setting the scene, enveloping it in a romantic pathos that communicates itself to the viewer, making him share this emotional climate. Tintoretto's conception of space is dynamic; no longer static like that of the Renaissance, his space opens out in all directions, creating the void. As has been justly observed by Rudrauf (1956), Tintoretto's spatial effects are founded on the "sensation de vertige" — that is, on a sense of falling forward, almost precipitously, and of equally swift ascent. Contortion, inversion, foreshortening, the elements of the mannerist syntax of form, impart to the figures a restlessness that accentuates the mobility of his dynamic space.

This aggressiveness of Tintoretto's painting reaches its height in the *Pool of Bethesda* in the Church of S. Rocco, painted in 1559. The *mise en scène* of the episode of Christ healing the sick is one of unprecedented descriptive power. Within a compressed space, the cross-beamed vault, seen in foreshortening, seems to weigh down on and stifle the swarming crowd. Another painting dated 1559, unfortunately in a poor state of preservation, is the *Last Supper* in the Church of St-François-Xavier, Paris, painted for the Scuola del Sacramento of the Church of S. Felice in Venice. The *Deposition* in the Accademia, formerly in the Church of S. Maria dell'Umiltà, reveals the same stylistic qualities as the *Pool of Bethesda* but has a more violent chiaroscuro. More free and luminous than the *Pool of Bethesda* — as, after all, befits the subject — is the *Discovery of the True Cross* in S. Maria Mater Domini (painted for the Scuola del Santissimo, founded 1561), in which certain schemes of mannerist elegance seem to have been revived. Alongside of and contrasting with the idealized figures are some penetrating portraits. There is a tradition (Tietze, 1948) that the *Marriage at Cana* painted for the Refettorio dei Crociferi and now in the Church of S. Maria della Salute bore the date 1561. The setting appears to be rendered according to the perspective methods contrived in the Renaissance; but the result is essentially different in that the space is accentuated, almost multiplied, by the double vanishing point shifted to the left, so that the whole composition appears to center on a prodigious perspective scheme. Besides the large compositions, Tintoretto naturally painted others of smaller format and hence in a slightly different spirit, with greater attention to the rendering of detail. Probably from this period is the *St. George and the Dragon* (London, Nat. Gall.), which can definitely be identified with the canvas in the Casa Correr mentioned by Boschini (1660).

The beginning of the 1560s saw Tintoretto resuming his work for the Church of the Madonna dell'Orto, in which he decorated the choir. Besides the Virtues in the divisions of the apse, he painted two immense canvases: *The Law and the*

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

Golden Calf and *The Last Judgment*. Ridolfi considered these to be youthful works, but the dating of about 1562–63 suggested by L. Coletti (1940) seems more likely. In the first painting the iconographical motifs of Moses receiving the Commandments and the Adoration of the Golden Calf are combined, in the second those of the Last Judgment and the Deluge. Evident in the compositional scheme of the *Last Judgment* are echoes of Michelangelo's Sistine fresco and of Titian's *Triumph of the Trinity* in the Prado, which in no way diminish Tintoretto's originality.

The desire to create an expanding space that stretches deep into the distance in such a way as to invest the event with almost haunting tension is also apparent in the paintings executed after 1562 for the Scuola di S. Marco: *The Finding of the Body of St. Mark* (PL. 83), and *The Translation of the Body of St. Mark* and *St. Mark Rescuing a Saracen from Shipwreck* (Venice, Accademia). On June 21, 1562, the philosopher-doctor Tommaso Rangone of Ravenna, Grand Guardian of the Scuola di S. Marco, asked the plenary assembly to allow him to commission at his own expense the painting of "three pictures of the miracles of our most holy protector St. Mark" (Paoletti, 1929). The canvases by Tintoretto were completed in 1566, the year in which Vasari saw them. In the *Finding of the Body of St. Mark* the sense of the miracle is conveyed by the incandescent lighting of the portico, whose perspective recession intensifies the dynamic impact of the violent chiaroscuro. The *Finding of the Body of St. Mark* was sent to Milan, and the two other canvases underwent various alterations and restorations after the suppression of the Scuola. As can be seen from the engraving by Andrea Zucchi, the *Translation of the Body of St. Mark* was cut on the left and enlarged above and below by the addition of two strips. The cleaning of the picture in 1959 brought to light the pile of wood and a small fleeing figure. The storm that rends the sky, outlining the clouds with light, is the protagonist of the composition, which plays on the contrast between the plastically treated group in the foreground and the farthest planes, where figures and phantoms are evoked as if by sorcery. The third canvas, representing St. Mark saving the Saracen from shipwreck, was also altered by repaintings that modified its luministic impact.

A theme that Tintoretto was increasingly drawn to and explored more and more deeply was the Last Supper. He painted for the Cappella del Sacramento of the Church of S. Trovaso, as he had earlier for the Church of S. Marcuola, a *Christ Washing His Disciples' Feet* (London, Nat. Gall.), which was a pendant to the *Last Supper* painted for S. Trovaso and still *in situ* (PL. 81). Both paintings are datable to the first half of the 1560s. Whereas in the *Christ Washing His Disciples' Feet* (which has been cut at the top) Tintoretto undertook a closed and dramatic chiaroscuro setting, in the *Last Supper* the dynamic space is enhanced by the obliquely placed table, which seems to give a rotary motion to the succession of figures shaped by the light. A popular taste characterizes the *Last Supper* in S. Trovaso: bits of a realism new to Venetian art make their appearance (the rush-bottomed chairs, the still life on the table, etc.). But there is no lack — almost in opposition to this naturalism — of elements of haunting fantasy, such as the small figures in the portico and the woman spinning on the stairs.

Tintoretto was now painting without respite. He had at his command the utmost technical skill, but it was necessary for what A. M. Zanetti (1771) aptly termed his "furioso entusiasmo" to break the deadlock of mere virtuosity before his work could be fully realized in all its artistic power.

In May, 1564, thirty-seven councilors of the Scuola di S. Rocco decided to have the ceiling of the Sala dell'Albergo painted at their own expense. On May 31 it was decided that three or four of the best painters of the day should compete for the commission. Three weeks later Tintoretto offered his oval painting as a gift and, after having put the canvas in place, declared himself ready to execute the other paintings. Vasari's story, though somewhat romanticized, is borne out by the documents. In the central oval of the ceiling is *The Glorification of St. Roch*, which is surrounded by allegorical figures. On the end wall Tintoretto placed the immense *Crucifixion*, dated 1565 (PL. 86). The novel aspect of this particular application of Tintoretto's thematic idiom consists in the organization of space so as to make the Christ on the Cross the central idea around which the whole composition revolves. Three other large canvases line the entrance wall: on the left of the door, the *Christ before Pilate*, one of the most evocative of this series; over the door, the *Ecce Homo*; and to the right, the *Christ on the Way to Calvary*. The *Crucifixion* was paid for by the council of the Scuola; a second payment, dated November, 1565, probably relates to the other canvases, which were apparently completed by 1567.

During the years that Tintoretto was working on the large canvases for the Scuola di S. Rocco he was also engaged on other works. In 1565 he executed the *Resurrection* for the high altar of the Church of S. Cassiano, in 1566/67 the *Last Judgment* (destroyed in the fire of 1577) for the Sala del Scrutinio of the Doges' Palace, and in 1566, for the same palace, the *Madonna Adored by Three Camerlenghi*, now in the Accademia. Another painting of great dramatic effect, also from 1567, is the *St. Roch in Prison*, painted for the Church of S. Rocco, which has the same horizontal format as the *Pool of Bethesda*, painted for the same church in 1559. The angel visiting the saint is a burst of light in the dark prison, and the scene, made up of a succession of episodes, takes on an almost surrealist tone, which is absent from the earlier painting. A similar tonal atmosphere invests the *Descent of Christ into Limbo* (1568) in the Church of S. Cassiano, which centers on the explosive movement of the figure of Christ; passages of powerful realism, such as the portraits of the donors, contrast with pure mannerism, as in the heads of the old men mysteriously shaped by light. The *Crucifixion* (1568) in the same church, painted as a pendant to the *Descent of Christ into Limbo*, has a bold compositional scheme, owing to the three slanting crosspieces and the very low line of the horizon to the right. Another undertaking that was to occupy not a little of the artist's time was the execution of the cartoons for the mosaics of St. Mark's, the first of which date from 1568. The *Last Supper* executed for the Church of S. Polo postdates that painted for S. Trovaso by a few years; profoundly different, it is almost freer than the other in the tempestuousness of the painting, which is characterized by superb passages, especially in the landscape.

The importance of Tintoretto's portrait painting in a survey of his activity has been suggested. The evocative *Portrait of a Gentleman with a Gold Chain* (Prado) has rightly been assigned by Von der Bercken (1942) to the period 1556–60. Shown as though caught by surprise, with the suggestion of a sudden movement of the head, the subject is turned toward the viewer, so that his features, modeled in masterly fashion, are presented to the light. Perhaps also datable to the late 1550s is the haunting portrait of Vincenzo Zeno (Florence, Pitti), shown beside a window through which the last rays of the setting sun are seen flickering over the lagoon. The portrait of Giovanni Paolo Cornaro Hermolai (Ghent, Mus. B. A.) is dated 1561, and the presumed portrait of the procurator Andrea Cappello (Venice, Accademia) dates from no later than 1564. The depiction of Alvise Cornaro (Florence, Pitti) seated in three-quarter view is datable toward the middle of the 1550s. The bust-length portrait of Sansovino (Uffizi) is probably a 1566 work. Between 1567 and 1570 Tintoretto painted the three-quarter-length portrait of Doge Pietro Loredan (New York, Estate of J. R. Delafield), of which there are other versions in Melbourne (Nat. Gall. of Victoria) and Budapest (Mus. of Fine Arts). Tintoretto was gradually supplanting Titian in the painting of court portraits, and characteristically the old Doge is caught in a pose entirely free of stiffness, almost as though he were ready to converse with the viewer. The portrait of Andrea Barbarigo (Richmond, Va., Virginia Mus. of Fine Arts) is dated 1569, and the *St. Mark with Three Procurators* (Berlin, Mus. in Dahlem) can be placed at about 1571. The portrait of Doge Alvise Mocenigo, originally in the Procuratie de Ultra and now in the Accademia, was executed in the latter half of the year 1570, and that of Gabriele Emo, Procurator of St. Mark's (Seattle, Art Mus., Kress Coll.), bears the date 1572. A little later (ca. 1573) Tintoretto executed the large votive painting

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

Doge Alvise Mocenigo and Family before the Madonna and Child (Washington, Nat. Gall., Kress Coll.), in which the Doge, his wife Loredana, his brother Giovanni, Giovanni's sons Tommaso and Alvise, and two of Giovanni's grandchildren are grouped symmetrically on either side of the Madonna and Child. In choosing such an arrangement Tintoretto seemed to want to give the group an iconic character, while avoiding any old-fashioned suggestion of the hieratic. The vision of the Madonna and Child is felt as a presence amid the group, who do not turn toward her but look out of the picture, so that the scene takes on an air of almost affectionate familiarity. The most lifelike touches are the portraits of the two young men, Tommaso and Alvise, with their contrite demeanor. This painting epitomizes that transformation of Tintoretto's portraiture which brings his personages, even when attired in accordance with their rank, so close to the modern sensibility.

In Tintoretto's subsequent portraits, throughout the 1570s, the search for spiritual characterization intensified. A series of portraits of old men, including the *Bearded Man with a Fur* (Vienna, Kunsthist. Mus.), the *Portrait of a Venetian Senator* (Prado), and another portrait of the same subject (formerly Richmond, Surrey, Cook Coll.), seems to evoke the twilight of the Venetian civilization of the 16th century.

Discernible in the series of five philosophers painted in 1571/72 for the Libreria Marciano — in the graceful rhythm of the figures — is a mannerist reprise, which also accounts for the refined draftsmanship of the *Christ in the House of Martha and Mary* of the previous decade, painted for the Dominikanerkirche in Augsburg (PL. 84).

The importance of the landscape in the above-mentioned votive painting of Doge Alvise Mocenigo and his family should be mentioned. Such passages are not uncommon in this particular phase of Tintoretto's activity — suffice it to mention the landscape seen beyond a ruined arch at the foot of Golgotha in the *Resurrection with Portraits of Ottaviano Valerio, Francesco Pisani, and Michele Bon* in the Doges' Palace (ca. 1571); the splendid alpine scene that forms the setting of the *Madonna Appearing to St. Jerome* (Venice, Accademia), dated 1570–76 by Von der Bercken (1942); and the evocative background of the *Madonna and Child* in San Francisco (Calif. Palace of the Legion of Honor). Other paintings that can be assigned to the period 1570–75 are the *Madonna in Glory* (Florence, Pitti), the *Madonna Appearing to the Evangelists Luke and Mark* (Berlin, Mus. in Dahlem), and a votive altarpiece, *The Cornaro Family Adoring the Virgin* (Edinburgh, Nat. Gall. of Scotland).

In 1576 Tintoretto returned with renewed zeal to the decoration of the Scuola di S. Rocco. It had been decided in 1574 to renew the ceiling of the large upper hall, and in 1575 Tintoretto was asked to provide "the central panel"; this painting, *The Erection of the Brazen Serpent*, was completed on Aug. 16, 1576. On Jan. 15, 1577, Tintoretto offered to paint two other canvases for the ceiling: *The Gathering of the Manna* and *Moses Striking the Rock*. On March 22 of the same year Tintoretto promised to paint the rest of the ceiling, namely the ten oval and eight rhomboid chiaroscuro panels (repainted by Giuseppe Angeli in the 18th century). On November 27 he decided to amplify the original program and promised to supply the ten paintings for the walls and the altarpiece. All were completed by September, 1581, except the altarpiece, which was delivered in 1588. Tolnay (1960) says of the decoration of this hall that "it consisted in the unfolding and amplification of a central idea, as opposed to the illustration of a program systematically elaborated from the start." The large rectangular central painting, *The Erection of the Brazen Serpent*, contains in embryo the entire decorative program for the hall, which was later developed into a cycle depicting the miráculous salvation and healing of suffering humanity. The Old Testament scenes depicted in the ovals are logically linked to the main paintings in an intricate network of allusions that also comprehends the paintings on the walls.

Compared with the Sala dell'Albergo, where the composition has a precise spatial definition and the color an outstanding richness of Venetian values, the large upper hall shows a reduction of the colorism in a much more emphatic chiaroscuro. The movement is more convulsive, and it pleased Tintoretto's fancy here to evoke dramatic scenes positioned in a multiplicity of spaces and dissolved in vortices of light. The canvases on the walls, which deal with the life of Christ, are, starting from the left on the wall opposite the entrance, *The Nativity* (PL. 87), *The Baptism of Christ*, *The Resurrection*, *The Agony in the Garden*, and *The Last Supper* (XII, PL. 93); on the opposite wall are *The Miracle of the Loaves and Fishes*, *The Raising of Lazarus*, *The Ascension*, *The Pool of Bethesda*, and *The Temptation of Christ*. For inspired imagination and poetic spirit these scenes are among the most sublime of Tintoretto's career. In the *Nativity* he aims at an instantaneity of movement combined with a multiplicity of scenes, separating the work into two superimposed planes. The *Baptism of Christ* — through its incredible atmosphere, flashing with lights, in which the crowd winds along the banks of the Jordan — breathes an exalted lyric inspiration. More prosaic compared to these, the *Last Supper* is set in an obsessive perspective scheme that serves to enhance the dramatic rhythm. The *Ascension* remains one of the most spontaneous and visionary scenes that Tintoretto conceived, with its effects of perspective reversal, in which Christ, ascending into the heavens, borne by angels whose wings slash the shadowed spaces with saber cuts of light, seems to advance toward the viewer, while on the ground in the distance two Apostles, of scarcely corporeal substance, are conjured up in incandescent filaments of light.

Earlier, in the *Raising of Lazarus* in the Katherinenkirche, in Lübeck, signed and dated 1576, boldly perspective compositional motifs are introduced, so that the figures appear to mount into space; just such motifs occur in the large canvases of the upper hall of the Scuola di S. Rocco — for instance, in the moving *Temptation of Christ*. In the *Temptation of St. Anthony* (1577) in the Church of S. Trovaso there is a return to the motif of a concentric movement that pivots on a central axis. Possibly slightly later in date is the *Capture of St. Roch* in the Church of S. Rocco; only the "furioso entusiasmo" of Tintoretto could have left the imprint of such a vigorous imagination on the scene of the saint taken prisoner at the gates of his native town, Montpellier, while the battle rages. The subject seems to have involved the artist emotionally, arousing his creative enthusiasm; when, on the contrary, the motivation of a subject in the popular or romantic vein is lacking, Tintoretto's style grows more subdued, being embodied in compositions tending toward the structural and the plastic. Thus some of Tintoretto's works are imbued with conventional feeling and weighed down by an academic polish, however much veiled by clever and prestigious mannerist devices. The four secular allegories (*Ariadne, Bacchus, and Venus*; *Pallas Athene and Mars*; *Mercury and the Three Graces*; and *The Forge of Vulcan*) completed in 1577 for the Sala dell'Anticollegio of the Doges' Palace, the *Moon and the Hours* (formerly Berlin, Staat. Mus.; destroyed) of 1580 or a little later, and the *Allegory of Music* (PL. 85) are all fairly typical examples of this tendency. The *Origin of the Milky Way* (London, Nat. Gall.), with its brilliantly luminous space, also belongs to this phase. Probably executed shortly before 1579 and in 1579/80, respectively, were the two cycles of the eight Gonzaga *Fasti* in Munich (Alte Pin.). Commissioned by Guglielmo Gonzaga, these complex battle scenes, structured by perspective networks that multiply in an expanding space, are painted with great skill, particularly in the light-blurred backgrounds. It is natural that Tintoretto should have had assistance from his workshop — though hardly from Pozzoserrato, as suggested by Coletti (1941) — in this series of canvases, which follow a precise commemorative program. The group of works in the Church of S. Stefano (formerly in S. Margherita) — *The Last Supper*, *Christ Washing the Feet of the Apostles*, and *The Agony in the Garden* — is related from the point of view of iconography to the compositions for the large upper hall of the Scuola di S. Rocco.

Tintoretto's activity in the eighth and ninth decades of the century was continuously on the increase. Judged by the proportions of the canvases, his working capacity was astonishing. But it is evident that it was only with the aid of his workshop that he was able to bring all these works to completion. Cer-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

tainly his sons helped him, starting with Domenico, who by 1577 was Sindaco of the Scuola dei Pittori. Ridolfi (1642) affirms that about 1588 Domenico worked with his father on the *Paradise* for the Doges' Palace; Marietta could also have been of assistance, as could his son Marco (whose stylistic traits are difficult, if not impossible, to establish). Other artists who probably collaborated with Tintoretto were Antonio Vasilacchi (Aliense), Andrea Vicentino, Paolo Fiammingo (particularly in the landscape backgrounds), and Lambert Sustris (who imitated his style of portraiture).

Tintoretto's works for the Doges' Palace cannot be considered particularly successful, since they are for the most part burdened by an extraneous narrative requirement. In these terms Tintoretto appears to have been responsible for a certain illustrative and commemorative style that brought on a crisis in Venetian painting in the last quarter of the century, when La Serenissima (the Venetian Republic), after the Battle of Lepanto and the fire of 1577, was moved to decorate some of the rooms of the Doges' Palace with paintings exalting her political and religious triumphs. Between 1578 and 1581 Tintoretto painted on the ceiling of the Sala delle Quattro Porte the circular fresco *Juno Bestowing the Peacock on Venice* and four medallions with allegorical figures. In a number of paintings the preponderant intervention of collaborators diminished the vitality of Tintoretto's structural foundations. To be numbered among such works are the series of votive paintings with the doges Andrea Gritti, Francesco Donato, Nicolò da Ponte, and Alvise Mocenigo (the *modello*, or preliminary sketch, for this last is the *Doge Alvise Mocenigo Presented to the Redeemer*, an unfinished painting of high quality in the Metropolitan Museum, New York). These votive works were painted for the Sala del Collegio between 1581 and 1584 to replace those destroyed in 1577. Also in this category are the ceiling panel *The Triumph of Venice as Queen of the Seas*, datable between 1581 and 1584, and the two large canvases *The Dead Christ Adored by the Doges Lando and Trevisan* and *Doge Loredan before the Virgin*, all in the Sala del Senato; the ceiling panels *The Defense of Brescia*, *The Battle near Riva*, and *The Battles of Argenta and Gallipoli*, painted for the Sala del Maggior Consiglio before 1584; the ceiling panel *The Triumph of Doge Nicolò da Ponte*, painted for the Sala del Maggior Consiglio, and *The Battle of Zara*, painted for the Sala dello Scrutinio, both before 1585; and, finally, the canvas *The Venetian Ambassadors before Barbarossa*, painted for the Sala del Maggior Consiglio between 1584 and 1587. Another circumstance to be borne in mind in connection with the works in the Doges' Palace is the lack of discrimination of restorers, which has left its systematic and deplorable mark. The enormous *Paradise*, which was superimposed on a fresco by Guariento (ruined by the fire of 1577) in the Sala del Maggior Consiglio, has a compositional scheme of vast scope, but the cleaning carried out in 1941 has clearly revealed a discontinuity in its figural fabric, attributable to intervention of more than one hand. The idea of encircling Christ and the Madonna with a rosette of colors, which stand out from the firmament in their continuous alternation of luminous contrasts, is one that creates a splendid effect. The *modello* in the Louvre — a document of exceptional pictorial freshness — was presented for the competition held in 1579, two years after the fire that destroyed the decoration of the Sala. The large canvas, begun after that year, was painted in sections at the Scuola della Misericordia, as Ridolfi testifies; it must have been completed by 1587, the year in which G. Bardi erroneously attributed it to Veronese and Bassano.

The *Battle on Land and Sea* ("The Rape of Helen"; PL. 85), though reminiscent of the schemes of the Gonzaga *Fasti* and of the battle scenes in the Doges' Palace, recalls the atmosphere of the paintings of the ground-floor hall of the Scuola di S. Rocco. The subject, pictured in the middle distance with brushwork of the utmost boldness, is the start of a battle fought on land and sea with savage fury. In these last years the idiom of Tintoretto actually attained new heights, involved as it was in a pursuit that created the most visionary and expressionistic facet of 16th-century Venetian art. It must be acknowledged that Tintoretto dedicated the best of himself to the Scuola di S. Rocco, jealously excluding collaboration except in minor parts. In the large canvases executed for the lower hall between the latter half of 1583 and August, 1587, Tintoretto still had something new to say: volume and color appear understated; the figures become incorporeal, disembodied beings improvised by the imagination; light dominates in its most lyric aspect, dissolving the color in flashes of diaphanous brushstrokes; and space is amplified in a succession of limitless perspectives. Boschini (1660) called the *Adoration of the Magi* "un gran concerto"; each compositional element is indeed subordinated to the musical effect of the contrasts of shadow and light, down to the fantastic apparition of the procession of the Magi. In the *Flight into Egypt* (PL. 88) the landscape predominates: the group of figures appears to come out of the scene (depicted in an elastic space), leaving behind a marvelous landscape seen through wings of foliage and palm trees, shimmering in the incandescent light of sunset. Here the landscape is truly the projection of an emotion. In the *Massacre of the Innocents* a profoundly dramatic inspiration animates the convulsive, rotating brushwork, creating one of the most anguished and haunting scenes in Italian painting. Two gems of the ground-floor hall are the *St. Mary Magdalen* and the *St. Mary of Egypt* (XII, PL. 372), in which the small figures lost in vast landscapes, the tree trunks, the streams of water, the contours of the hills, and the cottages are alight with reflections and glimmerings; things breathe a fantastic life of their own in an atmosphere of hazy incandescence.

According to Tolnay (1960), Tintoretto's cycle of paintings in the Scuola di S. Rocco may be considered the most representative work of the "Catholic reformation" — not the reformation imposed from above, but that which was nourished by a feeling deeply rooted in the popular sentiment. The miraculous element that Tintoretto introduced into his compositions in S. Rocco was also fundamentally related to the stylistic and visionary trends of mannerism.

The last works of Tintoretto do not reach the expressive fullness and absoluteness of those of the ground-floor hall of S. Rocco. In the six scenes from the life of St. Catherine (restored) in the Venetian Church of S. Caterina the extraordinary rapidity of composition is not translated into rigorously coherent terms, possibly on account of the participation of the workshop. The better paintings are certainly the *Capture of St. Catherine* and the *Martyrdom of St. Catherine* (PL. 88), in which the imagination of the artist bursts forth in all its expressionistic violence.

Probably works of the latter half of the 1580s are the *St. Michael Slaying the Dragon* (Dresden, Gemäldegal.), the *Flagellation of Christ* (Vienna, Kunsthist. Mus.), the *Martyrdom of St. Lawrence* (Oxford, Christ Church Lib.), and the *Samson and Delilah* (Derbyshire, Eng., Trustees of the Chatsworth Settlement). Tintoretto's son Domenico has been thought of in connection with certain of these works, but their quality rules this out. However, there is no doubt that the hand of Domenico predominates in the *Adoration of the Magi* and the *Expulsion of Joachim from the Temple* in the Church of S. Trovaso. Certainly more notable in their spatial and luministic premises are the grandiose canvases of the presbytery of S. Giorgio Maggiore (under construction in 1589), which were completed in 1594 (and paid for with the sum of 180 ducats). In the *Last Supper* two separate streams of light divide the huge bare room in which Christ is intent on administering communion to the Apostles; a real light is diffused by the lamp, striking the figures from behind, while around the head of Christ radiates a phantasmal refulgence, and it seems almost as if the angels descending from above are of the same luminous stuff. The everyday realism, with its almost commonplace flavor, is transfigured by the contrast of this double light in an almost expressionistic manner. Similarly, in the *Entombment* in the chapel of the same church, for which Tintoretto was paid 70 ducats in 1594, this twofold luminism — the natural light of the sunset on the horizon and the phantasmal light striking the figures — emphasizes the positioning of the groups in the fragmented space. This may be considered the last work painted by Tintoretto.

As is well-known, Tintoretto's graphic works, of which about a hundred examples survive, are fundamental to an understanding of his art. With rare exceptions, he left no comprehensive studies for his compositions. He was in the habit, as has been said, of preparing the imagined situation by means of artificially illuminated little stages peopled by wax figurines; then he would concentrate on studying the individual figure, mostly from the model, placing it in the most varied attitudes, according to the compositional necessities suggested by the prearranged scenic invention. These drawings consequently bear the stamp of intimate and personal exploration; transcribing his immediate impressions of reality, Tintoretto was able to impart to them a poignant freshness of expression (IV, PL. 277). Only his mannerist training, of which we have followed the early development, could have enabled the Venetian painter to overcome all restricting naturalism. It was Von Hadeln (1921, 1922) who grouped together some early drawings of sculptural groups and antique and contemporary casts, to which a few others have since been added. In this numerous and homogeneous group of drawings — some of which are devoted to the same statue as seen from different angles — the drawing of the piece is not an end in itself, that is, a lifeless classicist performance, but the occasion for originating lively chiaroscuro effects. The choice of sculpture as models — whether Michelangelesque casts or antique and modern sculptural groups, complexes of attitude and movement — demonstrates a distinct tendency toward figural elements of mannerist construction. These "conglomerates," as Von Hadeln (1922) calls them, whose complex and tormented plasticity is additionally subjected to violent illumination, must have been highly significant in the formation of the young artist's style. A thick black chalk stroke, curved and hammered, delimits the forms in a contour that emerges broken, disconnected, and blurred.

Most of these drawings, after casts and statues, can be placed in the latter half of the 1540s. From the first years of the 1550s Tintoretto made more varied use of the graphic medium, both in drawing directly from the life models, as would seem to be proved by the study in the Louvre (Cab. des Dessins) for the *Susanna and the Elders* in the same museum, and in drawing studies for entire compositions, such as the one in Berlin (Kupferstichkabinett) for the *Vulcan and Venus* in Munich (Alte Pin.). From these more closed and heavy exercises in form the artist passed on to the realistic rendering of motion suspended in mid-air, caught unfolding in an articulated course of action, with a synthesis that in modern times only Degas succeeded in rediscovering. Tintoretto's drawing, straining to capture the muscular tension of the human figure in space, does not seem to be related to his time in its striving after mannerist abstraction. The drawings of the last decades are wanting in chiaroscuro, becoming progressively reduced to open and broken contours.

The agreement and disagreement among contemporaneous critics regarding the young Tintoretto has already been touched on. All later historians, from Vasari onward, have picked up the critical cue contained in the above-mentioned letters of Aretino (1545, 1548), which serves as a positive or a negative argument according to the perspective of taste. Francesco Sansovino (1556) developed a similar theme with more conviction, characterizing Tintoretto's temperament as tumultuous and romantic. Apparently for a Tuscan like Vasari, even more than for Aretino, who had settled in Venice, Tintoretto's art was difficult to understand. But, although Vasari did not take in the originality of Tintoretto's painterly luminism, he gave evidence of sensing his expressionistic tension when, almost despite himself, he allowed this statement to escape him: "In painting, however, he showed himself eccentric, fanciful, quick and resolute. He possessed the most stupendous brain that painting has ever known. . . ." The position of Borghini (1584) in regard to Tintoretto is noteworthy, since he was able to define two component elements in the formation of the artist: the study of Tuscan formal elements and the recognition of the validity of the Venetian pictorial tradition, especially that of Titian. The Veronese critic Cristoforo Sorte (1580) was aware that Tintoretto's rapidity arose not from poor technique but from particular spiritual attitudes, which expressed themselves in luministic effects. Lomazzo (1584, 1590) saw in Tintoretto not only "l'uomo raro nell'universale armonia del disegno" but also the painter of light, in love with backgrounds dazzling in their brightness, and the portrait painter of eternal fame.

Art historians of the 17th century present a more lively critical understanding of Tintoretto, owing especially to the two Venetians Carlo Ridolfi and Marco Boschini. Ridolfi's unbounded admiration was not, unfortunately, founded on critical grounds, and the interest of his biography of Tintoretto, published in 1642 and later included in his work *Le maraviglie dell'arte* (1648), is purely historical. However, there is no lack of remarkable sallies: "His brush was a thunderbolt that struck terror into all with its flash." Also interesting is the objection that he felt himself bound to express before so vast a production: "He often abused so great a talent, devoting himself to painting in every style." Quite differently motivated is the enthusiasm of Boschini. His anti-Vasarian attitude is well known, and his defense of Tintoretto is therefore, in a certain sense, to be discounted *a priori*. But Tintoretto was for Boschini something else: he was perhaps the Venetian painter closest to his heart, precisely because he felt him to be so close to his own exalted baroque sensibility. In *La carta del navegar pitoresco* (1660), with an altogether direct critical judgment before Tintoretto's works, Boschini threw into relief their salient stylistic characteristics. With a few strokes, in words not devoid of baroque conceits and sometimes of an effective *vis poetica*, he emphasized Tintoretto's inventive power, his luminism, and his rapid touch. In *Le ricche minere* (1674) Boschini praised Tintoretto as the painter who had an "assoluto dominio della Arte." An interesting observation was made by De los Santos (1657) in regard to the *Christ Washing the Feet of the Apostles* (PL. 79), then in the Escorial; in pointing out the spatiality, he noted that the color and perspective scheme "give the impression that air is circulating between the figures." In France, Félibien (1666) spoke of Tintoretto without much conviction but not without appropriate comment, such as the remark that he "considered white and black were the two most precious colors that a painter could make use of." But it was R. de Piles (1699) who came closest to the artist, with a critical attitude that could be termed Boschinian. In Tintoretto's style he sensed the importance of movement, realized not so much in the individual attitudes of the figures or in the general compositional effect as in the "grandes glissades" of light and shadow that disentangle themselves as they jostle one another in opposition and are caused by a source presumed to be outside the painting.

Genuine admiration was expressed by Palomino de Castro y Velasco (1715–24): "His paint was laid on with an unequaled boldness. . . . He was fired to great ideas and his extraordinary conception was always accompanied by a great taste for color, with attitudes astonishing in their effect." Cochin (1758) was aware of the grandeur of Tintoretto's works, which were "executed with all his zeal." Earlier, D'Argenville (1745–52) had said, "He is the most fertile genius we have in painting; a large work took him less time to paint than for another to invent." Though Antonio Maria Zanetti occupied an important place in the sequence of Venetian art history, his taste, permeated with classicism, was not the most attuned to the understanding of Tintoretto's genius. He responded, however, to the tumultuous fantasy of the painter and singled out its expressive means as residing in his "outstanding use of light and shadow." Though he had credited the painter with "furioso entusiasmo," he subsequently deplored the fact that this enthusiasm had carried Tintoretto's spirit beyond the limits "della verità e del verosimile." Zanetti expressed other reservations as well about Tintoretto's works, so that his attitude emerges as more negative than positive, and its influence on later art historians was not negligible. Lanzi (1795–96) admired Tintoretto, but his esthetic judgement was obstructed by the current rationalistic and neoclassic taste. For Lanzi, too, Titian remained the unsurpassed model, so that every opinion on Tintoretto was referred to this standard. Mengs (1780) earlier expressed the same judgment, preferring Titian to Paolo Veronese and the latter to Tintoretto.

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

The return in the 19th century to a taste for works in line with the romantic esthetic might have been expected to arouse more direct support of Tintoretto's art, but this was not the case. Nevertheless, the 19th century exceeded the previous century in the laborious task of salvaging Tintoretto's artistic personality. Rio's emphasis on content (1836) was more an impediment than otherwise to the understanding of the painter, whom he considered to be impetuous, violent, too prolific, and hence irreligious and irreverent. More important was the attitude of Blanc (1868), who although his thinking lacked a coherent base, deserves credit for having approached the painter with freshness of judgment. Gauthier (1875) frankly admired Tintoretto's dramatic ardor, and the admiration of H. Taine (1884) was still more candid. New, too, was the position of Ruskin, who preferred Tintoretto to Michelangelo as a great colorist. For Ruskin, Tintoretto had an intensity of imagination realized in effects of "illuminated color," capable of attaching to the commonest subject a "range of suggestiveness almost limitless." Ruskin's enthusiasm went so far as to cause him to prefer Tintoretto to Titian. Free of any classical or academic bias, Ruskin realized in Tintoretto his own romantic ideal. Berenson (1894) may be said to have followed in Ruskin's path, but with an emphasis on the importance of the artist's Venetian training. Burckhardt (1855), although recognizing certain of Tintoretto's qualities, evidences a deep aversion to the artist: "There is a certain crudeness in him, a barbaric sensibility: even his artistic morality often wavers, so that we see him abandoning himself to the most shameless superficiality." But this judgment is modified when he scrutinizes the individual works. An unprecedented stand is that taken by Wickhoff in connection with his study of the Vienna Genesis (1895), where he cites Tintoretto as one of the most significant exponents of illusionistic painting of modern times. Thode's monograph dedicated to Tintoretto (1901) can be said to complete the long and tortuous course of 19th-century criticism. The first complete study of the artist's work, it has the merit of presenting with clarity the critical problem of the ascendancy of light over form and color; through this new stylistic element Tintoretto achieved "the spiritualization of reality."

In the 20th century the scholarly problem of the reconstruction of Tintoretto's artistic activity proceeds *pari passu* with the critical rehabilitation of his personality. In England, Stoughton Holborn (1907) in his enthusiasm seems to follow Ruskin, and Phillipps (1911) and Osmaston (1915) are not far removed. To modern German historiography goes particular credit for historical and scholarly groundwork in connection with Tintoretto's art; D. von Hadeln, E. von der Bercken, A. L. Mayer, and H. Tietze have made notable contributions in this direction. The critical point of view from which the German scholars start is expressionistic. Von der Bercken and Mayer, in their monograph of 1923, deny that the direction of Tintoretto's vision was naturalistic, stressing its *terribilità* and thus putting the emphasis back on the content of his art.

A new position was that of Max Dvořák, who, in his university courses given at Vienna between 1918 and 1921, declared Tintoretto "next to Michelangelo, the major exponent of Italian mannerism, and his true spiritual successor, despite his Venetian training." Whereas the earlier historiography of art, especially that of Venice, had sought to glorify Tintoretto's Venetian sense of color, Dvořák acclaimed him because by underplaying color he derived from it another principle, that of light, a stylistic means capable of expressing deeply spiritual and religious content. Tietze (1948), on the other hand, developing the thesis of Thode, justly emphasized not only the concept of motion and space but also of theater in the compositions. Vipper (1950–51) sought to interpret Tintoretto's art in its social context; notwithstanding the special perspective of his criticism, he succeeded in bringing into focus the relation between the master's art and the society of his time.

The contribution of Italian criticism in the first half of this century to the study and clarification of Tintoretto's artistic personality has been substantial. Still a fundamental work, Pittaluga's monograph (1925), taking up Thode's concept, asserts that Tintoretto had renounced his purpose of reconciling Michelangelesque form and Titianesque color, aspiring rather to "fuse the two principles one into the other, altering and transforming them to achieve a synthesis. The means of the fusion was light." Through this luministic factor Pittaluga explained the rapidity of Tintoretto's vision, from which in turn the effect of motion was derived. Also fundamental is Coletti's critical study (1940), which, following the artist's adventurous stylistic career, seeks to define his painterly, poetic, and human values. Coletti, starting from Dvořák's insight, established in precise terms the effect of the mannerist culture on the formation of Tintoretto, a thesis taken up again and fully developed by others (e.g., Pallucchini, 1950). Longhi (1946) is restrained in his appraisal of Tintoretto's works. He does not deny him "a nature touched with genius, overflowing from the beginning with the most beautiful ideas for dramatic tales that unfold within a setting of rapidly shifting shadows and lights"; but he expresses reservations on the programmatic way in which Tintoretto realized these ideas, resolved as they were on a level of ever-increasing virtuosity, and he concludes that "the most living phase of Tintoretto's art, precisely because it is the least *furioso*, is that of his youthful experimentation." Both Arcangeli, in a special study on Tintoretto (1955), and Chastel, in his outline of Italian art (1956), definitely include the figure of Tintoretto in the phenomenon of mannerism, thus agreeing with the thesis of Coletti and Pallucchini. In another work of 1956, Sypher makes a contribution to the comprehension of mannerism, centering on Tintoretto a whole series of keen observations, both on his style and on the relation of his style to his time.

Art history has traversed an arduous path to reach an understanding, or rather a bringing into focus, of the complex world of Tintoretto. The relativity of taste has conditioned its interpretation; but by taking into account these varied and often contradictory attitudes it is possible to arrive at a more informed evaluation and to obtain a clearer image, in all its problematical profundity, of the personality of one of the greatest and most significant figures of modern European painting.

Illustrations: PLS. 77–88.

TITIAN. Italian painter (b. Pieve di Cadore, ca. 1488–90; d. Venice, Aug. 27, 1576). The history of Titian's family, the Vecellios, has been traced back (Fabbro, 1951) to a certain Tommaso, a notary from Pozzale di Pieve di Cadore, one of whose sons, called Guercello or Vecellio, was podesta of Cadore in the first half of the 14th century; it was from him that the family derived its surname. Titian was one of the five children of Gregorio Vecellio and grandson of Count Vecellio, a notary and jurisconsult. The exact year of Titian's birth is unknown. The traditional date of 1477 given by the Anonimo del Tizianello (1622) and Ridolfi (1648) has now been rejected by scholars in favor of the evidence of Dolce (1557) and Vasari (1568), who place it around 1488–90.

Little is known of Titian's beginnings as a painter. According to Dolce, he was sent at the age of nine to the home of an uncle in Venice, where he worked in the studio of Sebastiano Zuccato, father of the well-known mosaicists Valerio and Francesco. This early contact with the technique of mosaics may well have influenced Titian in his use of color. His relations with the Zuccato family continued for many years; as late as 1545 he gave Valerio a design for a mosaic in the Basilica of S. Marco, and in 1565 their names are again recorded together in connection with the frescoes for the archidiaconal church of Pieve di Cadore.

According to tradition, Zuccato entrusted the young Titian to Gentile Bellini, who was then working with his brother Giovanni in the Sala del Maggior Consiglio in the Doges' Palace. However, since Gentile's style seemed too "hard, dry, and labored" (according to Vasari), Titian is supposed to have turned instead to Giovanni, who at that time embodied more than any other painter the pictorial ideals of the age and held a position of indisputable supremacy in Venetian painting. It was from Giovanni Bellini that Titian acquired the taste for tonality and the poetic sense of landscape that he was to see realized and made sublime in the works of Giorgione (q.v.). In Giorgione he found his ideal teacher, and to him he turned — probably in the years immediately preceding their collaboration on the frescoes for the façade of the Fondaco dei Tedeschi — for an apprenticeship that was of fundamental importance to the development of Titian's art. He absorbed Giorgione's teachings and his magic world to such an extent that Titian's paintings were sometimes mistakenly believed to be works by his master, even during the latter's lifetime (Vasari).

This affinity between the two artists constitutes a fascinating, complex, and hotly debated problem. The certain authorship of a group of works attributed by some scholars to Giorgione's last years and by others to Titian's early period would be of fundamental importance to our understanding of the two artists. Another problem is the influence of Titian's elder brother Francesco, a modest artist, who nevertheless should not be lost sight of in the reconstruction of the general framework of Titian's early development. In any case, it was incontestably from Giorgione that Titian learned a new way of painting, released from traditional schemes, with rapid brushstrokes dissolving the outlines to create a sense of volume — essentially a new pictorial vision, more immediate than reflective, based not only on a technique that was revolutionary and nonconformist for that period but also on a particular way of feeling nature and created things, interpreted as an inexhaustible source of arcane enchantment.

After drawing and painting with Giorgione for a short time Titian had become so skillful (Dolce) that when the master was commissioned to fresco the Fondaco dei Tedeschi in 1508 he held his young pupil worthy to paint at his side. The façade was frescoed by Giorgione and the side facing the Mercerie by Titian, thus confirming the evidence of Dolce and Vasari. According to the latter, Titian received the commission from the nobleman Barbarigo, of whom he had painted a portrait in about 1506; if this portrait, identified by some critics with the so-called "Ariosto" (London, Nat. Gall.), had not carried "his name on the dark background, it would have been attributed to Giorgione." Again, when Titian's frescoes were unveiled, they were thought by some to be by Giorgione himself and were so highly praised that the master finally took offense, even though he recognized that his pupil "was a painter even inside his mother's womb" (Dolce).

These frescoes, which had already deteriorated in Ridolfi's day (1648), were almost unrecognizable when they were detached in 1937. Two fragments survive: Giorgione's *Nude* (VI, PL. 189) and Titian's *Compagno della Calza* in the Doges' Palace in Venice. A few figures are recorded in engravings executed by Gian-Jacopo Piccini in 1658 and in those by Antonio Maria Zanetti which are included in his *Varie pitture a fresco de' principali maestri veneziani* (1760). From the engravings it can be seen that Titian's figures have a greater sense of volume and plasticity and that the enraptured quiescence of Giorgione's art is replaced by an internal intensity. The Fondaco frescoes constitute a turning point in Titian's youthful activity, dividing his strongly Giorgionesque works from those in which his own pictorial style finds personal expression.

After the collaboration on the Fondaco dei Tedeschi, relations between the two artists probably slackened or dissolved completely, and Titian, by now publicly acclaimed, began to work alone. In 1510, the same year Giorgione died, Titian was commissioned to paint frescoes for the Scuola di S. Antonio in Padua.

Among Titian's earliest works are two *cassone* panels, the *Birth of Adonis* and the *Myth of Erysichthon*, in the Museo Civico of Padua, which are very free in technique and of great coloristic intensity and expressive force. Stylistically similar is the furniture panel *Endymion and His Flock* of the Barnes Foundation in Merion, Pa., which most likely immediately precedes the *Orpheus and Eurydice* of the Galleria dell'Accademia Carrara in Bergamo, a painting of exquisite delicacy that was previously attributed to Giorgione. These "archaic" works are deeply influenced by the poetic Arcadian spirit of Giorgione, but, at the same time, they reveal Titian's own tendency toward a more marked sense of movement and drama. Also belonging to this category are several paintings, probably executed in the years 1506–08, which are known from engravings by Valentin Lefebvre (Le Febre) in *Opera selectiora quae Titianus Vecellius Cadubriensis et Paulus Caliaris Veronensis inventarunt ac pinxerunt* (1682). These are mostly landscapes with figures, directly inspired by Giorgione and probably also by Titian's contacts with Giulio Campagnola, who was in Venice in 1507 and may well have initiated him in the art of engraving. Titian's early interest in the depiction of landscape may also have been stimulated by the picturesque scenery of the Cadore and the fanciful prints of Albrecht Dürer, who was in Venice in 1506. Titian's landscapes were famous and highly praised by his biographers, including his contemporary Paolo Pino (1548). However, once his Giorgionesque phase was over, Titian became ever less subject to the fascination of landscape, which, although present in many of his masterpieces, was to acquire a marginal character in comparison with the human figure, the basic element of his art. Thus in all the works preceding the Fondaco frescoes the cast of Titian's personality is well delineated: he shrinks from the vague and indefinite and, although moving in a highly poetic sphere derived from Giorgione's "world," molds his personages with a concreteness of intention unparalleled at that time. In the interval between the Fondaco cycle and the frescoes for the Scuola di S. Antonio in Padua, Titian must have executed other works, as is indicated by the stylistic differences found in these two series of frescoes. In the treatment of the drapery the soft contours of the Fondaco

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

frescoes are replaced by strong, straight lines in the Padua frescoes, showing a more dynamic approach.

These characteristics of style and the "novelties" that Titian introduced in his paintings provide the key to the later development of his early art, entangled as the latter was *ab origine* with the last manifestations of Giorgione's art. And it is in the clarification of this aspect of Titian's art that his early artistic personality acquires its rightful importance, having been enriched by some of the most celebrated masterpieces of Venetian painting — the last works of Giorgione. First among these is Giorgione's famous *Sleeping Venus* (VI, PL. 195), which is almost certainly identifiable with the painting seen by Michiel in 1525 in the house of Gerolamo Marcello. Michiel noted that the painting was by Giorgione, but that the landscape and cupid (since overpainted) were finished by Titian. The conception of this work, so pure and dreamlike in its beauty, is undoubtedly Giorgione's, whereas the substantial brushstrokes and the resolute drawing, so unlike the *sfumato* outlines of Giorgione, confirm the literary evidence and demonstrate Titian's considerable share in the execution of this work. Titian is, in fact, supposed to have completed a number of canvases left unfinished by Giorgione.

The Louvre *Concert Champêtre* possesses the highly lyrical character of Giorgione's art, but Titian's hand is apparent in the dominance of figures over landscape, in the heavy impasto, and in the points of contact, both iconographical and stylistic, with the frescoes in Padua. Closely connected with this evocative work are Titian's "Noli me tangere" (XII, PL. 94) and *Christ and the Adulteress* (Glasgow, Art Gall. and Mus.). A copy of this last work in Bergamo (Gall. dell'Acc. Carrara) shows the painting as it was before being cut; a fragment of the original with the head and shoulders of a young soldier is in the Arthur Sachs Collection in New York. In the *Christ and the Adulteress* the dramatic movement of the figures is already in marked contrast with Giorgione's contemplative absorption and clearly reveals a conceptual detachment from it. The same tendencies can be found in the *Madonna and Child with SS. Anthony and Roch* (PL. 89), which is stylistically akin to Giorgione's altarpiece of the *Madonna Enthroned* (VI, PL. 185), but differs in its richer chromatic feeling.

Among the works previously attributed to the mature Giorgione and now generally ascribed to Titian are the *Christ Bearing the Cross* (Venice, Scuola di S. Rocco) and the so-called "Gypsy Madonna" (Vienna, Kunsthist. Mus.), which is very similar to the above-mentioned *Madonna and Child*. Another painting in this group is the splendid and dramatic Pitti *Concert*, with its poignant relationship between the individual figures and the intensely spiritual atmosphere. These paintings are already charged with the dynamic quality that expresses Titian's bold new spirit.

Other works belonging to this period are the *Circumcision* (New Haven, Yale Univ. Art Gall., Jarves Coll.); the *Venus and Cupid* (London, Wallace Coll.), which is badly preserved; the altarpiece of the *Five Saints* (Venice, S. Maria della Salute), which, according to Fogolari (1935), was probably painted as an ex-voto after the plague of 1510; and the *Raphael and Tobias* (Venice, Accademia). To these may be added the *Madonna and Child with the Infant St. John* formerly in the Cook Collection, Richmond, Surrey, and the *Angel* in the Galleria Doria Pamphili, Rome. The *St. George* in the Cini Collection in Venice is slightly later.

The first payment for the frescoes in the Scuola di S. Antonio in Padua was made to Titian on Dec. 1, 1510; the frescoes were begun on Apr. 23, 1511, and final payment was made on Dec. 2, 1511. The scenes from the life of St. Anthony of Padua depict him granting speech to an infant (PL. 89), bringing back to life a woman killed by her jealous husband, and reattaching the foot of a young man who had cut it off after kicking his mother. On comparing these figures with those carried out only three years before for the Fondaco dei Tedeschi, one remains struck by the great steps Titian had taken in so short a time. The break with Giorgione's art is now pronounced and substantial. Titian has found in the human figure the measure and essence of his art. His personages acquire flesh and blood, and they are made to move and act with the impetus of splendid actors in an exalted human drama. The spirit pervading the Paduan frescoes arises from a realism and vitality that has its only contemporary equivalent in the works of Michelangelo.

In these frescoes there is also to be found a new treatment of color. Owing to long-standing tradition there remained in Venetian painting a particular taste for color, which differed from that of other schools both in its softer accents and in its more intense tonality. With Giorgione these qualities were realized to the maximum degree. The color, conceived not as an element to be superimposed on the design but as the means of suggesting forms, itself creates the figures, whose contours dissolve in the surrounding background. Titian accepted this basic principle and continued to elaborate and develop it by degrees. It was in Padua that he began to paint with touches of pure color, obtaining not only a fusion of the individual parts but also a greater depth of atmosphere and a more immediate sense of space.

Furthermore, with the Paduan frescoes Titian established a new ideal of female beauty, which was to persist in Venetian painting and eventually become the norm of subsequent centuries up to modern times. This ideal is found in a number of works from the years immediately following the decoration of the Scuola di S. Antonio — among them the *Tarquin and Lucretia* and *Violante* (both, Vienna, Kunsthist. Mus.), *Vanitas* (Munich, Bayerische Staatsgemäldesammlungen), *Girl Combing Her Hair* (Louvre), *Flora* (PL. 90), *Salome* (Rome, Gall. Doria Pamphili), and the later *Venus Rising from the Sea* (Edinburgh, Nat. Gall. of Scotland, Ellesmere Loan), as well as the opulent female figures in his religious paintings of this period.

Besides marking the highest achievement of his youth and the beginnings of his mature style, the Scuola di S. Antonio frescoes also include a gallery of portraits that confirm Titian's authorship of a number of the already-mentioned works traditionally attributed to Giorgione. There is no doubt that the St. Anthony of the Paduan frescoes is the same as that in the *Madonna and Child* altarpiece in Madrid; that the two young men of the Louvre *Concert Champêtre* reappear in the frescoes; and that there is a strong affinity between the man with long hair in the Glasgow *Christ and the Adulteress*, the ascetic musician in the Pitti *Concert*, and the figure of Christ in the "Noli me tangere" in London. The solemn figure of the mother in the scene representing St. Anthony granting speech to an infant may well be regarded as sister to the lady known as "La Schiavona" in the National Gallery, London.

Titian's brilliance was also affirmed in portraiture. Among the most significant examples from his youthful period are the pensive *Knight of Malta* (Uffizi), assigned to Giorgione by some critics; the *Sick Man* in the same gallery, dated 1514; the *Young Man with Blond Hair and Plumed Cap* (Sussex, Petworth House), whose lively, yet dreamy look is reminiscent of Giorgione; the *Man in a Red Cap* (PL. 90), portraying the same figure absorbed in reverie; and the similar *Young Man Holding His Cap* (London, Earl of Halifax Coll.).

Other splendid portraits dating approximately from this period are the *Portrait of a Venetian Gentleman* (Washington, D.C., Nat. Gall., Kress Coll.), previously attributed to Cariani (G. de' Busi); the supposed portrait of Raphael (formerly London, Saville Coll.); the so-called "Ariosto" (London, Nat. Gall.); and the *Portrait of a Man* (New York, Met. Mus., Bequest of Benjamin Altman).

Stylistically close to the examples enumerated above are the *Portrait of an Elderly Man in a Landscape* (Copenhagen, Statens Mus. for Kunst); the *Portrait of a Musician* (Rome, Gall. Spada); the so-called "Bravo" (Vienna, Kunsthist. Mus.), which is markedly Giorgionesque in taste; the *Portrait of a Man in Fur* (Derbyshire, England, Trustees of the Chatsworth Settlement); the *Portrait of a Man of Letters* (Hampton Court, England, Royal Colls.), previously identified with Jacopo Sannazzaro; the portrait once thought to be Aretino (Munich, Alte Pin.); and the portrait of Tommaso Mosti (Florence, Pitti). All these are strongly individualized portraits, which are at the same time idealized by an intense expression of inner life and by a sense of high moral dignity.

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

Probably a little earlier in date, from between 1512 and 1514, is the brilliant Balbi *Sacra Conversazione* (Genoa, Coll. Doria Balbi), which Morassi (1946) has added to the catalogue of Titian's important early works.

In 1513 Titian declined an invitation to go to Rome as court painter to Leo X and remained instead in Venice, where he offered to paint a battle scene in the Sala del Maggior Consiglio of the Doges' Palace for the Council of Ten. He is known to have set up his studio in the area of S. Samuele and to have taken on two assistants. However, it was only after the death of Giovanni Bellini in 1516 that Titian assumed a position of unrivaled supremacy in Venice. That year he was accorded the most desired form of official recognition: the commission to paint the Frari *Assumption*. This altarpiece for the Church of S. Maria Gloriosa dei Frari was completed in 1518. Poised in the vivid golden light of the sky, the powerful figure of the Virgin, in adoration of the vision of God the Father, is surrounded by angels, while the Apostles below, surprised by the miraculous event, dramatically express their mood with expansive gestures of wonder (cf. study of Apostles, IV, PL. 276). Heaven and earth seem to be united by the dynamic quality of the divine and human figures.

Few of the works carried out by Titian between 1510 and 1520 may be dated with certainty, except for the Frari *Assumption*. He was present at the court of Ferrara early in 1516, the year in which he painted *Christ and the Tribute Money* (Dresden, Gemäldegal.) for Alfonso d'Este. This work is said by his biographers to have been painted in emulation of Dürer. Another work from this period, signed and dated 1520, is the altarpiece representing the Madonna and Child with SS. Francis and Blaise commissioned by Alvise Gozzi of Ragusa for the Church of S. Francesco delle Scale in Ancona, where it is now housed in the Pinacoteca Comunale. Although considerably darkened owing to its imperfect state of preservation, this monumental work possesses a strength of light and a solemnity of conception that make it one of Titian's major altarpieces.

On stylistic grounds it is also possible to assign the following works to the decade 1510–20: the *Baptism of Christ* (Rome, Mus. Cap.), mentioned by Michiel as being in the house of the Spanish art dealer Zuan Ram in 1531; the *Three Ages of Man* (PL. 93); the *Holy Family and a Shepherd* (London, Nat. Gall.); the *Sacra Conversazione* (Dresden, Gemäldegal.); the *Madonna of the Cherries* (Vienna, Kunsthist. Mus.); and the *Madonna and Child with SS. Ulfus and Bridget* (Prado), one of Titian's most pleasing *sacra conversazione* paintings, in which St. Ulfus is thought to be a self-portrait. The Louvre *Madonna and Child with SS. Stephen, Maurice, and Jerome*, long held to be a copy of a lost original, dates from about 1520.

The altarpiece depicting Alexander VI presenting Jacopo Pesaro, Bishop of Pafo, to St. Peter (Antwerp, Mus. B. A.) occupies a place of its own. The somewhat archaic composition has led some critics to consider it an extremely early work, possibly even begun by Giovanni Bellini, and executed during two different periods, one before the Padua cycle and the other, limited to the bas-relief, between 1515 and 1520. However, it is more likely that it dates from about 1512–14 on the basis of stylistic affinities with the above-mentioned Balbi *Sacra Conversazione*.

Meanwhile Titian painted three fine scenes for the Duke of Ferrara: the *Worship of Venus* (PL. 94), the *Bacchanal* (PL. 93), and lastly, in 1523, the *Bacchus and Ariadne* (X, PL. 250). These paintings stand out in Titian's *œuvre* not only for their extraordinary wealth of poetic invention and the classical perfection of the lively figures (on which Rubens was to draw copiously for inspiration) but also for their brilliant and translucent coloring. In these works the drawing is precise and the separate parts are carefully elaborated and "executed with incredible diligence" (Vasari). Since the same characteristics are to be found in the previously mentioned *Christ and the Tribute Money*, it appears that Titian carried out his commissions for the Duke with maximum care and in a more measured and traditional style, reminiscent of Giovanni Bellini. It should be remembered that Bellini had also painted for the Duke of Ferrara the famous *Feast of the Gods* (XII, PL. 44), which was unfinished at his death and subsequently completed by Titian. Thus Bellini's influence on Titian's Ferrara works may have been spontaneous or an adaptation to the milieu, or else it may have entered into them in response to the expressed wishes of the Duke. These works do in fact provide a contrast to his altarpieces, in which he adopted a bolder, broader technique and a play of color and chiaroscuro designed to obtain more striking effects.

Shortly after the Frari *Assumption* Titian must have executed the painting (variously dated by scholars, but certainly of the years 1519–22) for the Malchiostro Chapel in Treviso Cathedral. This work treats the theme of the Annunciation in an entirely original manner, with the Angel appearing from the background and the Madonna turning toward him, while the lines of the floor and the architecture accentuate the sense of depth.

The scheme of the slightly turned and foreshortened head set at an angle to the body, which first appears in the Fondaco dei Tedeschi frescoes and occurs repeatedly thereafter in scenic compositions and portraits, reaches its fullest development in the *Sacred and Profane Love* (PL. 94), a masterpiece in the same lyrical vein as the Louvre *Concert Champêtre* that dates from about 1515. The two female figures, whose real meaning remains obscure, fully incarnate the ideal of beauty found in Italian art throughout the first decades of the 16th century: fullness of form, balance, and fluidity of line.

Between 1520 and 1530 Titian's work was in great demand. On Apr. 24, 1519, Titian signed a contract with Jacopo Pesaro, Bishop of Pafo, to paint another work for the Church of S. Maria Gloriosa dei Frari. The work, which was not completed until 1526, shows the enthroned Madonna and the Christ Child between SS. Peter and Anthony with adoring members of the Pesaro family (PL. 96). That sense of grandiosity which characterizes Titian's art is still further accentuated here, not only in the stateliness of the figures but also in the skillful diagonal composition, which is based on a rhythmic recession of ascending planes, culminating in the monumental architecture with the two columns that seem to soar into the sky.

Altobello Averoldo, the papal legate, ordered a polyptych from Titian for the Church of SS. Nazaro e Celso in Brescia (PL. 95), for which Titian had completed only the section representing St. Sebastian by November, 1520. At the same time he was under pressure to complete the Duke of Ferrara's *Bacchanal* and thus was unable to complete the polyptych until more than a year later, after a stay in Brescia. This complex work, which follows the traditional scheme of 15th-century polyptychs, is imbued, however, with a totally revolutionary pictorial spirit. The painting is full of dramatic chiaroscuro effects and displays a plasticity that is grandiose and almost baroque, especially in the contorted figure of St. Sebastian and in the triumphant Christ rising heavenward.

By this time Titian's fame had also reached the court of Mantua, where he is documented as having painted a portrait for Federico Gonzaga in 1523. In the same year Titian was asked to deliver the paintings commissioned earlier for the Sala del Maggior Consiglio of the Doges' Palace. The newly elected doge Andrea Gritti also commissioned Titian to fresco the figure of St. Christopher on the stairway of his private apartments, a work resembling the St. Sebastian of the Brescia polyptych in its Michelangelesque physique.

In 1524 Titian paid a second visit to the Este court at Ferrara, and on his return to Venice in 1525 he married Cecilia, who had come with him from his native Cadore. Before her death in 1530 she was to bear him three children: Pomponio, Orazio, and Lavinia.

Titian's *Martyrdom of St. Peter* won the competition sponsored by the Venetian Confraternity of St. Peter Martyr in 1528, and the work was unveiled in the Church of SS. Giovanni e Paolo on Apr. 27, 1530. The altarpiece was destroyed by fire in 1867, but the composition is known from engravings and numerous copies. This is an important work because it reveals Titian's renewed interest in landscapes.

In 1527 Pietro Aretino fled the Sack of Rome and settled in Venice. Titian immediately became one of his friends, and

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

Aretino spread Titian's fame "as far as [his] pen reached" (Vasari). Another figure who made Venice his permanent home after the Sack of Rome was Jacopo Sansovino, who likewise became a close friend of Titian and with whom he is recorded as having worked for the court of Mantua in 1531.

In 1529 Clement VII and Charles V met in Bologna, where, owing to introductions from Aretino and the Marquis of Mantua, Titian had his first contacts with the Emperor and painted his portrait. When Charles V returned to Bologna in the years 1532–33 to have Titian paint another portrait, he appointed the artist his official portrait painter and granted him titles of nobility.

As Titian's fame increased, more and more public figures vied with one another to have their portraits painted by him. Portraits that undoubtedly date from between 1520 and 1530 are the following: *Federico Gonzaga* (Prado); *Nobleman of the Farnese Family* (Pommersfelden, Germany, Countess Ruffo-Schönborn Coll.); *Baldassare Castiglione* (Dublin, Nat. Gall. of Ireland); *Gentleman with Hawk and Hound*, or *Federico Gonzaga* (Omaha, Nebr., Joslyn Art Mus.); *Portrait of a Man* (signed; Berlin, Mus. in Dahlem); and *Mathias Hofer* (Duino, Italy, Coll. Prince Torre e Tasso). From all these figures there breathes a sense of dignity, an aura so austere that it transports them to a higher, ideal sphere. In about 1523 Titian also painted the portrait of Alfonso d'Este with his arm resting on a large artillery piece. This painting has been identified by some critics with the portrait of Alfonso of Ferrara in the Metropolitan Museum, New York.

The fact that Titian painted Charles V on several occasions — for instance, the full-length portrait of the austerely clad Emperor with his dog in the Prado — could not fail to increase his reputation as a painter. In the 1530s commissions continued to multiply. Titian portrayed Cardinal Ippolito de' Medici in Hungarian costume (Florence, Pitti), a work which Vasari says was executed in Bologna in the years 1532–33. Then he painted an idealized reminiscence of Isabella d'Este (1534–36) as a youthful beauty (Vienna, Kunsthist. Mus.) and a now lost portrait of the Cardinal of Lorraine (ca. 1534).

In 1536 Titian was working on a portrait of Francesco Maria della Rovere, Duke of Urbino, which he completed in 1538, and in the same period he also painted Eleonora Gonzaga, Duchess of Urbino (both, Uffizi). Meanwhile, in 1537, Ercole II, Duke of Ferrara, received a portrait of Alfonso d'Este (d. 1534), of which the Pitti canvas is perhaps a copy. To this distinguished list should be added the following lost works: a profile portrait of Francis I of France (1539), executed from a medal by Benvenuto Cellini and generally identified with the canvas of the same subject in the Louvre (1538; copies in the Coppet Coll., Lausanne, and the Harewood Coll., London), and yet another rendition of Charles V and a portrait of Suleiman the Magnificent, to both of which Titian was putting the finishing touches in 1539, according to a letter of Gian Giacomo Leonardi, Urbino's ambassador to Venice.

Vasari also records a portrait of Francesco Sforza, Duke of Milan (ca. 1534). From other sources it is known that Titian executed no longer traceable portraits of Guidobaldo di Camerino (1538), Count Agostino Lando (1539), Giulia and Paolo Da Ponte (1540), and Don Diego Mendoza, ambassador of Charles V to Venice. According to Vasari, the last-mentioned work, painted in 1541, was a full-length portrait, important for being one of the earliest examples of this type, which was introduced by Titian and later widely imitated.

Other portraits of this period are those of Alessandro degli Organi (now lost), Pietro Bembo (possibly the painting in the National Gallery, Washington, D.C.), and Commandante Vincenzo Capello (the example in the National Gallery, Washington, D.C., although sometimes attributed to Titian, is more probably a work of the school of Tintoretto) — all of which were painted in 1540. To these should be added the portraits of General Alfonso d'Avalos del Vasto (Paris, Coll. Marquis de Ganay); Gabriele Tadino, commander of Charles V's artillery (New York, L. Bendit Coll.); the Friulian Count Antonio Porcia (Milan, Brera); and, lastly, the signed portrait thought to be Laura de' Dianti (formerly, Richmond, Surrey, Cook Coll.; copy in Modena). In these works the aura of mystery and intimacy of his earlier Giorgionesque portraits has given way to a new heroic and ideal conception in which the individuality and the moral and social character of the sitter are acutely expressed.

Titian's sacred and secular compositions were no less in demand than his portraits. It is known that in February, 1530, he was working for Federico Gonzaga on a depiction of the Madonna and Child with the Infant St. John and St. Catherine, a work that is generally thought to be the so-called "Madonna of the Rabbit" in the Louvre. This work shows a renewed interest in landscape and a greater harmony in its relationship to the figure. The same subject is repeated in the *Madonna with the Infant St. John and St. Catherine* (1533) in the National Gallery, London, which is also stylistically close to the Louvre canvas in the emphasis given to the evocative landscape. The Uffizi *Madonna and Child with the Infant St. John and St. Anthony Abbot* probably dates from a few years earlier.

Also dating from this particularly poetic period in the art of Titian is the moving *Entombment* (PL. 91), datable about 1525, in which the intensity of the drama is expressed both by the sorrowful figures and by the landscape under an evening sky. The composition was probably inspired by Raphael's *Deposition* (IV, PL. 314), but Titian's work surpasses it in the effectiveness of the coloring and the touching human depth. Another work of perhaps about this date is the *Twilight Landscape with Shepherd and Flocks* (Hampton Court, England, Royal Coll.), which, though not unanimously agreed upon, is almost certainly by the master.

Stylistically similar to the *Entombment* and perhaps a few years later in date is the *Supper at Emmaus* (Lincolnshire, Brocklesby Park, Earl of Yarborough Coll.), in which the artist has succeeded in establishing a profound and intimate relation between the separate figures in a composition that appears almost archaic owing to its single perspective plane. A second version of this work painted for the Maffei family of Verona is now in the Louvre. A still later replica, probably executed with the participation of assistants, is in the National Gallery of Ireland in Dublin.

On Sept. 1, 1531, Titian left his S. Samuele studio and moved into his house in the S. Canciano ai Birri district. His relations with the Doge remained close. A votive painting representing Doge Andrea Gritti in adoration of the Madonna and Child with SS. Mark, Bernardino, Alvise, and Marina was noted in the Doges' Palace in 1531 (Sanuto, 1496–1533, diary entry for Oct. 6, 1531). Destroyed by fire in 1577, the work is known from an anonymous engraving to have followed the same grandiose scheme as the Pesaro altarpiece. A number of other works painted in 1531 are also lost.

Titian's relations with Francesco Maria della Rovere, Duke of Urbino, began in 1532 through Gian Giacomo Leonardi, Urbino's ambassador to Venice. In the same year he was working on no less than three canvases for the Duke: a Christ, a Nativity, and a portrait of Hannibal. The painting of the Nativity, probably identifiable with the *Adoration of the Shepherds* in the Pitti, Florence, reached Pesaro in November, 1533, while the other two works were delivered in March, 1534. The depiction of Christ is almost certainly the same painting as Titian's *Head of Christ* in the Pitti, which is typologically close to that of the *Christ and the Tribute Money* in the Gemäldegalerie, Dresden, but rendered more poetic by the presence of a landscape background. Titian again took up the same theme in the *Temptation of Christ* in the Institute of Arts in Minneapolis. In this work, datable to the early 1540s, certain mannerist tones are apparent.

In 1536 Federico Gonzaga commissioned Titian to paint bust portraits of the Twelve Caesars for the Sala di Troia of the Palazzo Ducale in Mantua, which Giulio Romano had just finished decorating. Four of the portraits were completed by the following year. The last in the series must have been painted by Giulio Romano. Though the portraits were lost when they were transferred to Spain, they are recorded in the Sadeler engravings and in numerous copies.

Titian painted the theme of the Annunciation in 1537 for

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

the Convent of S. Maria degli Angeli in Murano. This lost work is known from an engraving by Gian Giacomo Caraglio. Some years later he returned to the same subject in the painting given by Amelio Cortona to the Scuola di S. Rocco, Venice, in 1555. In this work the figures are placed before a balustrade, beyond which a landscape is visible — a compositional scheme that would later inspire Paolo Veronese.

In 1513 Titian had offered to paint a battle scene for the Sala del Maggior Consiglio of the Doges' Palace, but it was only on June 23, 1537, that he actually began work on it. The work was delivered in August of the following year. This vast canvas (or *telero*) is believed by some to have represented the rout at Chiaradadda (Vasari), by others the battle of Spoleto (Sansovino, 1581), and by still others the battle of Cadore (Ridolfi, 1648) — the last being the title by which it is generally designated. Destroyed by fire in 1577, the work is known through a copy in the Uffizi and a 1569 engraving by Giulio Fontana. This depiction of a battle scene, vigorously and dramatically portrayed, was to remain the supreme example of the genre until the advent of Rubens and Velázquez.

Stylistically related to Titian's work of the 1530s are the Louvre *Allegory*, datable to the early years of the decade, the subject of which has been variously interpreted, and the *Assumption* in Verona (III, PL. 310). In the latter the color tones are more subdued, resulting in a softness of transitions and gradations, and there are echoes of Roman mannerism in the agitated poses of the Apostles that contrast strongly with the inspired ardor of the Frari *Assumption*.

Another work of the mid-1530s, the *Madonna and Child in Glory with Six Saints* (Rome, Pin. Vat.), is somewhat archaic in its harsh, almost synthetic simplicity and in the presence of the wall in the background. Between 1534 and 1538 Titian painted the *Presentation of the Virgin in the Temple* (PL. 99), his largest work up to that time, for the Scuola della Carità in Venice.

It is now universally accepted that the *Venus of Urbino* (XII, PL. 66) is to be identified with the canvas of a nude woman received by Guidobaldo II, Duke of Urbino, in March, 1538. Instead of being depicted in a vast, open landscape, which is the dominant element in Giorgione's *Sleeping Venus* (VI, PL. 195), Titian's Venus is reclining within a sunlit room, where two women are taking clothes from a chest. The model for the *Venus of Urbino* had been immortalized two years earlier in the masterpiece *La Bella* (Florence, Pitti), identifiable with the picture of the woman in a blue dress that the Duke of Urbino asked Titian to finish on May 2, 1536. She appears again in the *Girl in Fur* (Vienna, Kunsthist. Mus.), more intimately portrayed with her right hand arresting her fur mantle on the naked beauty of her breast. This theme, with the addition of a plumed hat, is repeated in the version in The Hermitage in Leningrad.

The Duke of Urbino also owned the *Magdalen* (Florence, Pitti) — which, according to Vasari, hung in the palace cloakroom — whose languid pose anticipates the baroque. This subject was often repeated by Titian with slight variations and toward the end of his life with a more fluent technique.

Another famous masterpiece is the variously dated *Jupiter and Antiope*, known as "Vénus du Pardo" (PL. 99), the composition of which unmistakably recalls the *Bacchanal* painted for the Duke of Ferrara, though the pictorial rendering is freer and more elaborate. This enormous canvas is almost a recapitulation of the path Titian had traveled from his youthful period of lyrical Giorgionesque themes to the moment of his rediscovery of landscape as the balancing element between the human figure and nature. The dates proposed for the painting generally fall within the last half of the 1530s; judging from the breadth and fluency of the pictorial style, however, it is likely that the painting was later reworked, possibly as late as 1560.

Titian's artistic production between 1530 and 1540 concludes with a historical painting, *The Allocution of Alfonso d'Avalos, Marqués del Vasto* (PL. 100). A letter from Aretino to the Marqués tells us that Titian began the work toward the end of 1540 and that he sent the "modello," now lost, to D'Avalos in December of the same year. In August, 1541, the canvas was finished and dispatched to Milan, where the Marqués was staying at the time. In this work Titian once more displays his mastery in elevating a worldly event to an idealistic plane through the dignity he confers on the scene. The pictorial rendering, true to life but never lost in superfluous detail, lends itself perfectly to the creation of this timeless quality.

Mention has already been made of mannerist tendencies in Titian's works of the 1530s and earlier. The source of these suggestions was the particular cultural and artistic climate of Venice in those years. The cultural environment was dominated by Pietro Aretino, who had been in contact with the "classical" idols in Rome, as well as by the classical influence that the works of Michelangelo were spreading everywhere. Also in Venice the Roman style had made its converts, foremost among them Pordenone. The spread of the mannerist movement was rekindled by the presence of several Roman-Florentine painters, among them Francesco Salviati, who was summoned to Venice by the Grimani family in 1539; another was his pupil Giuseppe Porta, called Salviati, known from documents to have been in Venice in 1541, where he popularized the mannerist style in frescoes painted on the façades of several Venetian palaces. In addition, interest was aroused by the activity of Giulio Romano and Francesco Primaticcio in Mantua and by the elegant style of Parmigianino, whose work was well known from engravings. Titian was unable to ignore these formal innovations, but through the high level and originality of his style he gave them an entirely personal interpretation, constituting not so much an ideological acceptance as a transitory recognition of taste, which in no way damaged the spirit of his work.

In fact, the extreme formal attitudes in the *Crowning with Thorns* (Louvre) might be defined as manneristic, even though the term, in this case, does not apply to the over-all conception. The painting probably dates from shortly before Titian's journey to Rome. His new treatment of the subject did not fail to make a profound impression on his contemporaries; this was the first time they had seen the theme of Christ being mocked by the Jews depicted with such dramatic violence and with such a forceful sense of modeling in the figures. The pained and contorted face of Christ and the ferocity of the mockers bring to mind the terrifying "naturalistic" representations of northern artists.

On the contrary, none of this formal or dramatic ostentation is encountered in the *John the Baptist*, painted for the Church of S. Maria Maggiore in Venice and now in the Accademia. The powerful figure of the saint is truly daring, though the slightly mannered pose (perhaps inspired by Sansovino's sculpture) obscures its spontaneity. Mannerist accents are also found in the *Tobias with the Angel Raphael* in the Church of S. Marziale in Venice.

Vasari relates that during his stay in Venice (1541–42) he was asked by Sansovino, who was directing the building of the Church of Sto Spirito in Isola, to design three large oils for the ceiling. After Vasari's departure, however, the commission was given to Titian. These works — *The Sacrifice of Abraham*, *David and Goliath*, and *Cain Slaying Abel* — now hang in the sacristy of S. Maria della Salute. Begun after August, 1542, they were presumably finished in 1544, on the evidence of a letter from Titian in December, 1544, to Cardinal Farnese. These scenes are conceived with deliberate violence, and Titian's *giganti* vie with those of Giulio Romano. The use of light bursting and darting through the compositions increases the expressiveness of the forms.

Contemporary with these works are the *St. John the Evangelist on Patmos* (Washington, D.C., Nat. Gall.), which repeats the foreshortened motifs of the canvases in S. Maria della Salute, and other studio works that originally formed part of the decoration of a ceiling in the Scuola di S. Giovanni Evangelista in Venice.

Titian's letter to Cardinal Farnese also tells of a dispute between the painter and the monks of Sto Spirito in Isola, who owed him money for several works, including the three above-mentioned ceiling canvases now in the sacristy of S. Maria della Salute. The controversy apparently arose over a panel depicting the descent of the Holy Spirit, painted in 1541 for

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

the church of the canons of Sto Spirito in Isola, which had deteriorated to such an extent that the artist was obliged to repaint it. The second version, preserved in S. Maria della Salute, is generally dated on stylistic grounds between 1555 and 1560; it marks an important step in Titian's artistic development because of its highly dramatic quality and the gleaming light effects, significant for future artists and for El Greco in particular.

Payments made by the Confraternity of Corpus Domini of Urbino indicate that between 1542 and 1544 Titian painted a *Resurrection* and a *Last Supper* (Urbino, Gall. Naz. delle Marche), which originally formed the two sides of a banner, but which were already divided by 1546. In both these works there is perhaps less creative impulse, which has led some critics to regard them as studio products; but they are certainly Titian's own work by virtue of their inventiveness and their stylistic affinities with the *Ecce Homo* in Vienna (Kunsthist. Mus.). The latter work, signed and dated 1543, was Titian's highest achievement of the early 1540s. According to Vasari, this large canvas was painted for Giovanni d'Anna, a Flemish merchant, in whose house the painting was hanging in 1574. It was highly praised by Henry III of France, who offered to buy it for 800 ducats. Ridolfi (1648) noted that it was Titian's intention to portray Aretino in the figure of Pontius Pilate, Suleiman and Charles V in the two knights, and himself in another figure. In the girl dressed in white Tietze (*Leben und Werk*, II, p. 315) saw Titian's daughter, Lavinia. The tumult of the crowd with arms upstretched before the background of a threatening sky, against which are silhouetted standards and halberds, subsides in the figure on the flight of steps leading to the platform, where Pontius Pilate points at the suffering Christ. It is a highly dramatic composition in which each figure assumes the force of a personage, becoming a pictorial entity in itself.

During this period Titian was very active in the field of portrait painting. Two of his masterpieces are the child portraits of Ranuccio Farnese (1542; Washington, D.C., Nat. Gall.) and Clarice Strozzi (Berlin, Mus. in Dahlem). The latter (signed and dated 1542), with its vibrant spontaneity in the figure of the young girl seen before an airy stretch of countryside, came to exert significant influence on the history of portraiture.

From a letter written on July 10, 1542, by a correspondent to Cristoforo Madruzzo, later appointed bishop of Trento, it is known that by then Titian had completed a portrait of the prelate, which is now generally regarded as the one in the Museu de Arte in São Paulo, Brazil. However, the date 1552, inscribed with the signature on the canvas, suggests that this is a second version of the portrait, or else the first version, finished ten years later and in part repainted.

In April, 1543, Pope Paul III arrived in Emilia for a meeting with Charles V. Titian, who was present at his entry into Ferrara, followed the court to Busseto and Bologna. In July of that year he finished a portrait of the Pope (Naples, Mus. di Capodimonte) that reveals an exceptional expressive power.

Other works documented by Aretino's letters are the portrait of Daniele Barbaro (Ottawa, Nat. Gall. of Canada), executed for Paolo Giovio and mentioned in February, 1545, and the portrait of Pietro Aretino, usually identified with the Pitti painting (PL. 97), which was sent to Cosimo I de' Medici in October, 1545, as well as a number of other portraits now lost. Also significant examples of Titian's work in this field from the same period are the portraits of Giacomo Doria (Bedfordshire, Luton Hoo, Wernher Coll.), Monseigneur D'Aramont (Milan, Castello Sforzesco), Doge Andrea Gritti (Kenosha, Wis., Heirs of N. Allen), the same sitter in a later work (Washington, D.C., Nat. Gall.), Doge Niccolò Marcello (Rome, Pin. Vat.), and Sperone Speroni (slightly marred; Treviso, Italy, Mus. Civ.), as well as the portrait of a gentleman wearing the Order of Santiago (Munich, Alte Pin.). Another work that probably belongs to this period is the refined portrait known as the *Young Englishman* (Florence, Pitti), in which the subtlety and psychological penetration demonstrate Titian's capacity for capturing all the nuances of human feeling.

It was as a result of his contacts with the Farnese family that Titian was invited to Rome. He undertook the journey in the autumn of 1545, passing through the Marches, where he stopped at the court of Guidobaldo II, Duke of Urbino, in order to paint the Duchess, Giulia da Varano. Titian reached Rome in October and was welcomed with many honors by Pietro Bembo, Cardinal Farnese, and Pope Paul III. He stayed in the Belvedere Palace in the Vatican and was visited by the elderly Michelangelo. Vasari guided him on his tours of Rome, and Sebastiano del Piombo accompanied him to admire the Vatican Stanze.

Titian painted another, full-length portrait of the Pope seated in a large chair and attended by his grandchildren Ottavio and Alessandro Farnese (Naples, Mus. di Capodimonte), thereby introducing a new type of portrait containing several figures. This work, only barely sketched in parts, and executed with free and impetuous brushstrokes, already contains the potential measure of Titian's late style. The Museo di Capodimonte also possesses other portraits painted for the Farnese family in this period: those of Cardinal Alessandro Farnese and Pier Luigi Farnese, who is shown in a suit of armor with his hand on his sword, and a portrait of the aged Pietro Bembo before a landscape background. Other works that undoubtedly belong to the Farnese group are the portrait of a young girl (Naples, Mus. di Capodimonte), thought by some critics to be Titian's daughter, Lavinia, and that of Pope Paul III wearing the *camauro* (PL. 92). The supposed portrait of Vittoria Farnese (Budapest, Mus. of Fine Arts) should be excluded from the catalogue of the artist's works.

But the best-known work of the Farnese group is the *Danaë* (Naples, Mus. di Capodimonte), one of Titian's most successful and balanced mythological interpretations. Vasari relates that he saw the painting with Michelangelo, who praised it highly, adding that "it was a pity that good design was not taught at Venice." The fruit of a completely original invention, the *Danaë* is remarkable for the realization of the figure in a new plastic rhythm. It is the prototype for the later versions in Vienna (Kunsthist. Mus.), Leningrad (The Hermitage), and Madrid (Prado).

At the request of Guidobaldo II of Urbino, Titian painted two portraits of popes of the Della Rovere family while he was in Rome: one of Julius II (Florence, Pitti), copied from the famous original by Raphael (now lost), at that time in S. Maria del Popolo, and another of Sixtus IV (Uffizi), based on the medallion in the Vatican fresco by Melozzo da Forlì.

In March, 1546, Roman citizenship was conferred on Titian. However, his stay was drawing to a close, and he returned to Venice on June 19, passing through Florence, where he visited Duke Cosimo at Poggio a Caiano.

It is known from Aretino's letters that at this time Titian painted a portrait of Doge Francesco Donato, which was destroyed in the fire of 1577 (copy in San Diego, Calif., Fine Arts Gall.). In addition to his intense activity as a portraitist, Titian finished the altarpiece *Madonna and Child in Glory with SS. Peter and Paul* (begun in 1542) for the Cathedral of Serravalle (now Vittorio Veneto), a work that betrays a somewhat archaic composition and unequal execution; and he also painted the altarpiece *St. James of Compostela* for the Church of S. Lio and *St. John the Almsgiver* for the church dedicated to that saint (S. Giovanni Elemosinario), both in Venice.

But Titian's most notable achievements of this period were primarily in the field of portraiture, of which the finest example is probably the votive portrait of the Vendramin family (ca. 1547; PL. 100). Along with the portrait of Paul III with his grandchildren, this work, which is even more lifelike and complex, gives a new and broader dimension to his art.

Invited by Charles V to Augsburg, Titian left Venice in January, 1548, accompanied by his son Orazio, his grandchild Cesare, and his pupil Lambert Sustris. He took with him an *Ecce Homo*, probably the canvas now in the Prado (of which he left a copy for Aretino), to offer to the Emperor as a token of respect.

At Augsburg Titian set to work on portraits of the most illustrious personages assembled there for the Diet. In April he began the painting of Charles V on horseback (Prado),

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

one of his most significant masterpieces in the field of portraiture. The Emperor is represented in a suit of armor, his lance at rest, as he departs for the Battle of Mühlberg. The horse, beginning to trot, is silhouetted in a landscape of trees against a reddish sky. Charles V is depicted in all his severe dignity as monarch, the embodiment of the maximum temporal power of his time. This work was to be the model for many later equestrian portraits, from Rubens to Van Dyck, from Velázquez to Rembrandt. In the same year Titian also painted a full-length portrait of the Emperor seated (Munich, Alte Pin.). From Titian's letter of Sept. 1, 1548, to Cardinal Granvelle it appears that he had painted other works for the Emperor: "a Christ [probably the above-mentioned *Ecce Homo* in the Prado], a Venus, the Empress alone, and later . . . His Majesty and the Empress." The portrait of the Empress is definitely the portrait of Isabella of Portugal in the Prado, while the Venus and the dual portrait of Charles V and the Empress must have been lost. There is a copy of the latter, attributed to Rubens, in the F. Sabin Collection in London. While he was in Augsburg Titian painted Johann Friedrich, Grand Elector of Saxony (Vienna, Kunsthist. Mus.); another portrait of the Elector in armor (Prado) is probably a copy of the lost original by Titian. Also during 1548 Titian painted Nicholas Perrenot de Granvelle (Besançon, Mus. des B. A.) and his son Antoine Perrenot (Kansas City, Mo., Nelson Gall. of Art and Atkins Mus.), works of marked formal purity that seem to reflect a certain northern influence, perhaps of Lucas Cranach the Elder or Holbein.

Titian executed portraits of other personages who were in Augsburg for the Diet: Mary of Hungary, sister of Charles V (copy in Paris, Mus. des Arts Décoratifs); Christina of Denmark; Maria Jacqueline of Baden; Maurice, Duke of Saxony; Dorothea von der Pfalz; Archduke Maximilian of Austria; Emmanuel Philibet of Savoy; Ferdinand I, King of Hungary and Bohemia (copies in the Prado and in Augsburg, Fugger-Babenhausen Coll.); Archduke Ferdinand, son of Ferdinand I; and the Duke of Alba. The quantity of works executed in such a short time, and while the painter was occupied on yet other compositions, is proof of Titian's extreme rapidity in synthesizing the characters of his subjects. His method was to sketch each sitter's basic physiognomy from life and complete the work at his leisure. Many of the works enumerated above were lost in transit to Spain or destroyed by fire in 1608.

Titian returned to Venice at the end of October, 1548. This date marks the beginning of one of the artist's most successful periods. For Mary of Hungary he started on a series of the "doomed," of which only two are extant: the *Sisyphus* and the *Tityus* now in the Prado. The *Tantalus* is known from an engraving, but there is no trace of the *Prometheus*. The conception of these figures is somewhat Michelangelesque and recalls his earlier canvases for Sto Spirito in Isola, which are now in S. Maria della Salute. About two months after his return to Venice, Titian was summoned to Milan by Crown Prince Philip of Spain, who sat for a portrait that has been identified by some critics with the painting of Philip II in the Cincinnati Art Museum; but the face in this work would seem to represent the prince some years later.

In 1548 he completed the triptych commissioned in 1543 for the parish church of Castello di Roganzuolo, representing the Madonna and Child with SS. Peter and Paul. However, this elegant composition reveals weaknesses in the execution that may be attributed to the collaboration of assistants. The work shows stylistic affinities with the polyptych with the Assumption and saints in the parish church of Lentiai; only the figure of Titian's patron saint is generally ascribed to the artist himself. Other predominantly workshop pieces are the polyptych in Dubrovnik Cathedral and the painting depicting Mary Magdalene, St. Blaise, Tobias, the archangel Raphael, and a donor in the Church of St. Dominic in the same town. It is clear that during these years Titian himself painted the more important secular and religious compositions and portraits of famous people and entrusted lesser commissions to assistants working under his direction.

Titian painted a number of works for members of the Granvelle family, most of which are no longer extant. In 1600 a Granvelle sold paintings of "a Venus in bed, with an organist" (Prado) and "a Venus sleeping with a disguised satyr" to Rudolph II. He had long since abandoned the Phidian ideal of beauty; in the works of this period he resumed the physical type of the Naples *Danaë*, emphasizing the sensual quality. Titian repeated this theme of the reclining Venus with slight variations. In the Prado there is a painting of Venus with a small dog. In Berlin (Mus. in Dahlem) a Moorish-type organist is depicted. In the version in the Metropolitan Museum, New York, he substituted a lute player for the organist and made the background more detailed, as he also did in the somewhat inferior rendering of this theme in the Fitzwilliam Museum in Cambridge, England; both of these works were painted about 1560. The Uffizi *Venus with an Owl* is a studio product.

Titian returned to Augsburg in November, 1550, again at the invitation of Charles V, and presented him with the *Mater Dolorosa* (Prado), which the Emperor took with him when he voluntarily exiled himself to Yuste in Estremadura. Also in Augsburg, Titian executed a full-length portrait of Philip II, then a prince, wearing a suit of armor, with his helmet placed on a long, cloth-covered table beside him (Prado). This was Titian's last journey, and he was never to leave Venice again after his return there in August, 1551.

As has already been pointed out, this period of Titian's activity was particularly prolific in portrait painting, which as a result of his visits to Augsburg came to be pervaded with a severity of style that conferred on his subjects an intense inner life. Both the supposed portrait of Benedetto Varchi (Vienna, Kunsthist. Mus.) and that of Antonio Anselmi (Lugano, Switzerland, Thyssen-Bornemisza Coll.) are imbued with an almost austere spirituality.

On renewed contact with the Venetian environment, however, the artist's style reverted to its former freedom. During this period he produced such masterpieces as the *Knight of Malta* (Prado), previously attributed to Tintoretto, and the portrait of the Duke of Atri (PL. 100). The latter work, chromatically dazzling and evocative for its strange interweaving of reality and fantasy, became a prototype for Velázquez. Other portraits of this period are the *Franciscan Friar with a Book* (Melbourne, Australia, Nat. Gall. of Victoria); the "Singolare Amico," a portrait of a friend of the artist (San Francisco, M. H. de Young Memorial Mus.), so called from the inscription on a sheet of paper in the sitter's left hand; and the portrait of Ludovico Beccadelli (Uffizi), signed and dated 1552. The portrait of Doge Francesco Venier (Lugano, Switzerland, Thyssen-Bornemisza Coll.), painted between 1554 and 1556, is a work of superb quality, with a view of the lagoon illuminated by the glare of a fire in the background.

On June 18, 1553, Prince Philip wrote Titian that he had received his portrait, probably the one in Naples (Mus. di Capodimonte), in which he is portrayed full-length in sumptuous dress, a dignified figure standing out against a monochrome background that dissolves into gradations of clear grayish and greenish tints. However, more human warmth and a freer use of color are to be found in Titian's less official portraits, such as that of Fabrizio Salvaresio (Vienna, Kunsthist. Mus.), which is signed and dated 1558. Also dating from the 1550s are the portraits of the sculptor Martino Pasqualigo (signed; Washington, D.C., Corcoran Gall. of Art) and Archbishop Filippo Archinto of Milan (New York, Met. Mus.), as well as the knee-length portrait of a bearded man with a scroll in his left hand (Copenhagen, Statens Mus. for Kunst).

Titian's ideal of female beauty triumphs once more in the *Portrait of a Lady* (Washington, D.C., Nat. Gall., Kress Coll.), of the early 1550s, and in the *Lady in White* (or *Portrait of a Young Bride*; Dresden, Gemäldegal.). The latter, which depicts a girl with a fan (held by some to be Titian's daughter, Lavinia, on the occasion of her marriage in 1555), was copied by Rubens (Vienna, Kunsthist. Mus.). Also said to be Lavinia is the sitter for the splendid portrait *Girl with a Fruit Dish* (Berlin, Mus. in Dahlem), who is portrayed with a fruit-laden container in her hands and with her head turned naturally toward the viewer; this fresh and original compositional invention is repeated in

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

the rather weak *Lavinia as Salome* in the Prado, in which the head of the Baptist is held in upraised hands.

Feminine beauty is splendidly represented in the *Venus with a Mirror* (Washington, D.C., Nat. Gall., Mellon Coll.), which fully reflects Titian's ideal. This work, saturated with sensual and chromatic nuances, is the only one of many versions of the same subject that can be ascribed to Titian's own hand.

It is known that in 1552 Titian sent Prince Philip a landscape and a portrayal of St. Margaret. The former, which proves that Titian was still painting in that genre, has been lost. The latter has been identified with the poorly preserved painting in the Escorial, a composition — possibly inspired by Raphael's treatment of the same subject — that is repeated some ten years later in the signed *St. Margaret* in the Prado, which is full of poetic echoes both in the figure of the saint and in the impressive landscape background caught in the light of a fire. A third version of the same subject, also signed, is in a German private collection.

In 1553, writing to Philip, Titian announced that he was completing several "poesies," or mythological compositions, and had given Francesco Vargas (Charles V's ambassador to Venice) the prince's portrait. The following year he informed Charles V that he had sent him the *Triumph of the Trinity* and the *Mater Dolorosa* (both, Prado). During Titian's second visit to Augsburg, Charles V had commissioned him to paint the *Triumph of the Trinity* (IV, PL. 232), which he took with him when he retired to a life of solitude. On the right, below the Trinity, are the Emperor, Empress Isabella, Philip II, Mary of Hungary, and the Infanta Juana. This is an ambitious work, full of tragic presentiments, which aims at grandiose effects and imitates in parts the vigorous and contorted modeling of Michelangelo. The *Mater Dolorosa* is, in the gesture of the opened hands, slightly different iconographically from the earlier painting of this subject that Titian presented to the Emperor.

One of the "poesies," *Venus and Adonis* (Prado), was sent in the autumn of 1554 to London, where Philip had married Mary Tudor. Venus, seen from behind, is attempting to hold back Adonis as he is about to leave for the chase, while a troubled and dramatic atmosphere pervades the landscape and the ragged sky. The composition recalls the *Jupiter and Antiope* (PL. 99) in its intense, lyrical tone and intimate, poetic communion between the figures and nature. There is a good replica of the *Venus and Adonis* in the National Gallery, London; two other versions, probably later, are in the Metropolitan Museum, New York, and the National Gallery, Washington, D.C. The example in the Galleria Nazionale, Rome, is mostly by Titian's own hand.

Another "poesy," also delivered to Prince Philip in 1554, is the *Danaë* in the Prado. In the same year Titian painted a "Noli me tangere" for Mary of Hungary; the fragment with Christ, which Philip had cut out of the painting, survives in the Prado. The composition is known from a copy attributed to Isabel Sánchez Coello (1564–1612) in the Escorial.

Despite his ever-increasing commitments to the imperial family, Titian succeeded in maintaining his contacts with the Venetian Republic. In 1555 and 1556 he executed a votive painting for Marcantonio Trevisan, representing the Doge kneeling before the Madonna and Child, with SS. Mark, Anthony, Dominic, and Francis. Placed above the door of the Sala dei Pregadi (or del Senato) of the Doges' Palace, this work was destroyed in the fire of 1577.

In the *St. Jerome* (Milan, Brera), probably datable to the early 1550s, which was painted for the Church of S. Maria Nuova in Venice, Titian returned to a subject he had depicted many years earlier in the Louvre canvas. Here the artist focused on a fresh, dramatic realization of pictorial concepts through new chromatic ranges and the juxtaposition of strokes and spots of contrasting color.

Between 1557 and 1559 Titian's *Martyrdom of St. Lawrence*, commissioned by Lorenzo Massolo in 1548, was placed in the Jesuit Church of S. Maria Assunta. Highly praised by Vasari, this work anticipates the late, luministic achievements of Tintoretto (q.v.) in the violent contrasts of darting light, in the emphasis of perspective, and in the tormented and excited rhythms of the forms.

In 1558 he delivered the *Crucifixion* for the Church of S. Domenico in Ancona. The solemn figures are seen against an immense night sky pierced by a reddish glow, and the drama is conveyed without a shade of rhetoric. Another work that can be assigned to about the same date is the *Annunciation* painted for the Church of S. Domenico Maggiore in Naples. This work marks the beginning of a new way of conceiving painting, no longer as solely an artistic expression of what is visible in nature but, in the search for the symbol and for the intimate essence that objects represent, as the expression of the ultimate and profound truth.

From 1559 to 1562 Titian worked on numerous projects for Philip II. Among the "poesies" promised to the king since 1553 was the *Perseus and Andromeda* (London, Wallace Coll.), which betrays the influence of Tintoretto in the emphatically foreshortened figure of the hero, who seems to be rolling down the cliff. In June, 1559, Titian wrote that he had completed two "poesies" — the *Diana and Actaeon* and the *Diana and Callisto* (Edinburgh, Nat. Gall. of Scotland, Ellesmere Loan) — and was about to start on two more, depicting the rape of Europa and Actaeon being torn to pieces by his dogs, as well a painting of the Agony in the Garden.

In the *Diana and Actaeon* and *Diana and Callisto* the pictorial achievements already manifested in the Naples *Annunciation* are further developed. The light permeates the forms, filtering through them, melting them and blurring the outlines, and imparting a sensation of vibrancy to the whole composition. The succinct lucidity of the early *Bacchanal* is far removed from this new world of the artist, who at this point stands on the threshold of modern trends, which he foresees and experiences. Copies of these two paintings, attributed to Juan Bautista Martínez del Mazo, are in the Prado. Another, slightly different version of the *Diana and Callisto* (Vienna, Kunsthist. Mus.) is undoubtedly by Titian himself.

Titian's last period is best explained by his biographers. Dolce (1557) foresees the painter's ultimate achievements when he writes that every figure "moves, and the flesh quivers," and that in his compositions "light and shadow are forever fighting and playing, and the light disappears and diminishes in the same way that it does in nature itself." Vasari is more circumstantial: "Titian's methods in these paintings differ widely from those he adopted in his youth. His first works are executed with a certain fineness and diligence, so that they may be examined closely, but these are done roughly in an impressionist manner, with bold strokes and blobs, to obtain the effect at a distance."

Boschini (1674) speaks at length of Titian's technique. He was aware from the works of Palma Giovane that the latter had "the good fortune to enjoy some of the erudite precepts" of the master. He informs us that Titian "laid the foundations for his paintings in a mass of colors, serving — as it were — as a bed or base for the expression that was later to emerge . . . after laying these precious foundations, he would turn the paintings to the wall, leaving them, sometimes for months, without looking at them: and when he once more put his brush to them, he would scrutinize them with rigorous care as though they were his deadliest enemies, to see if he could detect some fault in them. . . ." Boschini adds that Palma Giovane also attested that in putting the final touches to his works, Titian would paint "more with his fingers than with his brushes."

Far from being prey to the weakness of old age — as was once erroneously maintained by those critics, such as Mengs, Burckhardt, and others of a neoclassic formation, who had not succeeded in understanding the final message of the great artist — Titian was intensely aware of the torment of his search to achieve the sublime. In this respect the fourth "poesy," showing Actaeon being torn apart by his dogs (*Diana and Actaeon*; London, Harewood Coll.), is one of the most powerful expressions of Titian's art. The incautious shepherd, being attacked by the pack of hounds, seems to merge with the bushy shrubs and trees, which are executed with impetuous, broad brushstrokes; the pictorial texture is so alive that it animates everything in the painting.

In 1559 Titian finished two religious works for Philip II of

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

Spain: the *Entombment* in the Prado and the *Adoration of the Magi* in the Escorial. In the first Titian achieves a highly dramatic intensity in the scene, with its haggard and tragic figures surrounding the dead Christ. Another signed version, also in the Prado (No. 411), is probably the painting seen by Vasari in Titian's house in 1566. Other studio replicas of this painting are in Vienna (Kunsthist. Mus.) and Milan (Pin. Ambrosiana). The *Adoration of the Magi*, which has a truly magical atmosphere, is traditional in design but expressed with a sensitivity that is modern. The Prado version is by the artist himself, and there is a good replica in Cleveland (Mus. of Art). Yet another replica, also by Titian, which differs from that of the Escorial in some details — particularly in the landscape — is in Milan (Pin. Ambrosiana). In a letter to Philip II in September, 1559, Titian mentions "a small painting with Christ on the Cross" that his son Orazio was sending the King as a gift. This portable *Crucifixion*, now in the Royal Palace in Madrid, is of such high quality that it is presumed to be a work by Titian himself.

In April, 1562, Titian delivered two more works to the King: the *Rape of Europa* and the *Agony in the Garden*. The mythological subject (PL. 102) is transformed into a fantastic Orphic composition, a vision of silver and blue that transcends any connection with reality. The *Agony in the Garden* is identified by some with the canvas in the sacristy of the Escorial and by others with that in the Prado. The two canvases are coeval and conceived in the same expressive vein, underlined by an extremely bold use of luministic effects, especially the one in the Prado, which anticipates Rembrandt's nocturnal scenes. Probably also painted for Philip II was the *Madonna and Child*, formerly in the sacristy of the Escorial and now in Munich (Alte Pin.). In this work the soft and delicate landscape provides a luminous background for the two figures.

During the 1560s Titian was very active, though he concentrated less on portraiture. It is likely that he painted the figure of Wisdom in the center of the ceiling of the anteroom in Sansovino's Biblioteca Marciana shortly after September, 1559. The *Transfiguration* in the Church of S. Salvatore in Venice may also have been executed in this period, but its poor condition makes a more precise dating and stylistic evaluation difficult. The rather damaged altarpiece *St. Francis Receiving the Stigmata*, in which the donor Desiderio Guidone is portrayed (Ascoli Piceno, Italy, Pin. Civ.), though signed, is largely a studio production. The altarpiece *St. Nicholas of Bari* in the Venetian Church of S. Sebastiano, commissioned by the lawyer Nicolò Crasso, was probably painted after 1563.

By 1564 the *Last Supper*, begun for Philip II in 1558, was finished, but when it arrived at the Escorial (where it hangs in the Chapter House) it was thought to be too large and was cut down. What remains can give but a minimal idea of the original conception, and retouchings have darkened and spoiled the original coloring of the work. In it the figures are arranged with classical symmetry, and the light of the sun focuses attention toward the center of the scene. A copy from Titian's studio in Milan (Brera) gives an approximate idea of the appearance of the painting before it was cut.

The *Crucifixion* in the sacristy of the Escorial, probably painted about the middle of the 1560s, is reminiscent of the Ancona *Crucifixion* of 1558. The sacristy also contained a depiction of Mary Magdalen (now lost), well described by Vasari, which was sent to Philip II in 1561. Titian repeated the theme in the version in Leningrad (The Hermitage), datable about 1565. In these portrayals of the subject the sensuous spirit that pervades the earlier Pitti *Magdalen* gives way to a more religious feeling, in which there are slight exaggerations. There are several versions and replicas, partly by Titian and partly by the studio (formerly Lincolnshire, Brocklesby Park, Earl of Yarborough Coll.; Malibu, Calif. J. Paul Getty Mus.; Stuttgart, Staatsgalerie). The one in Naples (Mus. di Capodimonte) may be the painting sent as a gift to Cardinal Farnese in 1567.

One of the works that most clearly reveals Titian's intentions in his last years is the *Annunciation* in the Church of S. Salvatore, Venice. It was painted before 1566, the year in which Vasari remarked that he found in this painting a lack of "the perfection of his other paintings"; Vasari's judgment indicates that he did not fully understand the highest expressions of Titian's late style. An intense light is diffused throughout the scene like incandescent rain, transhumanizing the holy event. The dazzling angel, with outspread wings, surprises and almost frightens the Virgin as she kneels absorbed in prayer, while a host of angels descends from on high. This work is one of the masterpieces of Titian's maturity.

During these years he also produced the *St. Dominic* and the *Scourging of Christ* (both, Rome, Gall. Borghese), as well as the *Allegory of Prudence* (formerly London, F. Howard Coll.) and the *Judith* (Detroit, Inst. of Arts) — all of which illustrate the innovations in taste of the artist at that time.

The joyous and pagan sense of classicism, which Titian had so happily given expression to in the past, radiantly reappears in the *Venus Blindfolding Cupid* in the Galleria Borghese, Rome, which also houses the earlier masterpiece *Sacred and Profane Love* (PL. 94). Comparison of these two works provides a measurement of the distance covered so far by the artist and an appreciation of his pictorial advances — all of fundamental importance to the future of the art of painting. The *Venus Blindfolding Cupid*, a luminous canvas with grand figures, is executed in accordance with that principle of painting in spots of color which was to be taken up by the impressionists in the 19th century. It seems that within the "thick brushstrokes of color," as Boschini says so aptly, Titian fused the light of the sun, such is the luminosity that emanates from the painted canvas. The subject is expressed with greater simplicity but less effectiveness in the painting in the National Gallery in Washington, D.C., which is undoubtedly a fragment.

Vasari, who was in Venice from May 21 to 27, 1566, observed the following works "sketched out and begun" in Titian's studio: *The Martyrdom of St. Lawrence*; *Christ on the Cross*; a composition titled *Doge Grimani Kneeling before Faith*; three vault paintings with mythological subjects for the hall of the Palazzo Pubblico in Brescia; "a naked maiden bowing to Minerva," which has been identified with the *Religion Succored by Spain* (Prado); a "Noli me tangere"; a "Christ laid in the sepulcher," with the Madonna and three Marys; a self-portrait; and a "half-length figure of St. Paul reading."

The *Martyrdom of St. Lawrence*, placed on the high altar of the Escorial, arrived from Venice in 1567. The composition is related to the work in the Jesuit Church of S. Maria Assunta in Venice, though it differs in the background architecture; but the nocturnal effects are even more pronounced, in keeping with the accentuated violence of the drama. The large *Christ on the Cross*, commissioned by Giovanni d'Anna, is convincingly identified by Suida (1933) with the fragment showing Christ and the good thief in Bologna (Pin. Naz.). Other critics have assigned it to Tintoretto or to Palma Giovane, who actually may have collaborated on it. The painting of Doge Grimani is the votive painting commissioned by Doge Francesco Vernier in 1555 and located in the Sala delle Quattro Porte of the Doges' Palace. Since Vasari describes it as only "begun," and since it was not destroyed in the fire of 1577, it is probable that is was completed in the studio after Titian's death. This theory would also be supported by Boschini's affirmation that several figures were added by Marco Vecellio.

In 1564 Titian was commissioned to paint three large canvases for the vault of the hall of the Palazzo Pubblico in Brescia. The compositions represented Vulcan's forge; Brescia, Minerva, Mars, and three Naiads; and Ceres and Bacchus. Finished in 1567, they were sent to Brescia in 1568. The fact that the Brescian authorities thought the works were not by Titian's own hand gave rise to a series of disputes. Since they were burned in the fire of 1575, it is impossible today to know whether the doubts about their authenticity were well-founded and not the fruit of the incomprehension surrounding Titian's new pictorial vision (the composition of the painting with Vulcan's forge is known from an engraving).

The painting described by Vasari as showing a "naked maiden bowing to Minerva [with] a figure beside her and the sea in the distance with Neptune in his chariot" — a work that

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

Titian is said to have left unfinished after the death of Alfonso I of Ferrara in 1534 — is usually identified with the signed work in the Prado representing *Religion Succored by Spain*. It is possible that the painter returned to it after the victory at Lepanto in 1571, adapting it to the new subject and sending it to Philip II in 1575. This is one of the most important works of Titian's last period. It is a symphony of vivid colors and muted tones, from the gray of the clouds to the pale pink of the dress worn by the personification of Spain, from the silvery tones permeated with pink in the sky to the pearly luster of the sea, reverberating in the deeper tone of the mantle covering the splendid nakedness of the figure of Religion. In the Galleria Doria Pamphili in Rome there is a slightly modified copy of this painting, certainly by some later copyist. A version of the same subject, sent to Maximilian II in 1568, has since been lost.

In the same year, Titian was elected to the Academy of Tuscan Painters, together with Tintoretto and Palladio. The following year Titian presented Cardinal Michele Bonelli with a *St. Catherine of Alexandria* (possibly the signed canvas in the Museum of Fine Arts, Boston) and painted a *Magdalen* for Alessandro Farnese. Titian also sent Pope Pius V a *St. Peter Martyr* (lost), which on the basis of an engraving by Luca Bertelli appears to have varied only slightly from the lost altarpiece painted earlier for the Venetian Church of SS. Giovanni e Paolo.

In October, 1568, Titian informed Philip II that he had finished a canvas depicting Christ and the Pharisee (*The Tribute Money*; London, Nat. Gall.), in which the strong naturalism of the figure of the Pharisee is almost pre-Caravaggesque. In the same year Titian also offered Maximilian II (through Jacopo Strada of Mantua) seven "mythologies," since lost, which repeated the same themes as "poesies" painted for Philip II (see above). Two other works that may be attributed on stylistic grounds to the 1560s are the small altarpiece *Madonna and Child with SS. Titianus and Andrew* in the archidiaconal church of Pieve di Cadore and the signed *Christ and Peter of Cyrene* in the Prado.

Titian was in Pieve di Cadore in 1565 in connection with certain frescoes for the apse of the archidiaconal church, whose execution he left to pupils, among whom were Cesare Vecellio, Emmanuello of Augsburg (Emanuel Amberger), and Valerio Zuccato. Completed in 1567, they were destroyed together with the church in 1813.

In the two paintings of Christ carrying the Cross in the Prado Titian returned to the theme of the disputed early canvas *Christ and the Executioner* in the Scuola di S. Rocco in Venice. A replica by Titian himself exists in The Hermitage in Leningrad. Also in The Hermitage there is a *Christ Blessing* (acquired in 1850 from the Barbarigo Coll.), which recalls the various representations of Christ painted by Titian since his youth, from the Dresden *Christ and the Tribute Money* onward.

It has already been noted that Titian dedicated himself less and less to portraiture in his last years. There are, in fact, few portraits that can be dated after 1560. Two are signed and dated 1561: the *Man with a Palm* (held to be Antonio Palma, father of Palma Giovane) in Dresden (Gemäldegal.) and the *Man Holding a Book* in Baltimore (Mus. of Art, Epstein Coll.). Probably of about the same date are the *Man Holding a Flute* (Detroit, Inst. of Arts) and the portrait of Titian's daughter, Lavinia, as a matron (according to an inscription on the painting) in Dresden (Gemäldegal.). The self-portrait completed in 1562, which Vasari says he saw in Venice in 1566, is very likely the example in Berlin (XI, PL. 218). Two other so-called self-portraits in the Uffizi may be regarded as copies by later followers. The portrait of Jacopo Strada (Vienna, Kunsthist. Mus.) was begun in 1567 and finished the following year. The sitter is portrayed in the gesture of exhibiting a small statue that rests on a table, on which there are also a few coins. This portrait is a penetrating analysis of character, which emerges all the more clearly by virtue of Titian's new luminism and technique. A painting that may also be considered a portrait is the *Child with a Dog*, in which the figures are standing in a landscape with a fire in the background (possibly a fragment; Rotterdam, Mus. Boymans-Van Beuningen). The large dog to which the child clings is the same as that which appears in the portrait of a gentleman in Kassel (Gemäldegal.).

In August, 1571, Titian wrote to Philip II that he had sent him a painting of *Tarquin and Lucretia* (PL. 98). The episode is expressed with dramatic violence, and the figures of the protagonists, towering in their passion, dominate the canvas. A more generalized interpretation is found in the *Tarquin and Lucretia* in Vienna (PL. 101), in which any theatrical quality in gesture or pose has completely vanished, giving way to an extremely intense inner "expressionism." For the poetry of space, nature, and the human figure Titian has substituted the poetry of color, from which spring the most fascinating expressions of his final period.

The same intentions that informed the Vienna *Tarquin and Lucretia* are apparent in the *St. Sebastian* in Leningrad (The Hermitage), a powerful figure created with spots and brushstrokes, generating a warm luminosity against a background in which the colors are agitated as in the turbulent waters of a whirlpool.

The expressionism that characterizes Titian's last works is apparent both in the *Ecce Homo* in St. Louis (City Art Mus.), which repeats the Prado *Ecce Homo* of 1548 in the figure of Christ, and in the Munich *Crowning with Thorns* (PL. 101), which is possibly the canvas that came into Tintoretto's possession on Titian's death. Many replicas of the first work exist, the most famous being that in the Prado, which was mentioned as being in the Escorial in 1574 (still another *Ecce Homo*, stylistically slightly earlier, also hangs in the Escorial). However, the Munich canvas follows the composition of the Louvre *Crowning with Thorns*, painted about thirty years earlier for the Church of S. Maria delle Grazie in Milan, but transforms the scene into an almost mysterious nocturne through the new chromatic conception and a deepening of the drama.

In the *Madonna and Child* in London (PL. 103) the figures are magically depicted in the subtly melancholy enchantment of a color scheme suffused with light. Contrasting with this work is the severe and classical grandiosity of the *Adam and Eve* (Prado), datable between 1565 and 1570, which harks back to the plasticity found in earlier works that show certain suggestions of Michelangelo.

The victory of Lepanto (1571) coincided with the birth of Infante Don Ferdinand, and Titian was commissioned to commemorate these events in the painting *Philip II Offering Infante Don Ferdinand to Victory* (Prado). Documents affirm that Titian was working on this canvas in 1573 and that it was dispatched to Spain in 1575. Against the background of the famous naval battle, crackling with a nocturnal glare, the King raises the child toward the figure of Victory, who is descending from on high with an impetus that calls to mind the earlier *Perseus and Andromeda*, while a Turkish slave lies in chains at the feet of the monarch. According to some scholars, the latter is an addition (or the completion of a figure only roughly sketched) by Vincenzo Carducci, who in 1625 enlarged and restored the painting, with the result that much of its original freshness has disappeared.

One of the highest and most profound creations of Titian's old age is the *Shepherd and Nymph* (PL. 102). In this work the artist, at the close of his long career, has succeeded in grasping the very essence of life and, almost as a summary of that life, expresses himself in a definitive and transcendental language that suggests in a few unforgettable "words" the meaning of existence. The same expression appears in the *Flaying of Marsyas* (Kroměříž, Czechoslovakia, Nat. Gall.): the work is less a fable than a symbology, since the cruel violence of the action and the hallucinatory reddish ghost of Marsyas lose their physical substance in a glowing fume of light.

The last example of Titian's portraiture is the impressive profile of the artist in the Prado self-portrait. His gaunt face is made spiritual by the marks that time has etched in his thin, drawn features and by the slightly dimmed sky blue of the cavernous eyes, the pupils fixed in a stare that seems to look beyond the visible world. It is a face illuminated from within, a face of unbounded wisdom, and the master's hand, surrounded

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

by his voluminous black garment, holds a brush between the fingers.

At this point, aware of his approaching death, Titian asked to be buried in the Chapel of the Crucifix in S. Maria Gloriosa dei Frari, where his fortune had begun with the *Assumption*, and with this wish in mind he promised the Franciscans a painting of the Pietà. The painting was put aside after disputes with the friars, and death overtook the painter on Aug. 27, 1576, before he had completed the work (PL. 101). Finished by Palma Giovane, it was placed in the Venetian Church of S. Angelo and after the demolition of the church was moved to the Accademia. Restoration of the altarpiece has revealed that Palma's contributions to it are rather limited.

Titian's artistic and spiritual last testament lies in this *Pietà*, in which the culmination of the drama is reached in the dominant figure of Mary Magdalene, who with her arms uplifted is crying out her sorrow. The figures are seen against the background of a rusticated portal with a small mosaic semidome of gleaming gold, which is flanked by the powerful figures of Faith and Moses. In the right-hand corner there is a small votive painting of Titian and his son Orazio praying before the Madonna.

The conclusions of scholars concerning Titian's graphic art are still not unanimous. In the 20th century this problem has been discussed by Von Hadeln (1924, 1927), who may be regarded as having laid the foundations for such study, by Fröhlich-Bum (1928, 1929), and by H. Tietze and E. Tietze-Conrat, who have achieved more positive results in their fundamental volume on Venetian drawings (1944).

Even in his initial drawings (IV, PL. 276) Titian's style goes beyond the influence of Bellini and, though subtle, clear, and precise, expresses a completely original animation and force. In these early stages a leaning toward Giorgione's art is evident in the choice of lyrical subjects and especially in his manner of "drawing without outline," as Vasari said, to achieve a more atmospheric effect, as well as his use of a softer chromatic medium, as, for example, in the half-length bust of a woman in the Uffizi. Besides drawing with pen and ink, Titian also began to use charcoal, which was better suited to his pictorial purposes.

By the time of his early maturity the expressive power of Titian's drawing was exceptionally marked, as is clearly illustrated by the two known studies (Berlin, Kupferstichkabinett; Frankfurt am Main, Städelsches Kunstinstitut) for the Averoldo altarpiece (1522) in the Church of SS. Nazaro e Celso in Brescia. In these studies the soft lines of his early drawings are replaced by a more modeled treatment, with the volumes accentuated by incisive intersecting lines. This technique, alternating with instances of still greater economy and dynamism, led toward a style of drawing of ever-increasing rapidity and synthesis that aimed toward new concepts.

Later, toward 1550, Titian's drawing style became more expressionistic, as he sought to convey more the inner spirit of things than their actual physical appearance. At this stage his designs are enmeshed in a multitude of lines that contend with one another in an excited frenzy, so that the very outlines of the figures are lost within the flow of a new rhythm that surpasses the limits of the subjects. The drawings of this period have come to be recognized as the works of a genius who was in advance of his age.

Titian's paintings and drawings were frequently engraved on wood and copper by his contemporaries. It is supposed that Titian himself sometimes drew directly on wood, entrusting the engraving to others. This supposition is accredited by Vasari's discussion of the woodcut of the alterpiece *Madonna and Child in Glory with Six Saints* (Pin. Vat.) for S. Nicolò dei Frari, as well as by a self-portrait engraved by Giovanni Britto, showing the master in the act of drawing on a wood block. The spirit and imprint of Titian's style, which he was able to give to woodcuts, were inevitably weakened by the absence of his direct touch when the engraving was on copper. These were carried out by the etchers alone and with the principal aim of popularizing the artist's works.

Titian had pupils and assistants early in his career. Their collaboration consisted in the purely manual and technical work and in the first draft of secondary elements, which Titian would then work over and finish. The participation of his assistants increased in his mature and late years. As far as is known, many were members of his family or close relatives, as was often the case in the studios of important artists, but, in addition, a number of Venetian and foreign artists collaborated with Titian. When he first opened his workshop in the area of S. Samuele in 1513, Titian brought with him as helpers Antonio Buxei and Ludovico di Giovanni, the latter a former assistant of Giovanni Bellini.

The first of Titian's collaborators was his brother Francesco, who must have worked with him from the time of the frescoes (1510–11) for the Scuola di S. Antonio in Padua, but who was also an independent artist (Morassi, 1956). He is also known to have worked with Titian in the ancient Loggia del Capitanio in Vicenza in 1521. Francesco probably continued to collaborate with his brother from time to time until his death at Pieve di Cadore in 1559 or 1560. One of Titian's most faithful and frequent collaborators was his second son, Orazio (b. before 1525; d. 1576), who accompanied him to Augsburg, Rome, and certainly on other journeys. In his own works, however, he shows himself to be a weak and awkward painter. Cesare Vecellio (1521–1601), son of a cousin of Titian's father, was also an able assistant but a mediocre artist. Marco Vecellio (1545–1611), known as Marco di Tiziano, son of a second cousin, was brought up in Titian's house and helped the master in the last years of his life; but his works show little talent (Valcanover, 1951).

Other collaborators, outside the family circle, were Girolamo Dente, called Girolamo di Tiziano (ca. 1510–ca. 1566), a faithful pupil and capable helper, but himself a limited painter; Jan Stephan van Calcar (ca. 1499–1546/50), whom Vasari refers to as Giovanni the Fleming, an excellent painter, who fled from Flanders in 1536/37 and then remained in Titian's studio for several years; and Lambert Sustris (ca. 1515/20–ca. 1584), variously designated as a Fleming, a German, or a Paduan, an excellent painter who worked with Titian for a short time. Other recorded assistants or pupils were Natalino da Murano and Damiano Mazza (Fiocco, 1929). Among the foreigners were Emmanuello of Augsburg, who became an excellent portrait painter, the German Christoph Schwartz (1545–92), and the Dutchman Dirck Barendsz. (1534–92), about whom little is known. El Greco also worked in Titian's studio for a short time. In the final years of his life Titian was assisted by Palma Giovane, who after the master's death completed the *Pietà* in the Accademia in Venice. Another follower and imitator was Pietro Muttoni, known as Pietro della Vecchia.(1605–78), who sometimes copied works of Titian and Giorgione.

Titian's influence extended beyond the limits of his country and his time, through its effect on such universal geniuses as El Greco, Rubens, Van Dyck, Velázquez, and Rembrandt, whose art would have been inconceivable without the lessons learned from Titian. His art was admired in the 18th century, but only in the second half of the 19th century was his ultimate style "rediscovered" and understood.

In about seventy years of artistic activity Titian created a great number of masterpieces and exceeded the production of any other great artist, including Rubens, Rembrandt, and Goya. Titian's genius exploded with incredible precocity and remained at a summit of excellence as a result of the incessant search for perfection until his death. Any division of Titian's *œuvre* into periods is arbitrary, having only a scholarly significance and practical intention. In reality, there were no real breaks in his development, nor were there any substantial changes in direction. An over-all analysis of his art reveals instead an enrichment of ideas through new contacts, new horizons, and exploration in new fields, as well as a rethinking of youthful attitudes and reelaboration of themes in different keys. There were, however, no breaches in the continuity of his vision of the world. Titian's pictorial faculty was extraordinarily rich, enabling him to depict the lyrical, the dramatic, the epic, and the sacred or profane. His portraits are documents of a live, attendant humanity. His perception of nature, ever acute and

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

truly Pandean, coexists with a sincere religious feeling, and it is perhaps owing to the latter that Titian's art, especially in his late works, reaches into the most intimate regions of existence, to the borders of a world that ceases to be apprehended by the eye by being transformed into sensations and metaphysical significance.

Nevertheless, it is necessary to divide Titian's pictorial development into periods for better understanding of his art. In his first period, while developing the ideals and especially the lively color effects of Giorgione in a more naturalistic and direct manner, Titian also established a new Phidian canon of human beauty and incarnated the forms with warm and tender flesh colors, without the vividness and detachment of those used by Giorgione, who created, on the contrary, a broader range and more elegiac fusion. Titian's art of this period, with its fluent use of color and its sensitive and delicate touches, constitutes an enchanted vision of the real world freshly discovered by a young spirit and captured in images of glorious joyfulness.

In his middle period, stretching approximately from 1520 to 1545, Titian furthered his youthful achievements with more vigorous accents. His conception of the human figure grew progressively less hedonistic and was in essence endowed with a new dignity. His color, which remained vibrant, became denser, at times almost monochromatic, through a completely new technical procedure that was of fundamental importance for later centuries. The lyrical sense of the world was almost imperceptibly replaced by a greater awareness of the tragic in life.

In his last period the spirituality of his art became more intense. Through a process of synthesis he established a deeply personal language that gave his painting a new expressive life. The figures of Titian's last years, phantoms evoked by a spirit dedicated to another, eternal existence, were no longer tangible bodies, but immanent apparitions of sublime moral significance, aloof from triviality as if immersed in the burning essence of another universe.

The style of Titian's last years was understood neither by his contemporaries (except for Tintoretto), who, like Palma Giovane, merely imitated some of its external aspects, nor by those who came after him, with a few exceptions, most notably Rembrandt and a few other extraordinary artist spirits. It was not until the middle of the 19th century that his true greatness began to be understood.

TOMMASO DA MODENA. The painter Tommaso da Modena, son of Barisino dei Barisini, also a painter, was born at Modena in 1325 or 1326; he died shortly before 1379. His early years seem to have been divided between Modena and Bologna, where he may have received his early training in the workshops of miniaturists, perhaps in that of Nicolò da Bologna. In 1349 he is known to have been in Treviso, where he spent considerable periods thereafter. Some scholars (Bertoni and Vicini, 1904, 1917; Venturi; Berenson, 1932) believe that Tommaso also traveled to Bohemia, where the decoration of the Chapel of the Holy Face in Prague has been attributed to him; however, others (Schlosser, 1898; Coletti, 1963) deny that he was ever in that country, although there are indisputable connections between Tommaso's art and Bohemian painting of that period.

Probably among Tommaso's earliest works are the fresco fragment with three saints in the Cathedral of Modena; the panels framing a small altarpiece or reliquary in Baltimore (Walters Art Gall.); and a portable altar in Modena (Gall. Estense). The latter, which bears a partially indecipherable date that is probably 1345, shows contacts with Bolognese and Tuscan painting and indicates some uncertainty of direction.

In Treviso, early works include the fresco of the Mystical Marriage of St. Catherine and another fresco of the same saint in the Church of S. Caterina, which carry echoes of Vitale da Bologna (q.v.). The frescoes portraying illustrious Dominicans (PL. 105), made for the chapter house of the Dominican priory, date from 1352; in the subtle interpretation of the setting, they exemplify the most vigorous and expressionistic element of 14th-century Bolognese painting, and the powerful physiognomical characterization is unequaled in Italian painting of the time. From the same time or a little later are three frescoes in the Church of S. Nicolò: St. Jerome, St. Romuald, and SS. Agnes and John the Baptist (PLS. 104, 105), distinguished from the later frescoes by their refined, almost calligraphic detail. But there are also serene, vigorous forms that are given admirable expression in the St. Agnes and in a Virgin (restored) in the Church of S. Lucia. In a fresco of the Virgin with saints in the Church of S. Francesco, the powerful, restless artist broke the usual symmetry; the types are rendered in a warm, intense range of colors, the robes fall in deep folds, and the 14th-century Gothic idiom is transfigured by the painter's very personal naturalism and the subtle chiaroscuro that shapes the solid figures. In these frescoes there are hints (as in the cloak of the Virgin) of a taste that was to be developed in the second half of the century for the tonal contrasts afforded by the rippled edges and sharply broken folds of robes (a device seen in Bohemian painting in the first half of the century).

The triptych and diptych now in the Chapel of the Holy Cross in the castle of Karlštejn (PL. 106) are definitely later than 1356; the Virgin is of the same buxom, sensual type as the women in the probably later St. Ursula frescoes (PL. 107), but the Child is purely Sienese. To the same period seem to belong the small polyptych in the Pinacoteca of Bologna, characterized by a grave and balanced feeling for form and space, and a panel with SS. James the Great and Anthony of Padua in Verona (PL. 106). Toesca (1912) has attributed to Tommaso the frescoes of about 1360 in the Church of S. Francesco in Mantua narrating, in a tranquil and spacious style, legends of a Franciscan saint, although they show some differences from the Treviso frescoes.

In the cycle of St. Ursula (PL. 107; VI, PL. 361), the subject has stimulated a remarkable narrative treatment. The dominance of the human masses — which nearly overflow the frames in these crowded scenes — over the architecture shows unquestionable links with Bolognese painting as interpreted by a brilliant follower of Vitale da Bologna and of Jacopino de' Bavosi's lively style; the dating of this famous cycle may therefore fall between 1360 and 1366 rather than earlier. This Bolognese influence is confirmed in the scene of the abdication of the pope and in the gesture and the heightened characterization of the baptizing figure in the scene of the baptism of the English prince, which is reminiscent of the St. Joseph in Vitale's *Nativity* (PL. 376). In this St. Ursula cycle Tommaso attained an extremely flexible art that not only interprets the characters but also subtly captures the animated gesticulation (with more restraint than the Bolognese works) and emphasizes the climactic moment of the action with an immediacy that is found again only in Carpaccio (q.v.). The figures are caught in the act of speaking, their lips parted; one senses the whispers of the women and the buzz of the gesticulating crowd, in which the animated grimaces of the old stand out, all contributing to the unforgettable liveliness of Tommaso's art.

The powerful *Decapitation of John the Baptist* (PL. 107) in the Cathedral of Trent (unquestionably Tommaso's) was executed after 1368. A panel with Virgin and Child in the Saibene Collection in Milan, a miniature of the same theme in the Roberto Longhi Collection in Florence, a Man of Sorrows panel in the Episcopal Palace in Treviso, and the fresco fragment of a bishop-saint in S. Caterina in Treviso can be considered authentic works of Tommaso; the appreciably inferior fresco of the Virgin with St. Catherine in S. Caterina in Treviso, the detached fresco of the Virgin in S. Agostino in Modena, and other frescoes in Treviso must be attributed to his workshop. The drawings in the Albertina in Vienna and those formerly in the Ecole des Beaux-Arts in Paris (now lost) must be attributed (Toesca, Tr) to the school of Verona.

Coletti (1924–25, etc.), the most dedicated and sensitive student of Tommaso's work, saw in the great Lombard painter the first example of physiognomic "objectivism," earlier than the Flemish and of great importance for the painting and illumination of the Po Valley as well as for the development of the International Gothic style.

TOSA SCHOOL. Japanese school of painting originating in the 14th century. This was the only school to continue working in the tradition of Yamato-e (q.v.), which had played an important role in the painting of the late Fujiwara (898–1185) and the Kamakura period (1185–1333), but was overshadowed by ink painting (*suiboku-ga*) in the Muromachi period (1334–1573). The Tosa family of the 17th century, aiming to glorify their heritage, claimed as their ancestor the Yamato-e painter Fujiwara Tsunetaka (second half of the 12th cent.). The evidence, however, is not sufficient to prove a direct line of descent from this artist. Regarded by some as more likely to have been the originator of the Tosa school is the artist Fujiwara Yukimitsu (active 1352–71), who held the post of *edokoro azukari* (head of the painters' bureau). But Yukimitsu's family lineage is not clear; nor is it likely that he called himself by the name of Tosa.

Much more clearly understood are the life and work of Yukihiro (d. ca. 1434), who is sometimes recorded in the Tosa family's genealogy as son or brother of Yukimitsu. Yukihiro's name, with the title Tosa Shōkan (lord of Tosa), appears frequently from 1406 to 1434 in the official records of the court and of the Bakufu (military government). Thus there are firm grounds for regarding Yukihiro as the legitimate founder of the Tosa family. His *œuvre* is recorded in various contemporary literary sources, which contain numerous references to his Buddhist paintings and portraits. There are also some works by Yukihiro extant. He was one of a group of six painters — the others being Fujiwara Mitsukuni, Kasuga Yukihide, Rokkaku Jakusai, Awataguchi Ryūkō (also called Takamitsu), and Eishun — who worked in 1414 on the *Yūzū Nembutsu Engi* (Legend of the Echoing Nembutsu), a painted hand scroll, or *emaki* (Kyoto, Seiryōji), which was later abundantly reproduced in the form of wood-block prints.

Yamato-e was a type of painting that appealed to the aristocracy; its decline was inevitable during the Muromachi period, since the country was ruled by the warrior class (*buke*) and the court nobles performed a continually diminishing role in every phase of Japanese life. Nonetheless, the system of *edokoro azukari* survived at the court, and the Ashikaga shoguns of the Muromachi period even adopted the system for the Bakufu. Occupying the post of *edokoro azukari* as a hereditary office, the Tosa family could boast the oldest artistic heritage in the history of Japanese painting. Their monopoly of the highest position to which an artist could attain contributed to their becoming the most powerful school among the artists working in the Yamato-e tradition. Further prestige accrued to them from the naming of Yukihiro, Hirokane (active 1457–65), and some other members of the family as *edokoro azukari* of the Ashikaga shoguns as well as of the court; thus they enjoyed the patronage of both the aristocracy and the warrior caste.

The most important artist of the Tosa school, and the artist who established the family's pictorial style, was Mitsunobu (1434–1525). Said to have been the son of Mitsuhiro and grandson of Jukihiro, Mitsunobu was appointed *edokoro azukari* in 1469. In succeeding years he was honored with a number of high official titles rarely bestowed on artists. Mitsunobu's position was further strengthened when, in 1518, he inherited the post of *edokoro azukari* of the Bakufu. Not only was Mitsunobu held in high esteem in official circles; he also established close personal friendships with many influential court nobles. Because some of these titled friends kept diaries and day-by-day accounts of events at the court, Mitsunobu's activities there are well documented. Throughout his long career Mitsunobu maintained his standing as the greatest and most respected living Yamato-e painter. His *œuvre* covers a wide range: he painted Buddhist icons, *emaki*, large screens, and portraits of royalty. The most famous of the extant Buddhist paintings by Mitsunobu is a set of ten hanging scrolls representing ten kings of hells (PL. 111). The paintings of the ten kings (Jūō) are executed in brilliant colors and accented by strong brushstrokes in the manner of Kara-e (Chinese-style ink painting). The style of this set of scrolls influenced Mitsunobu's followers and became typical of the Buddhist paintings of later Tosa artists. By combining the strong play of Chinese ink and the bold brushstrokes of Kara-e with the brilliant colorism of Yamato-e, Mitsunobu created a totally new effect that was to dominate Japanese painting for many years to come. He is said to have been inspired to develop this style by Kanō Motonobu, who is believed to have married his daughter. This marriage seems to have given fresh inspiration to the Kanō school (q.v.) as well. Motonobu, Masanobu, and some other members of the powerful Kanō family also worked occasionally in the Tosa manner, and the mixing of these two opposing styles served to open a new avenue to the Kanō artists.

Among the portrait paintings by Mitsunobu are one representing the emperor Go En-yū (1397–1470?), painted in 1492 (Kyoto, Unryu-in Monastery), and another representing Momoi Naoaki, a famous dancer (Tokyo, Nat. Mus.). Mitsunobu's forte, however, was the narrative painting of the *emaki*. He painted many of these hand scrolls, the most famous being the *Seikōji Engi* (History of the Seikōji) in the National Museum in Tokyo; the *Tenjin Engi* (Legend of Tenjin) of 1503, in the Kitano Shrine in Kyoto; and the *Kiyomizudera Engi* (also known as *Seisuiji Engi*, or History of the Seisuiji) of 1517, in the National Museum in Tokyo. He also painted a fourth scroll, to replace one that had been lost, for the set of the *Ishiyamadera Engi* (History of the Temple of Ishiyamadera), in the Ishiyamadera (Ishiyama, Shiga prefecture). Apparent in these narrative paintings are Mitsunobu's special skill in portraying human activities set against the rustic countryside and his gift of capturing the warmth and charm of the religious life and sentiment of the rural folk.

The artistic tradition established by Mitsunobu was continued by his son and pupil Mitsumochi (d. ca. 1550), whose name is also read Mitsushige. About 1523, Mitsumochi was appointed *edokoro azukari*. Like his father, Mitsumochi demonstrated a versatile skill. He painted Buddhist icons, such as those dating from 1536 in the Daigoji in Kyoto; in 1550 he decorated the walls of a Buddhist monastery at Kannonji in Shiga prefecture; and he produced many other paintings in a courtly narrative style, the finest being the *Kuwanomidera Engi* (History of the Kuwanomi Temple; PL. 112). Landscape details and figures in the *Kuwanomidera Engi* closely resemble those in the work of his father, but Mitsumochi went a step further in creating the decorative and brilliant effect so typical of the later phase of Yamato-e. This aspect of Mitsumochi's style is particularly evident in a pair of screens representing pines on a beach that has traditionally been associated with his name (Tokyo, Coll. J. Kosaka).

The civil wars toward the end of the Muromachi period caused a disintegration of the social structure and threatened the political supremacy of the Ashikaga shoguns. Mitsumoto (1530–69), the eldest son of Mitsumochi, was appointed *edokoro azukari* in 1541; he probably held the corresponding post under the Bakufu since he later joined the shogun's army. He was

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

killed in battle in 1569, and his death signaled a temporary interruption in the Tosa monopoly of the office of *edokoro azukari*. On the sudden death of Mitsumoto, Mitsuyoshi (1539–1613), believed to have been a younger brother, lost his connection both with the court and with the Bakufu and was obliged to move away from Kyoto in search of new patrons. In Sakai, a bustling port city south of Osaka, Mitsuyoshi ultimately secured the patronage of rich merchants. At times, however, he was constrained to work as an assistant to the Kanō painters, the rivals of the Tosa family. Only a small number of Mitsuyoshi's works survive. The finesse of his careful, minute style is well exemplified by an album of the *Tale of Genji* (Gengi Monogatori) in the National Museum in Kyoto (PL. 109). Illustration of the *Tale of Genji*, the greatest literary masterpiece of ancient Japan, in small album form became almost a trademark of the Tosa family, and many later Tosa artists excelled in it. Mitsunori (1584–1638), a son or pupil of Mitsuyoshi, managed to return to Kyoto about 1634, accompanied by his young son and pupil Mitsuoki. Mitsunori's fragile and delicate style is known to many through the album of the *Tale of Genji* in the Freer Gallery of Art, Washington, D.C.

The incessant warfare of the Momoyama period (1573–1615) brought about a drastic change in the nation's political and social conditions. Inspired by the taste of the ruling war lords, a bold and brilliantly decorative style of painting on large-scale screens emerged. During this period the Tosa family was on the verge of extinction. But their prestige and prosperity were revived in the Edo period (1615–1867), largely owing to the talents of Mitsuoki (1617–91), who was appointed *edokoro azukari* of the court in 1654. Thus renewed, the ancient family tradition was to continue to the 19th century. In choice of subject matter, use of brush and color, and composition, Mitsuoki's paintings reflect a successful blending of the Chinese style of painting and Yamato-e. His fame rests on his delicate paintings of flowers and birds executed in minute and meticulous brushstrokes with fine and delicate colors, preeminent among them the paintings of quails (PL. 110). In these flower and bird paintings by Mitsuoki there are echoes of the style of a Chinese painter of the Southern Sung dynasty, Li An-chung (III, PL. 266). Mitsuoki also painted many large screens and *emaki*; his most famous hand scrolls are the *Tenjin Engi* (Legend of Tenjin) in the Kitano Shrine, Kyoto, and the *Ōdera Engi* (History of the Temple of Ōdera) in the Aguchi Shrine, Osaka.

Mitsuoki's style was maintained until the 19th century by his followers, who continued his specialty of charming, genteel pictures of birds and flowers. Their work, including the paintings of Mitsuoki's son Mitsunari (1646–1710), tended to be formalized and academic.

An artist who did not belong to the Tosa family and yet claimed to be an artistic descendant of Mitsunobu was Iwasa Matabei (1578–1650), also known as Katsumochi or Shōi. Matabei signed his name as the "later stream of Mitsunobu" on one of the votive tablets of the Thirty-six Poetic Immortals (Tōshōgū, Kawagoe, Saitama prefecture). But there is no evidence that Matabei studied with any of the Tosa artists. Indeed his paintings show an indebtedness to works of the Kanō, Unkoku, and other schools (PL. 113). By signing himself as he did, he probably meant to indicate that he was inspired by the ancient masters of Yamato-e as represented by Mitsunobu.

The traditional Tosa style was practiced more faithfully by Sumiyoshi Jōkei (1599–1670), formerly known as Naiki and Hiromichi; he was a follower of Tosa Mitsuyoshi and claimed to be a younger brother of Mitsunori. Jōkei went to the new capital city of Edo (present-day Tokyo) in 1662 to serve the Tokugawa shoguns, and he broke away from the Tosa family to found a separate school of his own, taking the name of Sumiyoshi at the command of the emperor. He had a strong interest in preserving the ancient tradition of Yamato-e, and in 1626, with the help of other artists, he made copies of 20 remaining scrolls of Tokiwa Mitsunaga's Scrolls of Annual Rites and Ceremonies (*Nenjū Gyōji Emaki*) of the 12th century. In 1682 Jōkei's son, Gukei (1631–1705), was made *oku-eshi*, one of the most respected and coveted appointments under the Tokugawa shoguns, and he played an important role in popularizing Yamato-e in Edo. His screen painting *Rakuchū Rakugai Zu* (Inside and Outside Kyoto) in the National Museum in Tokyo accurately and vividly depicts life in the ancient capital of Kyoto.

The late Tosa style evinced little creative or inventive energy during the 18th century, but in the 19th century a last sparkle of life was produced by a group of politically minded artists who did not belong to the Tosa family. To this group, later known as the Fukko Yamato-e (Revivalists of Yamato-e), belonged Reizei Tamechika (also known as Okada Tamechika; 1823–64), Tanaka Totsugen (1768–1823), and Ukita Ikkei (1795–1854). Their aim was to revive the ancient Yamato-e tradition of the Fujiwara and Kamakura periods, and for this reason they made copies of old *emaki* and painted mainly historical subjects. Their esthetic ideals also reflect the political ideology of the loyalists of the late Edo period, who advocated and worked for the restoration of the sovereignty of the imperial house.

Here the long artistic life of the Tosa school ends. Although it had stimulated the birth of new schools of painting — such as the Sōtatsu-Kōrin, the Sumiyoshi, and the Fukko Yamato-e — which derived from it the impetus to create new styles, the Tosa school was to gain no new followers, principally because of the innumerable Western styles of painting that reached Japan from Europe and America at the end of the 19th century and the beginning of the 20th.

TOTEMISM. At the end of the 19th century the term "totemism" was introduced to describe an aspect of the social and religious organization of many primitive peoples. According to the most current interpretation, totemism consists in an emotional relationship that, at the most archaic levels of history, is created between single individuals (or groups of individuals) and animate or inanimate manifestations or elements of nature. The phenomenon, however, appears to be far more complex and elusive, and progress in research has resulted in the dismissal of interpretations that are too inclusive or too unilateral. A similar process in criticism has taken place in regard to the artistic expressions of totemism. Just as it was once believed that in totemism a very ancient or even primordial form of religion had been discovered, so the expression "totemistic art" was coined as being synonymous with an embryonic stage of man's esthetic manifestations. The word "totem" in many contexts replaced that of "idol" or "fetish" to designate many of the sculptural and pictorial creations of peoples of a low level of culture. Such interpretations have now been abandoned or at least deprived of a great part of their substance. In the present article those artistic manifestations formerly designated as totemistic on the basis of uncritical evaluations are not dealt with. The purpose of the article is rather to clarify the meaning and limits of the concept of totemism as it is presently accepted by scholars and to discuss the legitimacy of its extension to artistic manifestations.

SUMMARY. The problem of totemism (col. 162). Artistic manifestations (col. 165).

THE PROBLEM OF TOTEMISM. The concept of totemism — a phenomenon whose great ideological and social complexity and whose variability from one people to another soon became

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

apparent — was the object of divergent theories even in the early phases of its discovery and analysis. The definition that has found greatest favor is probably that of J. G. Frazer (1910): Totemism is to be understood as an emotional relationship between an individual or a group of individuals on the one hand and certain manifestations of animate and inanimate nature on the other, which may in certain cases be expressed in the belief in a common descent.

A better and more convincing definition of totemism could hardly be found, yet it does not adequately cover the multitude of totemistic forms. The totemistic relationship was first ascertained among the North American Woodland Indians; on the basis of their culture and the cultures of the Australian tribes and territorial groups that were subsequently discovered, the following conclusions may perhaps be drawn: What is, rightly or not, known as totemism is substantially a concept that does not yet single out man and his social alliances and cultural achievements from the comprehensive processes of nature. In a philosophical sense mankind, his animate and inanimate environment, and the universe are seen as an entity. In such a view, oriented to the wholeness and indivisibility of the world and cosmos, may lie the key to an understanding of the so-called "totemistic relationship," that is, of a bond — hardly explainable rationally — between single individuals or social units and particular species of animals and plants and other forms of nature that are significant to man's life rhythm or stimulate him to meditation.

It is principally among the nomadic hunting and food-gathering tribes — but also among agricultural peoples and the cattle-raising nomads of all continents except Europe — that totemistic concepts can develop into a cultural or ideological system according to the above definition. This fact stimulated the older diffusionist schools of ethnology to speculate on the origins and historical age of totemism. These schools attributed the origins of totemistic ideas to the hypothetically oldest stage in the history of mankind, in which the economy was on a hunting and food-gathering level. The appearances of these ideas in the so-called "later strata," the cultivating and cattle-raising cultures, were interpreted as vestiges or survivals. More recent ethnology and cultural anthropology, grown more modest in their aims and more mature, have recognized that it is just as difficult to draw definitive conclusions regarding the origins and age of totemism as it is to define the inception of social life, productive farming (cultivation and cattle raising), political organization, etc. Other scholars contributed one-sided and therefore inadequate observations to the study of totemism because they overemphasized either the religious or the social aspect.

Nearly all authors agree at least that the concepts and the thinking processes classified as totemistic are distant from those of modern man and that they can perhaps be considered "archaic." This point of view has been questioned, however, in a study by Lévi-Strauss (1962). For this author, totemism as the expression of certain spiritual and social needs represents a concept that is rooted in a dualistic vision of the world and is shared to some extent by Europeans as well. For this and various other reasons, he believes that the existence of totemism should be questioned, the concept being merely a theoretical construct of scholarship. Nevertheless, all the phenomena of the spiritual and social life of primitive peoples recorded and studied as totemistic by whole generations of scholars remain a reality.

The word "totem" (derived from *ototeman*) was borrowed from the language of the Chippewa (Ojibwa), a North American food-gathering and hunting tribe in the area north of the Great Lakes belonging to the ethnic and linguistic group of the Algonquians. It means approximately "it (he) is of my kin" and defines specific social relationships based on tribal mythology. The original clans in Chippewa mythology were traced back to six supernatural beings, which in the beginning of time came forth from the water and presented themselves to the primordial Indians. One of these returned to its element, the sight of it having killed a living man. The others remained in this world and acted as the bearers of culture to the Indians. They became ancestors of the totemistic Chippewa clans: fish, crane, grebe, bear, and marten; that is, the supernatural beings were identified with these animal species or interpreted as their lords or spiritual representatives. It is patently a concept that, when projected into the domain of cult and religion, draws no sharp lines between the world of man and that of animals. Besides this totemistic relationship, which may be described as indirect and collective and which associates mythically and perhaps mystically specific social groups with specific animal species of water, earth, and air, the Chippewa have totemistic relationships that can be considered direct and individual. These involve the tutelary and helping spirits which the individual wins for himself through certain experiences of a supernatural sort and which likewise belong to the animal world. But these are not so much the actual animal species as their "spirit doubles," that is, their essences in the world of the invisible. Identical or similar concepts, which comprise individual as well as collective (direct and indirect) totemistic relationships, are found not only among the Chippewa and other hunting tribes of the Algonquian tribal group but also in those North American ethnic units which, at various periods of history, established themselves as farmers (for example, the Iroquois of New York State).

The totemistic ideas of the hunting and food-gathering tribes of Australia, who with the North American Indians are considered the representatives of a classic totemistic concept of existence, derive from the same principles. In an even more comprehensive and radical way than in North America, totemism in Australia creates specific collective and individual bonds both in the social domain and in that of cult and religion. The essential concept of totemism — the common mythical ancestorship of man and forms of his natural surroundings — has found its clearest and most evident expression in the central and northern areas of Australia. There is hardly an element in the natural or supernatural world that cannot become a totem and thereby a symbol or expression of the above-mentioned partnership between man and the world into which fate has set him. Thus it is not at all surprising that, among other things, supernatural beings, hurricanes, poisonous snakes and insects, sickness, weapons, domestic implements, and recently, owing to contact with the white man's civilization, products of technology such as airplanes and automobiles are incorporated into the totemistic concept. This phenomenon, almost without comparison in totemistic societies outside Australia, would seem to refute a widespread theory according to which social groups give preference to edible animals as totems, the animals' utility being, in other words, a decisive factor.

According to Elkin (1954), Australia's totemic system comprises the following four types: (1) Sexual totemism. Each of the sexes allies itself to one or more totems that make manifest the contrast to the other sex. (2) Clan totemism. Social units of varying strengths, organized on territorial as well as supraterritorial bases, have their own totems, which become the expression of their group solidarity. (3) Class, or tribal-halves, totemism. Most Australian single tribes, tribal groups, and territorial groups are dichotomous, that is, they are organized into two exogamous classes, or halves, which in certain cases (particularly in the southeastern, central, and northern areas) are further subdivided into four or even eight subsections. This complicated class system, which like the clan system is anchored in totemism, is decisive for marriage arrangements; membership in a given class, section, or subsection determines, at least theoretically, the choice of marriage partner. Sexual totemism, which is basically confined to the southeastern and northwestern territories of Australia, as well as clan totemism and class totemism, allocates to the respective groupings — that is, the collective societies — their particular places in social and cult life and in addition forms an invisible bond between the human groupings and their natural environment on the one side and their mythicohistorical past on the other. (4) Individual totemism. This form of totemism assumes the task of placing the individual, freed from his various collective bonds, in harmonious contact with the forces of nature as well as with the supernatural world. In Australia and North America, as well as in Arctic Siberia, it is chiefly shamans, medicine men, proph-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

ets, or inspired mediums who become the conveyers of the so-called "individual totems." These totems are generally stylized images of animals (especially snakes), various kinds of stones and crystals, or numinous anthropomorphic beings, which take over the role of personal tutelary or helping spirits. While collective or social totems (indirect totems) — which may be designated as institutional — are handed down patrilineally or matrilineally, the individual totems are usually, as in North America, the result of personal dream or trance experiences, that is, they must be won by an act of will through contact with the forces of creation and of the beyond.

All these phenomena seem to indicate that the so-called "totemistic" concept among the North American Woodland Indians of the past and, to a far greater extent, among the Australian aborigines played a major part in molding the cultures of these peoples. The various totemistic affiliations, binding the individual and the social formations, not only place man in a close relationship with nature and the cosmos but also provide him with his status within the cult and the secular life of his society and, in addition, relate him to the mythico-historical past of his group and to the forces of creation, fertility, and procreation which proceed from the group and whose timeless efficacy he must continually reaffirm by ceremonial rites.

Totemistic systems of such vast proportions, which bestow expression and structure upon the religious, social, and, to some extent, political and economic spheres of given traditionalist cultures, are rarely found outside the above-mentioned areas. In Melanesia — for example, New Ireland, the Trobriands, the Santa Cruz archipelago — the island societies have clearly defined totemistic relationships. The mythical ancestors of the clan or village community, sprung from the earth or the sea, are identified with certain natural species (generally animals, more rarely plants). Similar beliefs exist in Polynesia, an area whose culture differs fundamentally from that of the hunting and food-gathering tribes of the North American Indians and Australians and from that of the Melanesians with their horticultural economy. The island cultures, especially those of central and northern Polynesia, are distinguished by strict political organizations, based on an aristocratic hierarchy, a sacred kingship, and a class of theologically educated priests. In other words, totemistic ideas and lines of thought can be traced even in civilizations classed by many authors as "high cultures." Although in such cultures these ideas do not represent a phenomenon *sui generis*, they still determine the general picture of the relationships between man and the elements of nature (Firth, 1930–31).

With few exceptions the totemistic systems that are known among African societies are similar to those in Melanesia and Polynesia. Among the West African Tallensi (Fortes, 1945) and Dogon (Griaule, 1937), the Azande of central Africa (Baxter and Butt, 1953), and the East African Nuer (Evans-Pritchard, 1956), the totems of social groups and of individuals become almost abstract symbols of the human being, of his ancestors and their immortality. It is a totemistic relationship that, in varying degrees, is purely external and formalistic and only incidentally expresses certain similarities between specific human and animal types.

ARTISTIC MANIFESTATIONS. It is to be expected that such a widespread complex of concepts and traditions as totemism, which influences the religious-philosophical and social life of sizable groups of humanity in various parts of the world and may even determine the totality of a culture (North America and Australia), should naturally also influence artistic activity. It is, however, doubtful whether one can speak of a totemistic art. For example, in the art of the North American Woodland Indians the relationship between the sculptural works and conventional two-dimensional motifs on the one hand and the totemistic concepts and life principles on the other cannot always be ascertained. It can be proved, in fact, that the famous "totem poles" of the Indians of the northwest Pacific Coast (X, PL. 356), monumental and bizarre carvings with polychrome painting, have nothing to do with totemism.

In Melanesia, too, it is difficult to establish the existence of a totemistic art. Examples of sculpture such as the wooden bowls in the shapes of animals of the Admiralty Islands and of San Cristobal in the Solomon Islands (PL. 117) or realistically represented crocodiles decorating the prows of river canoes in New Guinea were interpreted as totemistic without clear evidence for such associations. In the ethnological sciences the opinion was (and to some extent still is) widespread that naturalistic or stylized representations of animals in primitive art prove the existence of totemistic concepts. But this is an oversimplification of the question. Clear totemistic references are, however, evident in the conventional motifs on the dance clubs of the Santa Cruz islanders (PL. 114), in the so-called "taro masks" and bull-roarers from southern New Guinea and the Solomon Islands (PL. 114), and particularly in the artistically executed and brightly painted *malanggan* carvings from New Ireland (PLS. 115, 116; IX, PLS. 447, 448, cols. 714–715), which, as representations of totemistic associations, are at the center of cult life in some of these Melanesian social groups (see MELANESIAN CULTURES).

Some certain — and some questionable — associations between reputed totemistic art and social or cult totemism have been exemplified also in Africa. A greatly varied art consisting of masks and sculpture, both in the round and in relief, exists in the Congo region and the West African countries; that is, in cultural areas with strict political organizations based on sacred chieftaincies or kingships (see BANTU CULTURES; GUINEAN CULTURES; SUDANESE CULTURES). Prevalent are stylized and naturalistic representations of animals (PL. 117), which have been interpreted by scholars as tribal or clan emblems symbolizing the relationships between the social groups and their mythico-historical origins. The totemistic concepts, insofar as they can be considered as such, seem to be more or less intellectualized here and are undoubtedly of secondary importance within the over-all cultural picture.

In Australia, on the other hand, where totemism has acquired an all-embracing significance and has influenced all fields of life, every kind of artistic activity seems to be inspired by it. The conventional motifs of an abstract or naturalistic nature decorating objects of daily use, such as household utensils, tools, and arms, always refer to primordial traditions concerning the activities of totemistic ancestors as creators and bearers of culture. These connections between living generations and the beings of their mythical past — who are conceived as the timeless personifications and activators of procreation and fertility — assume particular features in the cult and ceremonial life of social units both large and small. This is true particularly in central, western, and northern Australia, where the cults are centered around sacred objects of stone or wood, complicated sand drawings, and occasionally rock paintings and engravings (see AUSTRALIAN CULTURES). The sacred objects entered ethnological literature under the designation of bull-roarers and churingas, the latter a term borrowed from the language of the central Australian Aranda (Arunta). They are considered the embodiment or the tools of the totemistic primordial ancestors and become for their owners, both as individuals and as members of a collective group, transmitters of the vital force and guarantors of life's security, that is, symbols of a continuity connecting the present with the period of beginning and creation. The geometric motifs decorating them (concentric circles, parallel curved lines, semicircles, etc.) are to be understood as a kind of ideogram, representing certain local mythological traditions (II, PLS. 66, 67, FIGS. 131, 135, cols. 134–136).

A related or identical significance is attributed by many aboriginal groups to their rock engravings and polychrome or monochrome rock paintings (II, PLS. 64, 66, col. 132; X, col. 493). With their varied compositions of symbol-like signs and abstract or naturalistic images of anthropomorphic beings and of plant or animal species, these pictures portray the totemistic traditions of the related social groups or individuals. From such concepts arises the function of the rock pictures as centers of ritual activity for ensuring the increase of totemistic species and as influential forces in the annual rain making — a function, however, that can be documented with certainty only for northwestern Australia.

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

The polychrome bark paintings (PL. 114; II, PLS. 61, 65, col. 133; X, col. 493) and the figurines of men and animals from the Kimberleys and Arnhemland in northern Australia are to be considered special cases; they are not found in the other regions of Australia. Since nothing definite is known about the historical origins of these atypical art forms, they must be regarded as local manifestations, at least in respect to their form, technique, and expression. As to their meaning and significance, they fit perfectly into the over-all complex of Australian totemistic traditions.

Only in Australia is all artistic expression inspired by a concept of the world that draws only vague boundaries between man, nature, and the cosmos and on occasion ignores as immaterial the categories of time — that is, the differentiation between past, present, and future. It is therefore only in Australia that a totemistic art can be said to exist in the true sense of the word. In other parts of the world, where totemistic concepts are known to influence the social and spiritual life of human groups to varying degrees, as in Oceania and Africa, the art may seem to indicate totemistic references in its sculptural and pictorial representations of animals, plants, cosmic phenomena, and mythical beings, but these prove to be associated with concepts that are in no way totemistic. Totemism may avail itself of art as one of its mediums of expression, but so far the existence of a purely totemistic art cannot be proved.

Helmut PETRI

A particular kind of individual totemism, peculiar to Central America, is nagualism (from the Aztec *nahualli*). According to this belief, the life and destiny of each man, starting from birth, are closely associated with those of an animal, with which the man finds himself in an alter-ego relationship and which constitutes his "double." Pre-Columbian stone statues, probably from the preclassic period of Middle American history and coming mainly from Nicaragua and southern Colombia, represent a man (or, less probably, a deity) seated or standing with a zoomorphic alter ego perched on his back or head (PL. 118). Nagualistic aspects also appear in various art forms of La Venta (Olmec culture), for example in representations of human figures, reclining but with the limbs often strangely contorted and wrapped in the hide of a beast. Nagualistic characteristics are also encountered in some representations of divinities of the Aztec pantheon, as well as in certain images of Quetzalcoatl. In the former, the god sometimes carries on his own head that of his double; or else the face of the god (in some cases, however, almost certainly that of a human being) is represented inside the wide-open fangs of a wild beast. In the latter, Quetzalcoatl's double — i.e., the feathered serpent — rears up behind the anthropomorphic image (e.g., in the stone sculpture from Tula and the frescoes of Chichén Itzá; see MIDDLE AMERICAN PROTOHISTORY). Reflections of a similar belief (but the sources are not explicit on this point and one should therefore consider this merely a hypothesis) may also exist in examples of pre-Columbian Peruvian art. On some vases in the Mochica style, for example, a feline muzzle is clearly visible on the forehead of the personage represented.

TOULOUSE-LAUTREC, HENRI DE. French painter (b. Albi, Nov. 24, 1864; d. Château de Malromé, Sept. 9, 1901). Henri Marie Raymond de Toulouse-Lautrec was a member of the aristocratic family of Toulouse-Lautrec Monfa, of ancient origin. After passing the early years of his life mainly at the Château du Bosc, one of the family estates near Albi, the young Henri was taken to Paris in 1872, where he attended the Lycée Fontanes (now Lycée Condorcet) for some time before being entrusted to private tutors. He was of frail constitution and delicate health, and when in 1878 he slipped on the floor of the family home in Albi, he broke his left femur. He went for treatment to Barèges and Amélie-les-Bains, but in 1879, at Barèges, he broke the other femur. The two fractures proved very serious, probably because of a congenital defect in the knitting of the bones, leaving Toulouse-Lautrec maimed for the rest of his life. His legs remained short and stumpy, while his torso developed normally. This handicap, however, as his letters and the recollections of those who knew him during that period attest, did not lead him to despair, even though he felt deeply his disabled condition, all the more because he belonged to a class for whom outdoor activities such as horseback riding were social obligations. It was probably because of his disability that his father, unlike his mother, took no interest in his life and career. But although in 1885 Toulouse-Lautrec left his family to live alone, returning home only periodically, it does not seem that the deformity, at least in its early stages, produced in him that inferiority complex which has sometimes been assumed as a basis for the interpretation of his work.

In any case, it was during his convalescence that Toulouse-Lautrec began to devote himself to painting, encouraged by his mother, who saw it as an activity able to distract her son's thoughts from his disablement. When his vocation as a painter manifested itself, Toulouse-Lautrec was already a cultured young man who had shown even while attending classes at the Lycée Fontanes that he could master the humanities. Painting now offered him a powerful means to express his intelligence in an environment — that of the French nobility in the second half of the 19th century — in which, as Lionello Venturi (1950) wrote, "he could not remain without feeling humiliated, all the more so because intelligence was not particularly valued in such circles." However, although Toulouse-Lautrec abandoned this environment and reacted against it at an early age, he never disavowed it. His later predilection for subjects of popular life, the theater, the circus, the fashionable cabarets (IV, PL. 281; VII, PL. 435), and the brothels does not mean that he did not retain a certain aristocratic approach that ennobled such subjects even while he raged against them. Thus the artist delineated his figures — in paintings, drawings, and lithographs, and even in posters — with an outline that lends them elegance and affirms the priority of style over veristic detail and over excessive idealization. It is just this synthesis of realism and idealism that distinguishes the art of Toulouse-Lautrec: a synthesis realized in the fluid line that unites the various planes

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

of the figures, in a manner later adopted by Modigliani (q.v.). For all its originality of presentation and of displacement of masses, this technique falls within the great tradition of French drawing — a tradition which, in the 19th century, descended from David to Ingres and Degas (qq.v.) and which found, in the work of Toulouse-Lautrec, one of its most distinguished expressions.

Although Toulouse-Lautrec was well acquainted with impressionism (q.v.), which was revealed to him above all through the paintings of Manet and Renoir (qq.v.), he was a long way from it in his work. However, he adapted its spirit of synthesis to his own ends, substituting for analytical rendering of details an immediate and concise expression that identified the faces and characters of his figures with a few effective strokes and free touches of color. Hence the climate created by impressionism was necessary to him, even though the chief influence on him was Degas, a painter who — precisely in his use of line — differed substantially from the other impressionist painters. Toulouse-Lautrec was thus in a position to reject all academic compromise, indeed, even to satirize a painting style like that of Puvis de Chavannes (q.v.), which, overcharged with literary symbolism, was outside the esthetics that had arisen from the impressionist revolution. It was Puvis de Chavannes' *Sacred Grove* (Lyons, Mus. B.A.) that Toulouse-Lautrec parodied in 1884 (New York, Coll. Mr. and Mrs. Henry Pearlman). Maurice Joyant, who was one of the artist's great friends, refers (1926–27, p. 50) to a letter in which Toulouse-Lautrec said: "I have tried to depict the true and not the ideal. It is a defect, perhaps, for warts do not find favor in my eyes, and I like to embellish them with playful fur, to round them, and to put a shining end on them. I do not know if you bridle your pen, but when my pencil moves, it is necessary to let it go, or — crash! . . . nothing more." To "depict the true," therefore, did not mean the pure and simple return to a realistic taste but rather the awareness of a reality that was not dissimilar from — in fact, was carried beyond — the reality postulated by the impressionists.

Toulouse-Lautrec's initial training as a painter took place under the supervision of a painter friend of the counts of Toulouse-Lautrec, René Princeteau, and the young Henri was also struck by the works of John Lewis Brown. These were, however, passing influences; in general, Toulouse-Lautrec preferred to work independently, even then displaying a preference for subjects drawn from the daily life under his eyes, as evidenced, for example, by the small canvas of 1881, representing his father, Alphonse de Toulouse-Lautrec, driving his mail coach to Nice (PL. 119). As in this instance, the aristocrat's passion for horses, as well as the influence of Princeteau, a painter of equestrian scenes, often determined the subjects of these early works, immediately before and after 1880 (e.g., the *Soldier Saddling His Horse*, 1879; the *Trotting Horseman*, 1879; the *Amazon*, 1880; the *White Horse Gazelle*, 1881; all, Albi, Mus. Toulouse-Lautrec). The artist was already showing himself well on the way to mastering his means and directing them toward a pictorial expression that presaged his later stylistic novelty and was far from the realistic approach of a Courbet (q.v.) or the romantic approach of a Delacroix (q.v.) to similar subjects. In some of his early paintings, Toulouse-Lautrec did not hesitate to use flamboyant and glaring colors, to lay them on in abruptly broken strokes, even to make them harsh and clashing in order to achieve atmospheric effects that, while they lack the transparency and the delicate gradations of impressionist painting of the period, are always vivid and dynamic. The special merit of these paintings derives from a certain ingenuousness or, better, an immediate, unfiltered contact with reality; but the audacity of the chromatic combinations is so deliberate as to exclude any suspicion that it masked an inability to realize his aims. Toulouse-Lautrec was already possessed of a special vision and was seeking the most suitable means of expressing it.

Since he intended to make painting his profession, Toulouse-Lautrec was aware of the necessity for systematic training. Toward the end of 1882 he entered the atelier of Léon Bonnat in Paris. This master rejected all innovation: he had been, and remained, one of the most determined adversaries of impressionism; he permitted his pupils no freedom whatever and left no possibility for personal interpretation. To him, Toulouse-Lautrec's drawing was "atrocious," and the latter moved on, in 1883, to the atelier of Fernand Cormon — an equally academic painter who was, however, more disposed to understand, if not to justify, innovations. During these years of the definitive development of Toulouse-Lautrec's style, Paris saw the emergence of new movements in art that consciously went beyond impressionism: pointillism, symbolism, the painting of Gauguin (q.v.). In Cormon's studio Toulouse-Lautrec had the opportunity to meet many artists, among them Emile Bernard and, in 1886, Van Gogh (q.v.), who had just arrived in Paris. During the same period, too, the fashion for Japanese prints was spreading — a taste that coincided with the characteristic development of line in Toulouse-Lautrec's drawing. It was Degas, as already mentioned, who impressed him deeply at this time, sometimes even in his choice of the same subjects; but Gauguin too, though so different in temperament, contributed something to his formation. Yet it was Toulouse-Lautrec's own temperament that, "much more concentrated and less extensive than Gauguin's, quickly transformed all he had learned into an absolutely personal style. Already around 1890 his style was definitively shaped" (Venturi, 1950).

In the years immediately preceding 1890, Toulouse-Lautrec focused his interest increasingly on that world which, until the not-too-distant end of his life, was the environment in which he felt most at home: the world of the circus, the theater, the cabarets, the world of Montmartre, which was beginning to acquire the atmosphere that was to make it famous as the typical expression of *la belle époque*. Toulouse-Lautrec met Aristide Bruant, a writer of songs and owner of cabarets such as the Mirliton; and under Bruant's influence he made drawings illustrating these songs, which were published in various journals, among them Bruant's *Mirliton*, named for his cabaret. In 1888 he could paint a canvas like the *Equestrienne of the Fernando Circus* (Chicago, Art Inst.), in which the color, no longer placed naturalistically, became autonomous in order to underline the linear dynamics governing the entire composition. In 1890 began the Moulin Rouge cabaret scenes (VII, PL. 435), in which were to appear the figures that Toulouse-Lautrec immortalized in paintings and drawings: La Goulue (PL. 119), Valentin le Désossé, Jane Avril (PL. 121). In 1891 the artist created the first poster for the Moulin Rouge (PL. 120), a work of extraordinary effectiveness: in the center the light-colored figure of La Goulue dancing; in the foreground, establishing an area of contrast, the darker figure of Valentin le Désossé; in the background the black silhouettes of the patrons. The compact arrangement and the linear movement are perfectly suited to the decorative requirements of the poster, which replaced that of Jules Chéret on the walls of Paris. Toulouse-Lautrec, from this beginning, revolutionized the art of the poster (cf. XI, PLS. 380, 383), synthesized it, and gave it an autonomy of expression hitherto unknown.

Toulouse-Lautrec had tried his hand at lithography for the first time in 1885 to illustrate a song by Bruant, "À Saint-Lazare" (Paris, Bib. Nat.); he returned to this medium in 1892, to stay with it until his death. His enormous production, mostly of subjects from the world of cabarets and theaters, demonstrates a skillful and meticulous technique. The stroke became ever more summary, the planes more unified. Toulouse-Lautrec ennobled the medium and raised it to the level of art. In addition to many lithograph posters and individual plates, he produced numerous imposing lithograph series: 11 of his lithographs, together with another 11 by Henri Gabriel Ibels, appeared in 1893 in the album *Le Café Concert*, with text by Georges Montorgueil; 16 lithographs devoted to the singer Yvette Guilbert were printed in 1894 with text by Gustave Geffroy, and another 13 portraits of actors and actresses in 1895; 11 appeared in 1896, in the women's journal *Elle*; more of Yvette Guilbert were printed in London in 1898; and 22 of his plates illustrated *Les Histoires naturelles* of Jules Renard, published in 1899 (this project had first been proposed to Renard by Toulouse-Lautrec in 1895).

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

The world whose spirit Toulouse-Lautrec captured so vividly included also the brothels, from which he began to draw subjects in 1892, the best-known undoubtedly being his painting *Au Salon de la rue des Moulins* (1894; PL. 123); the Musée Toulouse-Lautrec in Albi also has a pastel of the same subject.

The question arises how far Toulouse-Lautrec's painting influenced his lithographic work and vice versa. His lithography certainly drew greater authority from his painting; on the other hand, the fluidity and smoothness of the lithographic medium contributed to the dynamism and descriptive power of his paintings. The same subjects recur in both media — Jane Avril, Yvette Guilbert, the patrons of the theaters and cabarets — but the color treatment is subtly different. It is, of course, more elaborate in the paintings, and the colors are more luminous and, so to speak, surer, because here the artist did not have to allow for variations in printing and inks. It is this very ability to grasp the subtle differences of two techniques and to adapt the same vision to two different means of expression which demonstrates Toulouse-Lautrec's genius and power.

The last years of his short life were his most prolific and produced masterpieces in both painting and lithography. To these years belong, in addition to many lithographs and posters, paintings such as *The Bed* (1894; PL. 122) — a stupendous achievement of color and line, done for a brothel, *La danse de la Goulue* (1895; PL. 119), and *La Clownesse Cha-U-Kao* (1895; Winterthur, Switzerland, Reinhart Coll.), as well as portraits of various other people, including the cabaret singer May Belfort (1895; Cleve. Mus. of Art), Loïe Fuller of the Folies-Bergères (1893), Dr. Gabriel Tapié de Céleyran (the artist's cousin and companion in his night life; 1894), and the actress Marcelle Lender (1895; last three, Albi, Mus. Toulouse-Lautrec). Toulouse-Lautrec analyzed this world of his pitilessly but without false moralizing and, above all, without self-righteousness.

Toulouse-Lautrec did not hold himself aloof from the artistic life of his day: in 1888 he exhibited a painting in the Salon des Indépendants and in 1893 he exhibited at the Goupil Gallery. In 1894 he was in Brussels, and again in 1896, when he participated in the first exhibition of "The Free Esthetics." In the same year he went to Spain and Portugal, and in 1898 to London. But in the following year, his health by then completely ruined by excessive drinking, he was placed in a nursing home in Neuilly-sur-Seine, on the outskirts of Paris. Even there he did not cease working but drew from memory his favorite circus scenes. When he was discharged — thanks largely to the published appeals of some of his friends — he went to Le Crotoy and then to Le Havre, where he embarked for Bordeaux in order to settle in the nearby town of Taussat-les-Bains. He was still painting masterpieces, such as *The English Girl of the "Star" at Le Havre* (1899; PL. 124). At the end of 1899 he returned to Paris, where he stayed until May, 1900, then went back to Le Crotoy, Le Havre, and Bordeaux and on to nearby Arcachon. In September he went to stay with his mother in the Château de Malromé, but between April and June of 1901 he was again in Paris. It was at Malromé that he died, on Sept. 9, barely thirty-seven years old.

The legends that have been woven around the life of Toulouse-Lautrec cannot obscure the concrete reality of his work: he was an innovator and the creator of new expressive elements that were to be appreciated and developed by other great painters, among them — to name but one — Picasso.

TOWN PLANNING. Town planning is the science that studies all aspects of the urban phenomena. Its purpose is to plan the historical development of these phenomena through the interpretation, reordering, rehabilitation, and functional adaptation of existing urban aggregates; through control of the growth of urban aggregates; through the designing of new aggregates; and through the reform and organization *ex novo* of the relationships of aggregates to one another and to the natural environment.

Town planning is concerned with all the geographic, historical, ideological, cultural, and economic components of urban living, as well as with the associated aspects of technology, hygiene, education, and public assistance. Esthetically the field is related to designing (q.v.) and architecture (q.v.; see also MONUMENTS; STRUCTURAL TYPES AND METHODS).

As an autonomous discipline town planning developed in the 19th century in response to problems intensified by progressive industrialization and the rapid increase in population and traffic.

SUMMARY. The concept of the city (col. 172). Nomenclature (col. 175). Definition of town planning (col. 177). Definition of the city (col. 180): *A geographic versus town-planning definition of the city; Historical-sociological definitions of the city.* Urban space (col. 186): *The archaic world; Ancient urban civilizations; The medieval city; The Renaissance city; The baroque city; Disintegration of urban space; Rediscovery, analysis, and reconstruction of urban space.* Modern utopias (col. 216). Urban planning (col. 224): *The rationalist experiment and the plan of Amsterdam; A new conception; From technical town planning to continuous creative planning, Juridical and economic aspects.* Problems and prospects (col. 235). *Basic data for a town-planning accountancy. Specific problems: a. Residential districts; b. Central-city areas and urban renewal; c. Vehicular traffic; d. Equipped industrial zones; e. Public recreation facilities; Plans for the future.*

THE CONCEPT OF THE CITY. Any study of the urban phenomena, regardless of time or place, must not only take cognizance of the city's activity and unordered expansion but also view the city as an inseparable and active participant in the larger civilization. Evaluation of these observations, along with any preliminary interpretation of the nature of urban dynamics or prediction of future urban structure, leads to a broadening of the horizon of exploration; but it soon becomes

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

apparent that our instruments of knowledge are woefully inadequate. Only in recent times have the complex functions of human settlements in an area and, in fact, the idea of the city itself become at all clear. Preceding this, mankind experienced some five thousand years of urban civilization (and before that, village culture), during which time populations became concentrated in large groups and cities continually formed, flourished, expanded, were transplanted or declined, and were born again — in some cases, repeatedly on the same site. As Patrick Geddes pointed out, villages, cities, or regions are not only "places in space" but "dramas in time" and are therefore part of a dynamic process of development.

In the ancient world the concept of the city, from the palace complex to the polis, was essentially static and spatially delimited. This is apparent from descriptions by historians, geographers, and travelers and from city regulations, from archaeological evidence, and even from the Platonic and Aristotelian hypotheses concerning ideal organization and political rule. All the evidence, despite its great variety, indicates that economic and social stability was desired both in the main urban complex (citadel, sacred center, capital, or commercial center) and in its agricultural area.

Roman territorial organization was composed of successive aggregations of similarly planned areas, each with a central city, economic zones, urban and territorial infrastructures, and civic institutions. The whole was characterized by constant, monotonous, and universal precepts that succeeded for a brief period which was nonetheless decisive for urban history. The economic and social equilibrium of the basic territorial units integrated within the central political system was guaranteed over an extensive area (save for exceptional cases, such as the maritime republics).

The idea of the static microcosm is even more evident in the organization of the medieval walled city, which with the surrounding countryside formed a closed and self-sufficient economic system. Here the statutes, institutions, dialects, and architecture, together with the reemergent local pre-Roman cultures, showed respect for the universally accepted principles of internal economic and social equilibrium and of the equality in rights of settlements recognized by statute.

Between the 16th and 18th centuries seigneuries and principalities not only confirmed the idea of the centralizing urban microcosm but also isolated it with an increasingly complex and permanent defensive system. These units further accentuated the hierarchization of the urban centers over the territories. During these centuries there was a development of civic art, which architecturally enriched cities that were princely seats. At the same time there arose theoretical discussion concerning the *forma urbis*, ultimately creating a flowering of new ideas on urban planning that suggested, under the guise of "ideal cities," a number of possible universal alternatives to existing schemes. Very often the longed-for innovations were merely formal, geometric, and defensive; but in the course of this inventive search there emerged new ideas in the technical field and in the area of social ordering that opened the way to various types of utopias. The idea of the city was finally set in motion, as confirmed by Leonardo's plans for the irrigation of the Val di Chiana, so as to provide a water and sewage system for a spindle-shaped multilevel city, and his scheme for the reorganization of Milan into 10 cities of 30,000 inhabitants each.

The baroque and neoclassic orders, which were congenial to a political despotism that widely exploited civic art, did not encourage this fermentation; nor did *laissez faire* as it applied to cities. Only with the utopias of the first 19th-century social reformers was the concept of the "ideal city" revitalized. Meanwhile the urban horizon was rapidly widening as the result of Protestantism, mercantilism, capitalism, colonialism, political strife, various scientific discoveries, industrial and demographic revolution, centralization of power, and new economic theories. The closed circuits of the medieval economy and static demographic groupings were being destroyed, while new ideas were contributing to the destruction of the old urban order and the static territorial hierarchy.

After centuries of relative demographic stability, Europe entered a new phase of population increase, expanding from 180 million in 1800 to 400 million in 1900. The population redistributed itself across the continent and created problems for which the old urban and territorial structures were unprepared. For a time no new town-planning idea replaced the abandoned archaic monocentric system. Toward the middle of the 19th century the chaotic urban and territorial structures were attacked by the new forces; they adapted or were left to stagnate, or they were physically destroyed (e.g., demolition of old walls). Establishments for production and other purposes arose without recourse to civic art, and new technical infrastructures were indifferently superimposed upon the obsolete ones.

The sensation of infinitely expanding possibilities was expressed by Saint-Simon (1825): "Now that the dimension of our planet is known, let the savants, artists, and industrialists make a general plan of execution to render the territorial possessions of the human species as productive and habitable as possible in every respect." At the same time the problems that arose and remained unsolved for lack of a wider vision amplified and grew more complicated. It was difficult to find a way to overcome the prevailing degeneration of traditional civic art, which was reduced to the academic design of tangential aspects of planning and to superficial approaches to demolition operations or urban renewal for the accomodation of vast speculative building operations. This state of affairs reached its climax in the 1850s with the Haussmann plan for Paris, which realized such municipal improvements as water and sewage systems, wide boulevards, and landscape gardening.

Two diametrically opposed approaches were followed throughout the 19th century: (1) that of utopian reformers in search of ideal models; and (2) that of urban engineers who had rediscovered the value of the over-all plan by widening their field of action from bridges and roads to include sanitation systems and mass transport. The first approach produced a few isolated prototypes and model workmen's districts built by enlightened industrialists in the wake of the 18th-century Nordic tradition; but this approach, with its abstract models, could not redirect a rapidly evolving society and its negative urban manifestations. The second approach produced engineering works such as the metropolitan underground and overhead railroad systems of London, Paris, and Berlin and several large-scale projects such as the layout of the Ring in Vienna (1856) and Ildefonso Cerdá's plan for Barcelona (1859); nevertheless, this second way proved unequal to the task.

In deference to private interests and laissez-faire principles, technical plans for the layout and extension of the rapidly expanding complexes were conceived and executed merely in terms of street layouts and building limits. The plans discriminated between the increasingly limited public land — by then reduced to roads and parks — and the increasingly extensive domain of private property, thus eluding the economic and social problems and the general comprehensive vision of the entire urban system. An approach to an integrated solution — social as well as technical, practical, and idealist — occurred toward the end of the 19th century as the result of various observations contributed by hygienists, geographers, sociologists, and demographers; and from the encounter of these new disciplines with urban engineering and a renewed, antiacademic civic art the specific, autonomous discipline of town planning was born. The technical, esthetic, and sociological foundations of town planning were established by Josef Stübben's *Der Städtebau*, (1890); Camillo Sitte's *Der Städtebau nach seinen künstlerischen Grundsätzen* (1889); Ebenezer Howard's *Tomorrow* (1898); Patrick Geddes's *Regional Survey* (1899); and Tony Garnier's *Une cité industrielle* (projected 1901–04; pub. 1917). From these foundations, and from the theoretical and experimental studies they stimulated in the following decades, there arose a new and more composite idea of the city and urban areas that was no longer associated with abstract and static forms but tended toward a synthesis of complex and heterogeneous factors. The urban phenomenon was scientifically analyzed and reconstructed. Even the ordinary man became aware of the significance, dynamics, and special problems of urban living.

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

The science of town planning has progressed, and the isolated residential groupings that supplanted the civic art and engineering feats of the first few decades of the 20th century have given way to a truly rational system that appears to be all-inclusive, continuous, and irreversible. The objective of the present treatment is to illustrate the theoretical and practical directions of this science, which is still in a phase of development and regularization, and to present its most significant concrete applications.

NOMENCLATURE. During the last decades of the 19th century, with the transition from civic art (until then conceived as architecture on a large scale) to the rising technology of the urban complex, the terminology of town planning changed and was rapidly enriched. Where, how, and why these terms emerged is a philological problem that has yet to be investigated; however, certain data are fairly reliable. In 1855 the word *démographie* appeared in a statistical treatise by A. Guillard (*Eléments de statistique humaine; ou, Démographie comparée*, Paris, 1855). In the study of the components of demographic phenomena (birth rate, mortality, emigration, immigration), the French statisticians used the term *urbanisation* (Am. usage, urban growth; Br. usage, urbanisation) to designate that particular type of immigration which at the time was causing urban centers to grow more rapidly than the surrounding demographic nuclei. Ildefonso Cerdá was the first to use statistical analysis systematically in the preparatory studies for his Barcelona plan. He prefaced the published illustration of his plan with an essay entitled *Teoría general de la urbanización* (1867), in which the term *urbanización* signified both concentration of the urban population and physical expansion of the city. This dual meaning presently exists in Spanish and French. In English the two meanings are expressed with two distinct terms: "urban growth" and "city development." The former refers to demographic-social phenomena, and the latter is used in the broad sense of evolution. The technical and legal meaning of "development" (since 1947) also includes the transformation from agricultural to urban land-use through the projection and carrying out of works, buildings, services, and installations, though the term is used in a less narrow sense to mean simple transformations in the use of real estate.

In German these particular terminology problems do not arise. The term *Städtebau* covers all operations pertaining to urban planning and construction and thus takes on the general meaning of "town planning." A worker in this field is called a *Städtebauer*. The use of this word dates back to the last decades of the 19th century and since then has remained unaltered; more recently new terms have been added in the field. Thus *Forschung*, the analytic and scientific phase of study, is now designated as *Stadtforschung* for cities and *Raumforschung* for territories. Territorial organization, which cannot be included in the concept of *bauen* ("building"), is termed *Raumordnung*. In the context of territorial planning the word *Planung* (e.g., *Landesplanung, regionale Planung*) has gained wider currency. In economic studies the term *Raumwirtschaft* ("spatial economy") has been introduced, and the political aspect of urban planning is called *Raumpolitik*.

The Anglo-Saxon linguistic arsenal is more complex, varied, and full of nuances owing to the contemporary use of three different matrices: "urban," "city," and "town." Thus in England the verb "to urbanise" indicates the act of making a site urban through physical transformation; this process is termed "development," while the substantive "urbanisation," as has been noted, is used exclusively in the statistical sense of population distribution; in America "urbanization" signifies only the extension of urban construction. Less frequently used is the word "urbanism," which indicates a way of life. The term "town planning" took precedence over "city design" in England at the beginning of the 20th century. This usage was established by the Town Planning Act of 1909, the first English town-planning law; by the title of the first specialized magazine on the subject, *Town Planning Review*, which appeared in Liverpool in 1910; and by the Town Planning Conference, held in London in 1910.

In 1909 the first national congress on this subject in the United States was held in Washington, D.C., under the denomination "city planning," which has remained the preferred term in the United States. Town planning or city planning do not, however, comprise the entire field, which was soon extended to include territories and regions. Thus in England the term "town and country planning" has gained currency. In this usage "country" denotes territories and smaller units. The expression "regional planning" is also used in Great Britain. These terms came into current use after 1945. In the United States the terms "city and regional planning" and "urban planning" have emerged. According to Frederick Adams, the former emphasizes the technical and operative aspects of planning at the territorial level, while the latter clarifies the interrelationships between the social, economic, and physical aspects of planning.

In the university teaching of town planning, which began at Liverpool in 1919 and at Harvard in 1923, the names of the faculties vary. In England the general denominations "town planning" and "town and country planning" prevail, though "civic design," the old name for town planning, has been retained at Liverpool University and was adopted by London University in 1947. In the United States the prevalent denominations in universities are "city planning" and "city and regional planning."

The French vocabulary in this field is smaller than the Anglo-Saxon but not so schematic as the German: The first derivations from *urbain* were *art urbain* and *urbanisation*, with its opposite, *désurbanisation* ("urban decentralization"). In 1903 historical studies and courses in urban history (*études urbaines*) were instituted by Marcel Poëte. First applied to Paris, these studies were later extended to cities in general. *Urbanisme*, conceived as the science of the evolution of cities, began from these *études* and from the outburst of English activity in this field in the first decade of the century. In 1911 the Société Française des Urbanistes was founded. Intense activity in the second and third decades of the century produced numerous French publications on town planning and led to the translation of German and English classics in the field — from Sitte (1889) to Unwin (1909). Consequently, the word *urbanisme*, which continued to be used in historical studies and forecasts, often yielded in that period to *science des plans des villes*, which corresponds more closely to the term "town planning." After the 1930s this usage disappeared, and the word *urbanisme* came to sum up the broadest historical, theoretical, and practical meanings of town planning.

From the first years of the century other new terms appeared in the nomenclature. The *plan d'aménagement*, or general plan, was later supplanted by the *plan directeur*, or master plan (1952). *Aménagement* was retained only in the denomination *aménagement des territoires* (1949) and the two specific subdivisions: *aménagement regional* and *aménagement du territoire* (i.e., of the entire national territory). In 1960, after the introduction of the national economic plans spanning a period of several years, *aménagement des territoires* was replaced by *planification territoriale* for consistency with the usage *planification économique*. In the scientific field there has been some attempt to incorporate *urbanisme* within the more extensive sphere of the organization of land areas, for which Rouge (1947) proposed the word *géonomie* as an equivalent of *Raumordnung*.

The Italian planners made some initial endeavors at town planning in the 1920s, with the statistical-demographic studies that constituted the scientific basis of this field as their sole equipment (G. Mortare, *La popolazione delle grandi città italiane*, Turin, 1908). The first Italian congress was held in 1926 at Turin under the denomination *Urbanesimo*, this term being used both in its demographic sense and as an adaptation of *urbanisme*. In 1927 *urbanesimo* was again employed in this sense in a publication on Turin by Armando Melis. In the last pages, however, there appeared the terms *urbanistica* for town planning (both as an adjective and as a substantive) and *urbanista* for town planner. The 12th Congress of the International Federation for Housing and Town Planning (Rome, 1929) contributed to freeing Italian cultural circles of their provincialism in this field. As a result of this congress the Isti-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

tuto Nazionale di Urbanistica was formed (1931) and publication of the periodical *Urbanistica* began (1932).

Italy's backward position was in marked contrast with the surge of legislative activity in this field during the early years of national unity, producing in 1865, in advance of France and England, a law sanctioning the condemnation of property for public purposes. Through this law there had been instituted, although in an optional form, master building plans and plans of extension that were characterized by a broad vision of the urban phenomenon. Not until the post-World War II period, however, did there develop in Italy a town-planning concept that was directed toward transforming fragmentary projects into a continual planning process.

Definition of town planning. More than a hundred years have been necessary to liberate the concept of town planning from its identification first with civic art and then with various building codes and road engineering, to the point that town planning has become an autonomous discipline with a specific objective and methodology. It is therefore understandable that definitions formulated over this long period are widely divergent. At the same time, the uncritical attitude of many experienced planners toward terminology has definitively impeded scientific clarification and effective intervention. The definition of the art and technique of the building of cities, long accepted as a simple paraphrase of *Städtebau*, appeared to parallel the academic definition of the art and technique of the construction of edifices; it thus betrayed a conceptual position that regarded town planning as fundamentally corresponding to architecture itself except for differences in scale. This meant a return to the then-outdated definition of town planning as "civic art." At the same time, such a definition, by assigning to town planning a hybrid character of art and technique, initiated a long series of ambiguities and disputes on the priority of art versus technique and the means of reconciling one to the other.

For Stübben (1890) the purpose of town planning was to clothe the technical necessities in pleasing forms, as though it were little more than a matter of theatrical decoration. This definition harked back to the followers of the architectural academy and proposed a distinction between form and structure, between the functional plan and the artistic aspects of a building, and consequently between urban design and the architectural decorum of the various edifices.

Even the *Larousse du XXème siècle* (1933) defined town planning as the *aménagement et embellissement* of cities and villages and suggested that its program should be condensed into three words: *assainir*, *agrandir*, and *embellir* — a synthesis of hygiene, comfort, and esthetics, which was a new version of the Vitruvian triad. P. Remaury, in one of the early numbers of the periodical *Urbanisme* (1934), maintained that town planning "coincides with architecture, of which it is nothing but an extension based upon a master plan." Such assertions reappear from time to time, especially among those critics who consider only the spatial and formal aspect of the urban body, defined architecturally, to be the characterizing element of town planning (e.g., G. C. Argan, "Urbanistica e architettura," *Le Arti*, 4, 1938, pp. 365–73).

A different point of view was held by those who did not stray fundamentally from the traditional definition but considered the characterizing element of town planning to be the "project," or detailed segment of the over-all plan. The field thus became the art of designing city plans (Unwin, 1909, see the chapter entitled "Art of Designing Cities"; Rey, Pidoux, and Barde, 1928). Through study of the projected plan of the entire city, an over-all vision was attained, even though it was geometrically represented and thus two-dimensional and statically defined, with all the implied limitations. This vision, however, represented a first step away from the identification of town planning with architecture and from the naïve union of art and technique.

The study of city plans can lead — as it has in fact — to an overestimation of the geometric aspect of the plan itself and to a stress on morphological characterizations. The scientific output of Lavedan, from his *Histoire de l'urbanisme* (1926) to his *Géographie des villes* (1936), shows traces of this emphasis; but it is also immediately apparent that planimetric representation is merely a symbolic instrument for condensing the solutions to many problems and for expressing the character of the city. It is precisely in the search for scientific and practical definitions of the "problems" and the "city" that the concept of town planning becomes more precise.

Le Corbusier (1927) presented his scheme for an ideal modern city with the following statement: "Urbi et orbi, within and without the city, this is the time-worn phrase which indicates the immense power of the city, that without the city there is nothing. In fact town planning is the expression and the result of that social contract by means of which the collective existence of mankind has been made possible." The universal vision of the new city as it springs from the creative impetus presupposes and anticipates for Le Corbusier a new but not well-defined social structure, based on a fresh "pact of association." During those very years Max Weber was studying the *conjuratio* (1962) as the sociological foundation of the formation of the Western city about the year 1000.

A definition of town planning cannot consider only the most propitious and exciting case of the *ex novo* creation of a city, especially a large one; it must also consider the more complex case of operations in existing cities, including all possible transformations, from the creation to the expansion and modification of any single feature. As early as 1920 this formula was expressed in very general terms by G. B. Ford: "Town planning is the science and art of applying practical foresight to the elaboration and control of everything that enters into the material organization of a human agglomeration, as well as everything that surrounds it." Ford later predicted that the work of analysis and synthesis should result from the combined efforts of competent specialists. With a broadness of outlook he affirmed that town planning's field of action is unlimited and includes not only villages and cities but also the surrounding territory, regions, and the entire nation. This completely new concept guided practical activity but had no immediate theoretical repercussions. During the 1930s the attention of planner-theorists was occupied mainly by the experimentalism of the rationalist period and was limited to the field of habitation (from house to neighborhood). The modest but serious preparation of the first scientifically studied plans received only scant attention in those years. Nevertheless, these plans offered the first real opportunity to encompass the complex urban reality through systematic analysis and the application of statistical methods. The most exemplary work, for its methodology and results, was the study of the plan of Amsterdam, which lasted from 1928 to 1935. It can be said that the new town planning of the 20th century is founded upon this experiment.

In this light the definitions of town planning provided in those years appear extremely weak and imprecise. A. Agache (*La rémodelation d'une capitale: aménagement, extension, embellissement*, Paris, 1932) defined it as the science of observation, the art of composition, and social philosophy; but he then went on to explain that the planner must translate into proportions, volumes, perspectives, and profiles the various proposals presented by engineers, economists, sanitary experts, and financiers — thus reducing town planning to an interpretation and simultaneous translation of other people's ideas, with an obvious denial of any autonomy in method and judgment. The ambiguity of the planner-interpreter was to last a long time and gave town planning the form of a neutral and passive technique subject to other disciplines.

Against this attitude as well as its opposite — the utopian town planning proposed by the social planner-reformer — another position was taken. In view of the complexity of the problems posed by urban centers and the scope of analyses required, town planning was defined as the point of convergence of diverse arts and sciences and as a science which embraces manifold branches. Insufficient as these definitions may be, they deal with the focal point of town planning rather than with peripheral aspects. It should therefore be possible to pinpoint a specific principle of internal cohesion for town planning

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

and to establish a scale of values that could serve as a guide in the making of relevant choices. Several solutions to this problem have been suggested.

The rationalist architects and planners of the 1930s perceived the principle of internal cohesion in the functionalism of all the elements constituting a city. Bottoni (1938) defined town planning as "the doctrine which is concerned with the organization of the sites or centers intended for habitation, production, distribution, collective life, and recreation and repose, with the appropriate means of communications and transport, in the manner most in conformity with their intrinsic function and higher social necessities." Bottoni does not specify the principle governing the functionality of the individual parts, nor does he deal with the transition from the functionality of the parts to the functionality of the whole. This concern with function, which is not new in architectural theory, is linked in town planning with the penetrating thought of Ildefonso Cerdà, who sought the principle of internal cohesion of the urban structure in the "reciprocal relationships between content and container, which are an expression of the functioning of the population within the city." According to the rationalist planners, however, the principle of functionality was seen to descend essentially from intrinsic relationships between physical objects (e.g., exposure to the sun and the distances between buildings); whereas for Cerdà the basis for comparison and measurement was the population in its relationship with the physical urban structure, so that city and population were two factors that should be constantly examined in view of the reciprocity of their relationships. Thus the way was opened for the more general and organic vision that was amply developed by Patrick Geddes in his studies on the evolution of the city. For Geddes (1915) planning was primarily a civic science based on the "civic survey," and its aim was to reorganize cities and regions.

The idea of the city as an organism that lives its own life had been asserted by Marcel Poëte in 1908. The organic conception, which developed the ideas of Cerdá, Geddes, and Poëte, was clearly defined in 1937 by Luigi Piccinato (*EI*, XXXIV): "Town planning in general examines the evolution of the city in its totality, for the city may be considered a living being in continual transformation." Set in this perspective framework, town planning has in view the general study of the conditions and necessities of life and the development of the cities. Although the organic principle surpasses the technological position of the functionalist, it still appears inadequate to solve all the problems posed by urban planning, particularly in the economic area. Nor does it precisely establish a criterion by which choices can reasonably be made. The problem becomes even more complicated considering the social and political structure of urban life.

In 1941 C. L. Racchianti warned that to speak of town planning divorced from a given ethical-political conception makes no sense, since town planning is not merely a technique. The question arises whether it is still possible to discover a principle of cohesion, unification, and guidance in such an expanded horizon. William Holford, in the *Town and Country Planning Textbook* (1950), perceives such a principle in the coordination and combination of operations on various fronts, a process which he claims is common to the three fundamental phases of planning: survey, plan of development, and program of realization. The *Textbook* illustrates practically what town planning can derive from analyses by the various disciplines of geography, sociology, economics, and law, and what specific technical equipment it possesses after several decades of experimental activity. The process of synthesis that is indispensable to the formation of the plan has been clearly defined by Keeble (1952) as the result of collecting, comparing, and evaluating all the correlations, possibilities, and conflicts disclosed by research. Thus the principle of cohesion in the different phases of analysis and synthesis is primarily a principle of method. While analysis can be carried out scientifically, synthesis still remains subjective, according to Keeble's study.

The search for the scientific objectification of an ever-greater number of choices and the *ex ante* experimentation with the results of synthesis constitute the methodological themes of the 1960s. Although the practical results in this direction have been scant, it is nevertheless significant that the problem is now conceptually stated and constitutes the field of exploration of most advanced work in the scientific study of urban planning.

Definition of the city. The enormous literature on the definition of the city that has accumulated in little more than half a century has been the work of geographers, historians, and sociologists. Even more abundant is the production of local monographs compiled as the premises of city plans; but only a small percentage of these has been printed, and the majority, distributed in a limited number of copies, has unfortunately been lost. An up-to-date and systematic bibliography of these monographs classified by country is lacking, though some attempts are being made in England, France, and Poland. Particularly lacking in this field is an international center of documentation that would guarantee the preservation of the enormous quantitites of material produced for reference purposes.

As has been noted, interest in the geographical and sociological study of cities began during the last decade of the 19th century. This was remarkably late in view of the concern with town planning manifested in the United States and Europe from the middle of that century. In *Die Lage der Arbeitenden Klassen in England* (1845) Friedrich Engels had dramatically denounced the living conditions of the working class in England with a detailed description of Manchester. Despite conflicting points of view, some common principles were recognized and came to constitute the conceptual frame of reference for specific research in the field of town planning. Friedrich Ratzel (1844–1904), a pioneer in the field of anthropogeography, explained the principle of evironmental unity and consequently the connection between all phenomena of physical and human geography. The biologist-philosopher Ernst Haeckel (1834–1919) inaugurated the science of ecology with his investigations into the mutual relationships of organisms living in the same place and their adaptation to the environment. Both opened the way for the teaching of Vidal de la Blache (1845–1918) and his *Géographie humaine* (Paris, 1922). In these studies are recognized the origins of the modern schools of urban geography, which include scholars of the stature of Max Sorre, Pierre George, and B. G. Chabot.

Modern sociology developed in this same period, originating with Emile Durkheim's first work, *De la division du travail social* (1893). Starting with the distinction between the division of technical labor and the division of social labor, Durkheim demonstrates that the development of the latter leads to the predominance of "organic solidarity" (through dissimilarity) over "mechanical solidarity" (through similarity). This predominance is manifested in the multiplication of particular groups, in the progressive limitation of "repressive" authority, and in the interiorization of the collective conscience and the "fortification" of the human personality. According to Georges Gurvitch, Durkheim affirmed "the specificity of the social reality and its irreducibility in the face of any other reality." The Durkheim school, continued by Marcel Mauss and Maurice Halbwachs (1938), is currently represented by the work of Gurvitch. The object and method of sociology in Durkheim's system of thought are defined by Gurvitch: "Sociology is a science which studies, from a broad outlook and in a typological and explicative manner, the different degrees of crystallization in social life, the basis of which is to be found in the conditions of collective conscience, which are opaque and irreducible to individual consciences; these conditions reveal themselves in externally observable constructions, institutions, pressures, and symbols; they materialize in the transfiguration of the geographic-demographic surface and at the same time impregnate these elements with the ideas, values, and ideals toward which the collective conscience tends in its aspect of a free current of thought and aspiration." In his *Traité de sociologie* (Paris, 1958) Gurvitch defines sociology as "the science which studies, as a whole and on various levels, the total social phenomena . . . with the aim of following up and explaining, in close connection with history, movements of structuration, destructuration, restructuration, and liberation." According to this sociological

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

trend, the first step in the study of a total social phenomenon arises from the recognition of the morphological and ecological surface through examination of the material exteriorizations of the social reality (density, movement, and spatial distribution of population in urban complexes, means of communication, utensils, etc.), which are considered social in that they are continually penetrated and transformed by collective human action.

Within this framework lies the research in urban sociology of Chevalier (1950) and Chombart de Lauwe (1952). This research is linked in turn with the studies in urban ecology of the North American school, which were begun in 1919 by Robert Ezra Park, developed in collaboration with E. W. Burgess and R. D. McKenzie (*The City*, Chicago, 1925), and continued by the Chicago school. The common aim of the studies in urban sociology and ecology has been defined by Szabo (1953) as "the study of social groups and their interaction insofar as they are influenced by that physical-psycho-socio-cultural environment represented by an urban agglomeration."

Toward the end of the 19th century there occurred a substantial renewal of older disciplines, such as economics and statistics, and the modern era of statistical studies began with the work of the English scientist Karl Pearson, from whom the modern schools originated. In economics a decisive development was initiated in the last decades of the century through the work of two schools, both abstract: the Austrian school of marginal utility applied to the field of microeconomics; and the Lausanne school of general equilibrium, later extended to an abstract macroeconomics by the economic school of Stockholm and by the London school of Alfred Marshall. The Marshall school set forth the theory of partial equilibrium based on the temporal analysis of long and short periods. Subsequent developments took into account John Maynard Keynes's *General Theory of Employment, Interest and Money* (New York, 1936) as an attempt to formulate a central analytic theory relating to the working of fluctuations in all sectors of the economy. In more recent years an effort has been made to direct the various modern schools of economic thought toward a new methodology based on a unification of economic theories and statistical and mathematical methods. This methodology has opened up a new field of observation and conjecture. Econometric research, theoretical models and their application to the real world, over-all schemes for national budgets, and the use of models for prediction and decision-making are the principal features of this new economic science, which leads to the theory of planning conceived, according to the definition of G. G. Granger (*Méthodologie économique*, Paris, 1955), as the "organization or reorganization, in a systematic manner, of a structure and its way of functioning."

In the present context, reference to the economic sciences may seem at first glance to lack practical relevance; however, in the latest phases of the evolution of economic thought, instruments of observation and prediction for an over-all economy, defined territorially, have been applied to regions, urban agglomerations, and cities. Coordination and integration of those aspects of geography, sociology, and economics which concern the urban phenomena into a single coherent urban science has not yet been fully accomplished on the theoretical and methodological level, although attempts are being made, as yet in a crudely experimental form, in the more advanced studies on town planning.

A geographic versus town-planning definition of the city. A rapid review of the principle definitions of the city provided by modern geographers, historians, and sociologists reveals a great variety of emphases and viewpoints and suggests the difficulty of containing them within a single universally valid proposition. For example, the city as "a stable concentration of men and residences covering a considerable surface of land and including commercial streets in the center" (F. Ratzel, *Anthropogeographie*, Stuttgart, 1891) describes the preindustrial city and cannot therefore be considered sufficiently comprehensive or generally valid. To define the city, as opposed to the village, by the activity of its inhabitants is fruitless. The city as a concentration of nonagricultural activities (F. von Richthofen, *Vorlesungen über allgemeine Siedlungs und Verkehrsgeographie*, Berlin, 1908) is a vague and very restricted definition that denies any urban character to those agricultural centers which do not have the aspect of a village. Any attempt to enumerate the possible activities that a city lacks produces only an interminable list. Weber (1962) tried to discern the predominant character of the city, describing it as the "seat of the market." But this type of reasoning suggests just a few of the typical economic aspects of the medieval city in the Western world and cannot be extended to other periods of history. The danger of overgeneralization may be seen in the formula of H. Wagner (*Lehrbuch der Geographie*, 1923), for whom cities are "points of concentration of human commerce." According to Bruhnes and Deffontaine (1920), "a city arises every time the inhabitants spend the greater part of their time within the agglomeration." This is obviously inapplicable to dormitory towns and agricultural centers and may well be inapplicable to nonstructured clusters. Among the more recent definitions, that of George (1952) considers the city "the point of contact between industrial economy and commercial economy"; but this definition too is open to question. Of use descriptively or as a guide, although sterile scientifically, is the typological classification of human settlements according to physical aspects of the site, size, functions (e.g., commercial, administrative, political), and so forth. The only attempt to take advantage of these numerous classifications has been made by Griffith Taylor (1946).

More fruitful results have been obtained by the morphological reading of a settlement as proposed by Lavedan (1936). He distinguishes as generative elements of the plan the basic road axis, the natural routes, the relief, the eventual outer limits, the monuments (which affect traffic circulation), and the geometric pattern (checkerboard, radial, linear, spindle). If utilized critically, this method can provide a starting point for the interpretation of urban characteristics, as demonstrated by Piccinato's studies on medieval cities (1943). Toschi (1947) points out that, in the urban organism, function and form differentiate many constituent elements that should be characterized in all their internal and external particulars. Morphological analysis of the establishment, outline, and fabric of a settlement can therefore be profitably undertaken as a first step toward a knowledge of the reality of the urban phenomenon; but it can also lead to completely sterile and abstract results if the study is limited to the purely geometric and physical aspects of the plan. In its totality the city is an organism that cannot be reproduced in the schematic and static description of its skeleton without risking neglect of the dynamic element of social life, as do those who regard it as an institution that is best seen in its crystalized and cadaverous expression.

This point was profoundly comprehended by Geddes, who went beyond examination of the simple interaction between place, labor, and people, as proposed and carried out by the engineer-economist P. G. F. Le Play in his study of the relations between organism, function, and environment. Geddes taught that cities must be considered in their state of evolution and that existing conditions must be analyzed in their dynamic aspects, including negative ones. From Geddes came the definition of the "paleotechnical" city, offspring of the uncontrolled industrial revolution (which produced Kakotopia); to this he opposed the "neotechnical" phase (Eutopia), according to a typological schematization and terminology that were later widely developed by Lewis Mumford. Geddes (1915) also sharply criticized the urban dispersion and dissemination that existed in England during the first years of the century, pointing to the unwholesome manifestations of unbroken strips and swarms of houses, of those peculiar proliferations of unstructured fabric that developed erratically around and amidst industrial centers and gave rise to a new type of complex and form of urban aggregation which he labeled "conurbation."

The process of spontaneous urbanization, hastened by the individual private interests of the expanding capitalist economy, had produced an advanced stage of degeneration in England since the beginning of the century and was to be repeated in other countries with identical effects. The result was uncontrolled expansion, in some cases spread around traditional cen-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

tralized cities, with clusters of settlements springing up between the main city and encircling minor cities. Sometimes unorganized settlements emerged between cities of equal importance. Wherever they appeared, these new settlements rapidly broke the old separation between city and country, upsetting balanced urban structures (studied by Christaller, 1933) and transforming them into larger systems or into a single urban-rural continuum (Smailes, 1953).

Modern geographers (e.g., T. W. Fawcett, B. G. Chabot, and P. George) continue to call such phenomena conurbations when the original cities remain distinct although enclosed within a single whole; the term "agglomeration" is used when a high degree of interrelation and dependence is established between the city and its proliferations. In recent town-planning terminology, "city-region" (used earlier by Geddes in the geographical sense of urban region) is often used to indicate those conurbations subject to a process of town-planning administrative reordering from shapeless aggregates into structured aggregations. (In this sense "city-region" should be rendered in Italian as *regione urbanizzata* rather than the recently popular *città-regione*, as the latter term suggests a new category of super-city and implies a solution to urban problems through extension of the concept of the city.) For some English geographers (e.g., Dickinson, 1947) "city-region" indicates the tributary area functionally dependent on or served by a city — that is, the geographic-economic area of influence.

The new view of the city that includes its surrounding territory has significantly modified the traditional criteria of urban classification. Although a city of more than a million inhabitants is still called a "metropolis" (PL. 125), and a city of more than 100,000 is still a "large city," North American geographers and planners have recently introduced the term "metropolitan area." This expression describes agglomerations of more than 100,000 inhabitants containing at least one city with a population exceeding 50,000; this city must be surrounded by administratively autonomous complexes of smaller or equal size that are inhabited by people engaged primarily in nonagricultural activities. Beyond the largest metropolises there are a few outstanding "megalopolises." One such is formed by the chain of cities stretching from Washington to Boston (including Philadelphia and New York); in 1963 at least 38 million people resided on this strip of land about 600 mi. long and 50–100 mi. wide. The formation of the megalopolis is considered an irreversible process (Gottman, 1961), and it is thought by some to be the universal tendency of tomorrow.

Historical-sociological definitions of the city. Historians and sociologists have long linked the origins of the city with the origins of civilized society. But the sacred citadel, already present in the neolithic village, does not in itself characterize the formation of the city, even though it continued for thousands of years as a constituent element, just as associative and institutional characteristics do not substantially differentiate village culture from city culture. Having abandoned the abstract institutionalist theses, modern scholars agree that the transformation from village to urban culture is a complex socioeconomic fact. According to Childe (1950), the city, historically speaking, was both the result and the symbol of a gradual revolution. It was "the culmination of a progressive change in the economic structure and social organization of communities that caused, or was accompanied by, a dramatic increase in the population affected. . . ."

Stimulus for an urban revolution usually occurs when a community achieves an agricultural and technical development that permits it to produce a quantity of food greater than the quantity consumed by agricultural workers; excess production can then be preserved so that some of the inhabitants may pursue nonagricultural activities and the community can increase its technical potential. The urban revolution is therefore one of the first evolutionary stages in the balance between population, resources, and technical level. This balance has been the object of study in general economic terms from Richard Cantillon (*Essai sur la nature du commerce en général*, 1755) to Sauvy (1952–54) and Rostow (1960). Fear of inadequate subsistence for a growing population, which dominated classical economic theory and reached its extremity with T. R. Malthus's *Essay on the Principle of Population* (1798), was opposed by the sociological analysis of Durkheim (1893). Durkheim destroyed the myth of the subordination of demographic development to development of resources, showing the extent to which conditions of human concentration can stimulate division of social labor and therefore organic solidarity; this appears most markedly in the city and results in part from a need for men to keep in contact with one another. According to Durkheim's conception, which is further developed in the demographic-economic studies of Fromont (1947) and Sauvy (1952–54), it is essentially human concentration in the city that constantly urges the invention of new techniques of production by creating new needs.

Economic data alone are inadequate to explain the formation and development of the city as the convergence of the maximum concentration of a certain number of economic activities (R. M. Haig) and therefore as an example of the dynamics of spatial concentration. It should be recalled that the city did not arise as a result of fully developed technological processes — in fact, the industrial revolution precipitated the city's crises — but from the more archaic techniques, especially agricultural structuration in the Western world. According to Roupnel (1932), this structuration preceded and conditioned the formation of the city: "Grains, pastures, and pathways had as deep a significance as a Greek acropolis because Western civilization was fundamentally rural; cities were of later foundation and for a long time kept the material form and physiognomy of their rural origin." For Lewis Mumford, too, this rural origin is active and positive: It was from the village that the city derived its character of a maternal, life-giving, stable, and safe environment, rooted in the reciprocal relationships of man with other organisms and communities. The forms and values of equalitarian democracy are derived from the village.

This urban framework persisted to the threshold of the industrial revolution and strongly conditioned the development of civilization. The network of urban complexes everywhere shows a continuity that "bears witness to and symbolizes the permanence of a civilization" (Sorre, 1958). This is confirmed by the observations of Camille Julian (1913) on the "precocious use of all the sites favorable to the implantation of a city, the technique of the process of attachment to the site, and the extraordinary vitality of the urban seed if it is rooted deep enough." This is what Lavedan (1926), citing numerous examples of *in situ* reconstruction of ruined cities, calls the "law of persistence of the plan." But physical duration is only the manifestation of the great "force of coalescence" that keeps a city and its inhabitants united; as Lewis Mumford has pointed out, a social heritage is concentrated in the city, wherein the possibilities of a continuous relationship raise to a higher potential the complex activity of man. In other words, the city produces that accumulation, incentive, and transmission of knowledge and experience from which the force of coalescence continuously derives. "The city educates man," stated Simonides of Ceos. "Stadtluft macht frei" ("city air makes us free") was a saying of the early Middle Ages. To quote Park (1952): "The city . . . is something more than a congeries of individual men and of social convenience . . .; something more, also, than a mere constellation of institutions and administrative devices. . . . The city is, rather, a state of mind, a body of customs and traditions, and . . . the organized attitudes and sentiments that inhere in these customs and are transmitted with this tradition." There are numerous centers in which the strong local tradition that still appears in various attitudes of daily life receives group expression in holiday rituals, or explodes because of exceptional events. This gives the city what Marcel Mauss, using Durkheim's terminology, calls a special "tonality of life," so that each city demonstrates its own "way of thinking, of feeling and of reacting," its own "collective conscience."

Some of the most basic and characteristic traditions date back to the ancient flourishing of municipal liberty; however, settlements of far more recent origin have their own unmistakable life and behavior. But it is in large metropolises that

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

human relationships reach the greatest degree of intensity and differentiation. Of Constantinople, which in the 11th century reached almost a million inhabitants, Pirenne (*Medieval Cities*, 1939) said that it "alone, in the Christian world, . . . presented a spectacle analogous to that of great modern cities with all the complexities, all the defects, but also with all the refinements of an essentially urban civilization."

The attraction of capital cities has been examined by Chevalier (1950). Paris attracts provincials and the affluent, he says, because it is the center of government, administration, banking and monetary circulation, intellectual life, luxury, and pleasure. It consequently presents a great variety of employment possibilities, a constant demand for labor, and higher salaries, at least nominally, than those prevailing in the provinces. These possibilities favor financial speculation and social ambition.

The positive aspects of community life had been carefully noted by the Elizabethan writer John Stow in 1598 (*A Survey of London*): "Men by this nearness of conversation are withdrawn from barbarous . . . force, to certain mildness of manners, and to humanity and justice. . . ."

The city is not only a center of intellectual life; it also encourages sexuality and receives from it a stimulus that is expressed in all fields — economic, social, and cultural (Gurvitch). Studies on urban mentality and behavior by modern North American ecologists tend to stress the heterogeneous components that mark city life as a new way of life. Louis Wirth of the Chicago school has defined the city as an aggregation composed of a large and heterogeneous population densely settled upon a limited space characterized essentially as a center for "attitudes, ideas, and constellations of personality." Ericksen (1954) states that the city is "an advantageous laboratory for the study of social life because every characteristic of human nature is not only visible but magnified. In the freedom of the city, every individual, no matter how eccentric, finds an environment where he can grow and thrive and find self-expression." The individual not only reacts to the forces of his environment (classified by R. D. McKenzie, with R. E. Park and E. W. Burgess, in *The City*, Chicago, 1925, as selective, distributive, and adaptive) but also may become a creator of the environment. This is affirmed by all ecologists, particularly by Lee (1955), who starts from the ecological thesis that the city is not a static phenomenon but "a balance in permanent development." With the five concentric zones of Burgess (ibid.) in mind, Lee isolates five fundamental processes that affect the development of spatial structures: (1) concentration and dispersion, (2) centralization and decentralization, (3) segregation, (4) invasion, and (5) succession. Concentration is the tendency of individuals to gather in areas favorable to sustenance; dispersion, its opposite, is a reaction to congestion. Centralization is a grouping of the city's functions of production, distribution, and services; decentralization is the opposite. Segregation is a concentration of specific types of population or institutions in a given area. Invasion occurs when new types of populations or institutions or activities replace others in an area owing to displacement or change of intended use. Succession, which is the final cycle of the invasion process and a recurrent process in urban expansion, is reflected in situations of personal and social disorganization that can be remedied only through a new search for equilibrium. The prominence of the processes of segregation, invasion, and succession in Lee's analysis reflects situations typical of North American cities. In such a perspective the immediate aim of urban planning is the reorganization of deteriorated sections of the city rather than organized expansion.

The sociological studies of Pizzorno (1962) on urban mentality are linked to the Durkheim school, to the ecological school of Chicago, and to the theses of Simmel (1903). Simmel's work showed how the concentration of individuals in a big city and the consequent multiplication of contacts reduces those contacts to the functional, calculated, and fleeting. In Pizzorno's analysis, urbanization consists essentially in a process of differentiation between social groups: this process is "not a transformation of a small community into a large one, nor the passage from an old form of social solidarity to a new one . . ., but the rise of a new social entity which is in opposition to the preceding one while coexisting with it; it is not the broadening of a group or its deformation, as Simmel thinks, but the formation of new groups and new types of relationships between them." This "displacement in the relative position of certain groups in society," this "mutation in their functions," eventually determines a transformation of the system.

In urban sociology there has also been research relating to the theory of communications and its manifestations in spatial organization. According to R. L. Meier (*A Communications Theory of Urban Growth*, Cambridge, Mass., 1962), an urban structure can be interpreted by means of the systems, intensity, and frequency in the interpersonal exchange of messages through the various channels of communication. In this interpretation the culture of the city becomes essentially the culture of interpersonal communications, and the most suitable and fully developed urban structure is that which facilitates to the highest degree the development and organization of communications.

It may be concluded from this rapid survey of sociological definitions that the character of a given city at any moment may be understood through analysis of the dynamics of social structures and of their mutual relationships with the dynamics of the corresponding spatial structures. For decades Lewis Mumford has pursued this end with indefatigable vigor. On the subject of the city he has produced two valuable studies: *The Culture of Cities* (1938) and *The City in History* (1961). Although there may be some dispute with his approach, which is inclined toward abstract typological schematization derived from Geddes and from classical sociology, or with his tendency to base demonstrations on theses, or even with his overemphasis on the significance of technological preeminence, his work has a breadth derived from acute observation of minute detail. Mumford focuses attention on the drama of the city in history and contemporary life. *The Culture of Cities* is throughout a search for a definition of the city. Following are some of Mumford's conclusions on the social concept of the city that largely summarize the various theses developed in the above discussion of historical-sociological definitions.

"The city is a related collection of primary groups and purposive associations: the first, like family and neighborhood, are common to all communities, while the second are especially characteristic of city life. . . . The essential physical means of a city's existence are the fixed site, the durable shelter, the permanent facilities for assembly, interchange and storage; the essential social means are the social division of labor, which serves not merely the economic life but the cultural processes. The city, in its complete sense, then, is a geographic plexus, an economic organization, an institutional process, a theater of social action, and an esthetic symbol of collective unity. On the one hand it is a physical frame for the commonplace domestic and economic activities; on the other, it is a consciously dramatic setting for the more significant actions and more sublimated urges of a human culture. . . . The city fosters art and *is* art."

URBAN SPACE. *The archaic world.* Ever since the formation of definite settlements in the most archaic cultures, there has been no human society that has not realized its own artificial life environment. From generation to generation the inhabitants have exploited this environment, so that with adaptations some communities have remained viable for centuries. Certain sites manage to survive calamities and destruction over the course of thousands of years. Erbil, the ancient Assyrian Arbela, appears to have had an uninterrupted existence of over five thousand years, and there are a number of cities with a two-thousand-year history of continuous existence. Perhaps the most sensational form of survival of an artificial life environment is represented by the transmissibility of certain spatial schemes or models that link neolithic and present-day African cultures. A remarkable flourishing of settlements in the Neolithic period and in the subsequent metal ages has been brought to light, often by means of aerial photography. These settlements, which appear to be circular or egg-shaped enclosures containing groups of usually circular huts placed at random are found in Apulia (PL. 126),

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

in the Aeolian (Lipari) Islands, in Cyprus, along the Rhine and Danube rivers, and in England. They attest to a vast, dense, and ubiquitous diffusion of village culture, which precedes and accompanies the city culture. From time to time the village culture disappears, reemerging elsewhere according to an unknown scheme of development that is characterized by a constant repetition of forms which influenced not only the nuraghe settlements (IX, PL. 401, cols. 602–609), the *castellieri* of Venetia, and the Hittite and Aegean citadels but also the kraals of Negro Africa. It is in the kraal (PL. 127) that village culture continues to be found in its purest and most archaic expression. A kraal consists of an enclosure, sometimes perfectly circular, containing a group of huts that may be randomly arranged or clustered so as to indicate family groups and their respective herds. The territorial groupings of the African kraal resemble the territorial distribution of the neolithic villages in economic and physical arrangement.

The persistence of these archaic forms of settlement cannot be explained solely in terms of the adaptation of an elementary and simplified socioeconomic order to stable demographic and ecological conditions. In his *Géographie humaine* (Paris, 1922) Vidal de la Blache quotes an excerpt from G. J. Toutée's *Du Dahomé au Sahara* (Paris, 1899): "In the fertile valley of the Niger, each village cultivates around itself a suburban area within a radius of as much as 1,500–1,800 meters [ca. 1,640–1,970 yds.]. When the number of inhabitants increases, the number of houses does not increase, but a colony is started at a distance of two or three kilometers (1–2 mi.), which, in turn, founds a little village bearing the same name as the first." On the basis of this data it can be hypothesized that analogous customs of dynamic and continuous colonization were practiced by the neolithic communities. Such a supposition permits a more satisfactory explanation of land use based on a conscious maintenance of a small-size village. The reasons for this voluntary containment of the social land territorial dimensions of the community are to be sought not primarily in considerations of productive technique (which does not appear as a determining factor) but rather in the magical, cosmological, and psychological meanings implicit in the spatial form of the neolithic village, which are also to be found in the African kraal today. The peripheral circle that divides the internal space of the village from the external cultivated space repeats on a small scale the earthly horizon delimited by the ocean that is supposed to surround the earth, separating an internal order of a *fas* type from the external world, which is the prey of demonic forces. In the center of the African village is usually planted the ritual pole, representing the center of the world, with totemic insignia that symbolize both the cosmos and a phallus. Even the hut has magical meaning: the internal cavity recalls the womb, and the cupola suggests the heavenly vault. Every part of the internal space of the hut has a precise purpose, both magical and functional; and each constituent part of the village appears to be composed of internal and external elements. The big open space in the center of the village is at the same time internal and external in respect to the village and to the huts, and it is therefore a concrete symbol of the interconnection of community relationships contained and magically protected by the external enclosure that is both horizon and placenta. There is generally only one entrance, which signifies both physical and symbolic communication with the outside world.

Such a complex network of profound meanings (see COSMOLOGY AND CARTOGRAPHY) has its origins in the remote experiences of cave dwellers and nomads. At different times and in different places the symbolic structure may have assumed other patterns, but their meanings have not yet been sufficiently explored and coordinated. The system undoubtedly constitutes a basic cultural heritage upon which rests not only village culture in its more evolved stages (i.e., when the sacred area of sanctuaries and the functional area of storehouses are grouped together, and when internal community space is articulated in thoroughfares and open areas) but also urban culture, which derives from the village structure. For a scientific (and not merely technological and mechanistic) explanation of urban space, the common cultural background of both the village and the city must be examined. The persistence of basic elements may also be found in spatial models that do not include circular forms but derive from the aggregation of rectangular or square forms.

The well-known Vitruvian theory that the human form can simultaneously be inscribed within a square and a circle (XI, PL. 342), which is usually understood as a basic rule of proportion, may contain a more profound archaic meaning — namely, that abstract geometric forms derive from anthropomorphic projections and are therefore full of cosmological meaning. The archaic circular or rectangular human settlements may not have been contemporaneous; but the geometric difference cannot be explained technologically — for example, by saying that the use of long straight poles gave rise to the pile-dwelling villages of the Po Valley and, later, to the Roman castrum, as Mumford maintains. The survival to the present day of rectangular aggregations of huts testifies to the repetition of forms analogous to those of prehistoric complexes, equally full of profound ritual meanings. From the very earliest instances of settlements both the square and the circle are to be found, whether separate or joined, in various combinations and systems for the logical development of the space.

Ancient urban civilizations. At Jericho (VIII, FIG. 934), in layers prior to the 5th millennium, remains of circular houses and city walls have been discovered. Sumerian Ur (4th millennium), which lasted three thousand years, presents a highly evolved structure within an ovoid enclosure protected by walls and a canal. Equipped with two ports, one on the Euphrates and one at the head of a tributary canal that crossed the city lengthwise, Ur had a rectangular sacred zone with rectangular temples (VIII, FIG. 294), as well as a street plan based on rectangular blocks of dwellings. The houses were generally built on a square plan, closed on the outside and opening onto a closed courtyard on the inside.

The layout of Babylon (end of 3d millennium; VIII, FIG. 299) represents the extreme development of the plan of Ur. The city, situated on both sides of the Euphrates River, was at one time surrounded by a rectangular circuit of double walls that have remained famous for their thickness (ca. 88 ft. at base); along the eastern bank of the river extended the sacred precinct composed of the Temple of Marduk; the E-tamen-an-ki (House of the Foundation of Heaven and Earth), a ziggurat with seven terraces rising to a height of about 300 ft.; the Hanging Gardens; the Temple of Ishtar; and the adjoining Palace of Nebuchadnezzar. The sacred precinct was delimited to the east by a rectilinear processional road, about 75 ft. wide, paved with blocks of stone and running parallel to the river; this was the first monumental road in history. The residential sector repeated, many times multiplied, the spatial arrangement of Ur. The entire city of Babylon expressed the prevailing cosmological conception, according to which the earth was a pyramid with seven terraces surrounded by the ocean and covered with three heavens. On the highest terrace stood Babylon. The great tower of Marduk, which was a smaller image of the world and at the same time its highest step and thus the closest to heaven, was the summit and the center of the world (Schneider, 1963). With this ambitious structural model was born not only the city but also the capital city and the metropolis. Its elements were to be found repeatedly in capital cities, even after thousands of years.

Contemporaneous with Ur and Babylon were the cities of Mohenjo-daro and Harappa (VIII, PLS. 63–65; XI, FIG. 7), which arose in the 3d millennium in the upper and middle Indus Valley. They show an identical plan, with a main system of roads that is perfectly oriented north–south and east–west, separating large areas about 1,300 ft. long and 980 ft. wide. Each of these areas is subdivided by smaller networks or dead-end streets and is completely filled with dwellings on square foundations, which are closed on the outside and have rooms opening onto a small central courtyard. A complex sewage system served the individual houses (VIII, PL. 63). In both cities there was a citadel situated to the west. It was rectangular in shape, about 1,300 ft. by 650 ft., and was raised about 30 ft.

above the city level. The plans of these cities were undoubtedly permeated with magical and cosmological conceptions, of which numerous testimonies have survived in Indian doctrines.

In this tradition the city was consistently viewed as a symbol of the conception of the universe. Thus, according to Jainism (q.v.), the universe is conceived as a series of concentric circles, in the center of which is the earth. Rising from the earth is the mountain of the world, Meru (Sumeru), from which flow four rivers that divide the four continents. In Buddhist doctrine the universe also consists of seven concentric circles. Along the walls of the ideal city there are twelve gates (equal in number to the signs of the zodiac). According to the rules of the Śilpaśāstras (series of painting manuals), the plan of cities and villages follows the principle of the cosmic cross, the so-called "magic square," which represents the four quarters of the universe. There are many instances of this magicoreligious conception even in the individual parts of the city: "The dwelling house is built upon the model of the human body . . . which is the house of the soul it contains." The Indian temple is conceived as a city in miniature with spaces that "represent the enclosures for cattle, with corridors that lead to the altar and represent the spacious roads of the city leading to the royal palace, which is placed at the crossroads; there are also spaces in which the faithful group themselves around the altar, as the citizens do in the city palace; again, there are not only roads and gutters, wells and reservoirs, waiting rooms and assembly

rooms in the temple, as exactly organised as in the city, but also markets with their stalls" (E. A. Gutkind, unpublished text).

The Indian conception of the structure of space and its complex psychic and cosmic meanings expresses itself through the mandala — a composition of concentric circles and squares in which symbols, colors, and position with respect to the principal axes speak a profound language. Since in historic times the Indian city appears to be a constructed mandala, it may perhaps be not too risky to conclude that this conception presided over the foundation of Mohenjo-daro and Harappa, of whose cultures too little is known.

The religious conceptions of the Egyptians, which determined the plan of the territory, are known to the smallest detail. The Nile was the axis of the earth and was surrounded by ocean. Along its course the cities of the living were invariably placed to the east, with the cities of the dead opposite them to the west, according to a precise cosmological law. Ra (Re), the Sun, to whom the goddess of heaven gave birth each day, rose over the cities of the living and traveled through heaven in his celestial boat, crossing the Nile at his zenith; in setting he died over the cities of the dead. He then entered the realm of the dead, in which the adventurous underground crossing of the solar boat began. Since the immortal existence of the dead was the dominant value in Egyptian culture, the cities of the dead contained numerous artifacts in order to guarantee the physical immortality of the dead and the architectural monu-

ments erected for them. The cities of the living, on the contrary, were considered to be as ephemeral as their living inhabitants and were therefore almost always built of dried mud and perpetually renewed in superimposed layers that gradually raised the level of the urban ground. These cities were geared to the strictest everyday functionality, with the exception of religious buildings. They were part of a world uniformly planned by means of skillful embankment and irrigation works that covered the entire valley. Completely immersed in a single cosmological-religious concept that made every transversal segment of the valley identical to all the others, the Egyptian cities must be understood less as true cities than as residential districts of a immense urban state. The ideogram of house clusters (houses of the rich, the craftsmen, and the workers; FIG. 191) represents three fundamental elements: the external enclosure, the rooms, and the internal open space (the garden in the houses of the rich) in which the most activity occurred, as is apparent from the numerous wooden models that have outlived the original examples. The geometric scheme of the districts is sometimes square, as at Tell el ʿAmarna (PL. 128). In the later periods of the New Kingdom the urban complex tended to dissolve into an open and continuous structure, whereas, before city and regional planning was definitively consolidated, the more ancient cities (Hierakonpolis, Memphis) were perhaps surrounded by circular or ovoid walls. This is suggested by some archaic representations of the hieroglyphic for "city" (*nwt*), which in its schematic form (FIG. 191) can be interpreted as a synthesis of the urban spatial structure with crossroads and as a cosmological indication of the city, which was conceived as a symbol of the Nilotic territory itself; in the latter case, the circle of the horizon probably represents the ocean, with the crossed axes representing the Nile and the course of the sun.

The diffusion of Mesopotamian and Egyptian urban cultures on European soil occurred in Crete toward the middle of the 3d millennium B.C. They were grafted on extremely ancient neolithic cultures in a physical environment dominated by mountains and therefore totally different from the wide irrigated valleys of the Nile, the Indus, and the Euphrates. The new Minoan culture developed rapidly, spreading a different type of settlement centered around a palace with a newly conceived ground plan. The theme of the royal palace, complete with services, had already been developed in the 3d millennium at Mari (IX, FIG. 787) on the upper Euphrates. On Cretan ground the same scheme was magnified to become the dominant element of the new urban complexes of Mallia, Knossos, and Phaistos (see CRETAN-MYCENAEAN ART). All of these complexes were large; Knossos, the largest, could perhaps have housed up to 80,000 inhabitants (IV, PL. 53; FIG. 85).

The main structural and design innovations of the Minoan palace lay not only in the grouping of a greater number of rooms and in the superposition of several stories (and consequently in the dimensions of the architectural ensemble) but also, and primarily, in the introduction of a new element of city space — the closed square (at Knossos, ca. 90 × 170 ft.). It was completely surrounded by edifices and became the center of the entire spatial composition, the focal point of the palace and the city. In following millenniums this spatial model was destined to become widely successful in the design of cities that were seats of royal courts.

In later and smaller Cretan cities lacking large royal residences a new equilibrium appears. The little city of Gournia (PL. 128; IV, FIG. 91), which arose after the earthquake of 1750 B.C., contains a wiser admixture of the elements desirable for community life. The houses are adapted to the cone-shaped hill on which the city rises. At the summit are a modest palace and a vast market square — almost an anticipation of the medieval city.

Mycenae dramatically incorporates all the new characteristics of the rising urban civilization in the West. The new cities are no longer characterized by grandiose dimensions or by abstract repetition (both typical of centralized military organization) but rely on an interpenetration of elements, functions, and spaces, all minutely characterized and intertwined so as to form an organic whole. The Mycenaean cities are individualized

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

by the character of the site and by their internal activities. This is the spatial expression of a new type of community life and organization based on small urban-rural social groups (synoecism), permitting the realization of individual characteristics and pursuits outside the schematism of theocracy and universal cosmology.

The Greek city was thus enriched with new urban elements required by the multiplication of social encounters and by the independent activities of the various groups within it. At the foot of the Athenian Acropolis (VI, FIGS. 887, 890), the spiritual center of the polis, the city spread without predetermined order. The residential districts still repeated the ancient Ur pattern, but they differed profoundly from any preexisting human settlement in the wealth of public facilities — the prytaneum (town hall), the agora, the hill of the Pnyx for popular assemblies, the theater, the gymnasium, the sacred woods. These made Athens the most representative cultural center of the ancient West. The variety and free spatial combination of these elements permitted every Hellenic city to assert its own urban individuality, in which was reflected the vitality of community life and of individual or group choices. The concept of space was shorn of its mythical quality and became the object of study and philosophical speculation. Later, when there arose opportunities for the creation of new cities, for the rebuilding of destroyed cities, or for planned extension, as at Miletos, Olynthos, Piraeus, Akragas (mod. Agrigento), Syrakousai, Selinous (mod. Selinunte), Priene (PL. 129, FIG. 189; VII, PL. 53, FIG. 446), Greek town planning gave ample demonstration of its high degree of maturation and synthesis in the field of urban organization. Each one of the new urban complexes assumed a particular individuality obtained mainly through the presence, character, and spatial distribution of the buildings and the spaces for public use, which were conceived as focal elements of urban life.

The Greek city was essentially and predominantly a city of and for man. This does not mean that ancient religious tradition was absent; tradition appeared in rituals and in places sacred to the poliadic divinities. Thus the oracle was consulted as to the choice of site for the foundation of a new city. The sacred fire that was to burn in the new prytaneum was obtained and transported from the hearth of the metropolis. In Homeric times the sacred circle was in the agora; later, in the popular assemblies, the sacred circle was traced with the blood of victims who were immolated upon the altar before every deliberation. The oracle, fire, and sacred circle testify to the common origins and cosmological order of human settlements.

These same intangible factors presided over the Etrusco-Roman rite of founding cities; this rite was, however, impregnated with a spirit that was more faithful to archaic symbolism. Once the propitiatory and cleansing rites were carried out, the founder dug a small circular ditch (called a *mundus* in reference to the Mani region and the cosmos), into which he threw a few clods of earth from the city of origin (*terra patrum*); over this was placed the altar, and then the fire was lit. Around the urban hearth thus constituted, the perimeter of the city was traced in a square, just as a house would be built around the domestic hearth. The founder then cut with a plow the ritual furrow upon which the walls were to be built, interrupting it at points where gates were to be placed. The *pomerium*, a strip of ground inside and outside the city wall that could not be built upon or cultivated, physically completed the sacred area of the city. The ancient cosmological-religious meanings inherent in the geometric symbols (circle, square, main axes) of which the Roman city was formed were to remain sufficiently alive to pervade the whole of Roman civilization for centuries to come.

As cities multiplied, the urban structure, which was determined by the presence of certain basic public structures, particularly the forum, was simplified and reduced to a scheme for reasons of political expediency and speed of execution. A single Greco-Roman urban culture rapidly amalgamated the peoples of Europe, superimposing itself upon the preexisting cultures and integrating itself into their traditions. The only exceptions were Rome (VIII, FIG. 515) and, later, Byzantium, in which imposing civic architecture and spaces dedicated to public use took on a political and sociological significance that exalted them beyond measure — that is to say, the established structures dominated, even suffocated, the city of men. The extraordinary fascination of Babylon still existed in man's collective memory, as witnessed by the Biblical description of the heavenly Jerusalem: "And the city lieth foursquare, and the length is as large as the breadth: and he measured the city with the reed, twelve thousand furlongs. The length and the breadth and the height of it are equal" (Rev. 21:16). In other words, it was envisaged as an immense megalopolis stretching some 1,400 miles on each side.

The medieval city. The dissolution of the political and cultural unification created by the Romans was accompanied by a rapid and almost total economic-demographic recession, which was hindered, however, by the new Christian culture that was taking root. This new culture created the conditions for an almost contemporaneous and homogeneous social and economic revival in scattered centers that were either autonomous or only nominally coordinated. The reawakening of urban vitality in Europe after the year 1000 had certain universal characteristics. The complex cultural stratification, in which were present not only the most archaic aboriginal roots and the residue of Roman homogenization but also more recent ethnic grafts, was once again amalgamated by the widespread and deep-seated religious unification. There were also objective conditions of demographic dimension and group isolation that permitted economic revival only in circumscribed and noncommunicating zones. Although Roman universality was still pursued as a vague ideal, it could no longer recreate itself politically; however, it persisted at an ethical, juridical, linguistic, and cultural level.

Thus began an essentially new urban socioeconomic culture based on the small self-sufficient community that restructured the European territory into tiny autonomous urban and rural aggregations. Many such aggregations revived the Roman *municipii* (towns), *pagi* (villages), and *vici* (quarters), or they associated themselves with villas, courts, parishes, and monasteries; others reestablished and developed port and mercantile functions; still others were created *ex novo* in a fervor of colonization and urbanization. It was with this urban revival that modern Europe began its uninterrupted development.

In this renewed cultural, economic, and social context, both generalized and locally differentiated, all medieval cities reveal a common inspiration together with the affirmation of an autonomous individual characterization. The only profound differentiation occurred between the feudal complexes and the free communes. The elements of city building still derived fundamentally from Greco-Roman culture, but each element was altered in terms of a different conception of human relationships and consequently of space. The medieval city, which was equipped with its own statutes and ordinances, was a concentration of artisan and commercial activities, a place of daily meeting and exchange with inhabitants of the surrounding countryside, the destination on fixed dates of mercantile activities covering a vast radius, and a religious, cultural, and political center; it was therefore a complete microcosm. To an outsider the city seemed an autonomous entity circumscribed by walls and placed within its own agricultural landscape, which was fully elaborated and humanized. The city was recognizable from afar by its particular skyline of towers, roofs, and spires; thus the skyline became a collective symbol with which the citizens identified themselves. The emergence of a cathedral or the preeminence of a municipal tower (I, PLS. 396, 399) or a counterbalanced composition of elements immediately communicated the fact of ever-present religious-political strife. Basically, however, every city, especially in the early Middle Ages, was viewed as a terrestrial image of the City of God in which celestial spirits fluttered among spires and towers. The silhouette of the city supported this image. Everywhere the church was considered the "mother" of the local community, and there was an abundance of architectural allegories and symbols to suggest this. The citizens were gathered together

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

in the arms of the city, and the structural mass of the church became the focal point of urban life. The medieval city was also characterized by a love of life according to the principle of "good government" (see IX, PLS. 194, 195).

The urban structure expressed this dynamism, emphasizing routes and meeting places. Even private residential space modified the ancient Oriental and Greco-Roman traditions. The house lost its introverted character and its air of intimate repose and hostility toward the outside world. It became a productive, extroverted complex almost always composed of three elements: living quarters, workshop or warehouse, and kitchen garden; the workshop and living quarters faced the street. Reflecting the new necessity for closer human relationships, houses were placed next to each other in long continuous ribbons, and streets became common thoroughfares and places for pause and exchange, social tension, and therefore life (I, PL. 399). Consequently the street environment was controlled by statutory norms and regulated by the *magistri viarii* or even by collective consultations. Urban life was innerved along a series of routes converging on the religious or secular focal points, where the greater massiveness of the buildings was counterbalanced by open spaces that provided a favorable setting for personal as well as business exchanges. At these points civic life was busier on market and feast days and on occasions when spectacles were presented or important decisions were made.

Because of this vitality and complexity, every medieval city must always be considered from two points of view: the synthetic one that grasps the unity of structural and symbolic elements, and the analytic one that minutely examines the city's internal life as revealed by the network of focal points and dynamic thoroughfares. The medieval city displays a complicated arrangement of physical structures that are freely articulated upon numerous internal spaces and geometric plans that are variously combined. This harmony of structures and space, which constitutes the greatest expression of medieval urban design, may be seen in the arrangements of piazzas in Padua and Verona (I, PL. 402) and in the multilevel spatial compositions of Assisi and other Umbrian cities. Thus it is difficult to understand medieval cities such as Perugia (VII, FIG. 655), Rothenburg (FIG. 189), or Carcassonne (V, FIG. 658) from two-dimensional projections alone. By contrast, the frontal or perspective representations of the 16th and 17th centuries, although imprecise, are far more clear (PL. 131, FIG. 201). Two-dimensional street-layout schemes, by simplification, nullify those elements of differentiation and vigorous individuality which constitute the essence of medieval town planning.

The new conception of urban space during the Middle Ages consists precisely in the discovery of the minute, multiple, and free combination of elements, which are exempt from all classical canons. This approach is evident in the spatial composition of the newly created medieval cities and in the planned expansions. The actual plans of some of the new cities, the planned expansions, or the rarer duplications of cities on opposite river banks do not derive from mechanical repetition of abstract geometric schemes drawn from the Roman repertory. Examples of planned cities are Lübeck (1143), Bern (1191), Castelfranco Veneto (1199), Cittadella (1220), Aquila (1250; VIII, FIG. 688), Massa Lombarda (1251), Cittaducale (1309), Aigues-Mortes (1246), Montflauquin (1256), and Montpanzier (1284). Planned expansions are evident in Massa Marittima (1228) and Brescia (1236–49). Examples of duplication are found at Carcassonne (Ville Basse, ca. 1280) and Dresden (Neustadt, 14th cent.). These plans are examples of individual spatial inventions of constructed masses, squares, and dynamic thoroughfares. The whole is elaborated by a capillary network and suggests Greek spatial concepts, which are freely expressed and almost reinvented (PL. 130). The medieval talent for interpreting classical schemes is also expressed in the settlements on preexisting Roman sites (e.g., Lucca, VIII, FIG. 632; Padua; Reggio Emilia; Cologne, VI, FIG. 277; Leicester). In these the ancient Roman outline survives, but the checkerboard pattern — little by little modified, eroded, reinterpreted — appears almost completely created anew.

The Renaissance city. The transition from medieval to Renaissance town planning occurred when articulated spatial combinations were supplanted by unitary spatial compositions that were conceived artistically according to new Humanistic cultural orientation and the new thematic interests of the princely courts and rising mercantile-capitalistic society. Individual workmanship became more important and often contained a significant urban-design component. Brunelleschi's dome (1418–36), for example, not only redefined by its mass all the spaces in the surrounding area but also heightened the profile and composition of the entire city; it became from that moment the compositional pivot and inseparable symbol of the city (I, PL. 396; II, PL. 365). Often, however, a work remained an elegant and solitary fragment, as did Brunelleschi's Piazza dell'Annunziata in Florence. Begun in 1419 with the Ospedale degli Innocenti (II, PL. 366, FIG. 656), the piazza proposed as an urban theme the extroversion, for public use, of the claustral motif. Later, the closed arcaded piazza derived from the agora and the forum was altered in accordance with subtle discourses on proportion and perspective that composed the new spatial mathematics of Humanist culture (PL. 132). The Florentine model spread, with varied application, to the Piazza Ducale (1425–85) by Bramante (q.v.) in Vigevano and to the piazzas in Carpi and Faenza, and it very soon became emblematic of the fragmentary town designing of the early Renaissance.

In contrast to the great urban flowering of the 13th century, the 15th and 16th centuries saw few occasions for outstanding renewal or expansion projects in existing complexes. Among the more famous, however, are the renewal of Pienza (1460; I, PL. 390) by Bernardo Rossellino, which was undertaken on the initiative of Enea Silvio Piccolomini, and the addition to Ferrara in the time of Duke Ercole I d'Este (1431–1505), which was planned in 1492 by Biagio Rossetti and carried out by him within a few years (VIII, FIG. 605). The redesign of Pienza was limited to an extremely small, well-proportioned architectural composition for a princely center; the addition to Ferrara, although admirable for its extent and refinement, produced no substantial innovations in the characteristic structure of medieval additions or new cities and must therefore be considered a development of traditional medieval urban design.

If actual achievement was scarce in those years, conceptual preparation was fertile; all the best minds of the last half of the 15th century were involved in theoretical investigation, including Alberti, Filarete, Francesco di Giorgio, and Leonardo (qq.v; see also TREATISES). The discovery in 1414 at Montecassino of *De architectura*, a manuscript by Vitruvius, initiated theoretical research in town planning. Printed in an incunabulum edition in 1486 and in several later editions, it influenced Renaissance thought promptly and decisively. Alberti's *De re aedificatoria*, written in 1450 and published in 1485, launched a series of treatises on the art of building in which city planning was included as an integral part of the discussion. While Alberti's description of the city reproduced schemes of medieval planning, then understood in the light of Vitruvius's theories, Filarete's architectural treatise, written in 1464 and printed in 1490 (I, PL. 406), described new schemes for the ideal city that differed from their medieval sources in the quest for a single abstract conception that could be expressed in theoretical models, each geometrically individualized and defined. These models were surrounded by elaborate defensive enclosures and were characterized by spatial compositions derived from the rigorous application of bilateral symmetry or rotatory symmetry (PL. 144). In both cases the crossing of axes (the radial principle) defined the geometric barycenter of the city, which was marked by a symmetrical piazza or, as in Sforzinda, by a public edifice on a central plan — a return to the ancient cosmological conceptions (PL. 144; III, PL. 484).

An important contribution to the theoretical geometrization of the city was the work of Francesco di Giorgio (d. 1502; FIG. 221), who left an unpublished treatise on civil and military architecture (1492; Turin, 1841) replete with schematic examples. Technical devices such as two-level streets (PL. 144) and various types of fortifications were invented by Leonardo, whose most significant conceptual contributions in this field were his

studies on the hydraulic drainage of vast territories and his famous plan for decongesting Milan: "There will be ten cities, five thousand houses with thirty thousand inhabitants, and you will separate the great congregations of peoples. . . ." Leonardo's principles are precursors of the criteria of modern city and regional planning.

Renaissance treatise writing became prolific in the first half of the 16th century and included the works of Fra Giovanni Giocondo (1511), Albrecht Dürer (1527; PL. 144), and Pietro Cataneo (1554; FIG. 221). But the decisive contribution to town planning during that period consisted less in the multiplication of geometric inventions defining a spatially and functionally ideal city, and more in the development of new ideas regarding social and political organization. Although derived from the ancient Platonic conception of the ideal city, these ideas developed the theme of social relationships in a new way and constitute the first exploration of possible ideal models. The first important work along these lines was Thomas More's *Utopia, or the Best Form of Republic*, edited by Erasmus of Rotterdam and published in 1516 at Louvain. Thomas More described "the wise and goodly ordinances of the Utopian among whom with very few laws all things be so well and so wealthily ordered that virtue is had in price and estimation and yet all things being there common, every man hath abundance of every thing." With prophetic intuition More theorized on modes of legal punishment, on garden cities, on artificial incubators, on gardening competitions, on euthanasia, on obligatory work, on the six-hour working day, and so forth.

This protosocialist matrix served as a starting point for the Italian rationalistic utopias of the second half of the 16th century. Anton Francesco Doni, in his *Mondo savio e pazzo* (1552), described the ideal city as "a perfect circle and planned like a star" with a hundred streets and a hundred gates, in which all labor is rational and universal equality reigns. Patrizi (*La città felice*, 1553) and Agostini (*La repubblica immaginaria*, 1575) also made contributions to this quest. Research on the ideal city reached its limits in the second half of the 16th century and thereafter diminished, except for a few abstract and formal exercises predicated on a deliberately imaginary city whose institutions reflected escapist attitudes and a search for refuge (see also below, *Modern utopias*).

While the interest in formal research and social and institutional reform was developing, important practical experiments were being made in renewing the conception of spatial composition. The peak of perfection was attained in the Piazza S. Marco, Venice, during the first decades of the 16th century. Against the compact monumental complex of the Basilica of S. Marco and the Doges' Palace is set the enormous empty space of the long piazza (PL. 132; I, PL. 402). Its divergent sides open toward the basilica and are delimited by highly rhythmic buildings. Through perspective, attention is drawn to the portals of S. Marco, the focal point of the entire composition. The piazza's right-angle turn, pivoting on the vertical axis of the 13th-century bell tower, emerges in the well-proportioned piazzetta and ends beyond two symbolic columns (VI, PL. 340), where it opens onto the transparent veil of the lagoon, animated by boats at their landing stages against the distant silhouette of the Church of S. Giorgio Maggiore (XII, PL. 49). As a spatial composition whose elements are heterogeneous, whose means are simple, and whose poetic results are skillful, it has never been equaled.

In Rome a renewed interest in urban design was initiated from the middle of the 15th century under Pope Nicholas V (1447–55). Nicholas began the Vatican palaces and entrusted the plan of the *borghi* to Alberti (I, PL. 403). From then on, great construction works succeeded each other without interruption for a century and a half. First came the reorganization of the ancient street network with the opening of new important arteries such as Via Giulia (under Pope Julius II, 1503–13), Via Paolina Trifaria (now Via del Babuino; under Clement VII, 1523–24), Via Trinità (now Via Fontanella Borghese), and Via Condotti (under Paul III, 1534–49), as well as the regularization of important ancient roads such as Via della Lungara and Strada Pia (now Via XX Settembre). The individual arteries lead out into the over-all polycentric organization of the city, based on the axes of the processional routes and on the focuses of the basilicas. This plan, laid out by Domenico Fontana with the advice of Sixtus V (1585–90), and including the Strada Felice (now Via Sistina and Via Quattro Fontane) and Via Merulana and Via Maggiore (now Via S. Giovanni in Laterano), was largely carried out during the pontificate of Sixtus V. Rome was thus developed with a basic skeleton that would contain the flourishing construction of palaces and churches. These were located near one another and were joined into a whole, giving expression and vitality to the old and new streets. The old city was reworked in order to create new squares and buildings that animated the urban profile and everywhere created a complex architectural agitation. It was a highly exceptional manner of interpreting urban space. All the relevant experience of the classical, medieval, and Renaissance eras were present together, and the new was perpetually created out of the living culture. The city as a whole took on the significance of an enormous laboratory for architectural experimentation. Roman urban space, so charged with individual vitality, no longer had anything in common with medieval urban space or with the spatial requirements of Humanism or the Renaissance. The individual features did not arise from the simple, common life of the people, or from calm intellectual contemplation, or from an abstract universal vision, but were on each occasion prompted by multiple expressive, dramatic, and commemorative meanings. From the first decades of the 16th century, Roman urban design passed from the Renaissance to the baroque; Michelangelo's Piazza del Campidoglio is one of the first and finest manifestations of this transition (PL. 132; I, PL. 390).

By this time, Florence, Venice, and Rome were centers of cultural irradiation. Thus there arose completely new enterprises and transformations of medieval urban environments: the plan of Castro (1530), designed and executed by Antonio da Sangallo the Younger; Palladio's (q.v.) loggias in the Piazza dei Signori (1549–1614; XI, PL. 35; XIII, PL. 238) and the Piazza delle Erbe, both in Vicenza; Vasari's (q.v.) Via degli Uffizi (I, PL. 396; IX, PL. 312), along one side of Piazza della Signoria in Florence (1560; I, FIG. 647); new streets laid out in Perugia and Genoa (ca. 1550) by Gian Galeazzo Alessi; and the planned urban renewal of Sabbioneta (1560; FIG. 209). By the middle of the 16th century, Italian urban design was so fully developed in both ideas and experience that it began to spread to other countries. Italian Renaissance models can be easily recognized in the new French cities of Vitry-le-François (founded 1545, after a project by the Bolognese Marino; PL. 133) and Nancy (founded 1588, after a project by Jérome Citoni), in the new Maltese city of Valletta (1560; IX, FIG. 415), in the cities of Polish colonization such as Zamość (founded 1578, after a project by Bernardo Morando from Padua), and in the architectural elements of the principal instances of town planning in the capital cities. The new Renaissance conception of urban space was taken as a model for the five *places royales* that opened the medieval city of Paris to the new idiom. The first of these, the Place des Vosges (1606; long considered the *place royale* par excellence), reverts to the motif of the enclosed, arcaded square of Brunelleschi's Piazza dell'Annunziata; the volumetric proportions are different, however.

The baroque city. In the Renaissance, urban design was always the result of individual artistic creation, although it was imbued with spatial mathematics founded on symmetry and perspective axes and focuses. Rectilinear street plans were animated by a diversified mixture of buildings that were individually characterized. Although the plazas and widenings in the street pattern took the form of regular geometric figures, they were vitalized by architectural combinations that seemed frequently disparate yet skillfully juxtaposed, but not without a certain harshness — all in the search for a complex but nonmechanical and dynamic equilibrium. The medieval tradition of free spatial composition continued to invigorate the urban fabric even through the filter of the artistic expression of the Renaissance.

The spatial conception of the Renaissance took on a new

character when architectural uniformity extending over large areas was joined with the regular pattern of streets and plazas, when the rhythm of architectural volumes was deliberately intensified in a somewhat theatrical manner, when regularity and dynamism were skillfully combined, and, above all, when aulic and celebrative meanings infused the urban spaces. These new spatial conceptions expressed themselves in a mode suited to the Counter Reformation, the splendor of the courts, and the tastes of the nobility. The fundamental components of the new baroque style were architectural regularity along the straight avenues and around the plazas, perspective approaches to courtly monuments, broad flights of steps, fountains and ornamental water displays as urban furnishings, the predominance of increasingly large spaces, splendid extra-urban residential establishments,) and formal gardens. With these developments the city assumed a dimension that made it increasingly remote from the life of the common people — a life that was confined to its own districts. These districts were then separated by large architectural spaces that were no longer conceived as places for human encounter; rather, they became rapid thoroughfares for carriages in movement to and from the centers of presentation and power within and without the city. The baroque scheme arrogantly superimposed itself upon the preexisting city, as in Palermo (PL. 134; VIII, FIG. 750), where the Cassero (1564–81) and Via Maqueda (1597), intersecting at the piazza known as the Quattro Canti (1611), cut deeply into the ancient city fabric. Cities were thus often brutally fragmented by the new spatial schemes and, with few exceptions, were adapted to the new functions of urban capitals.

Two cities, Amsterdam and Turin (PLS. 133, 134), which developed rapidly from the first decades of the 17th century, were able to escape the pompous baroque schematisms and to create formally and socially balanced complexes while utilizing the new baroque spatial repertory. Amsterdam is famous for its plan of 1593, which gave the enlarged city the shape of a semicircular crown arranged around the ancient nucleus and divided by three large canals (X, FIG. 585). The city plan was speedily effected (1612–63), using land previously acquired by the municipality. Upon each residence and merchant's shop or warehouse was the stamp of a highly civilized and egalitarian way of life. Amsterdam was a prosperous, cultured, commercial, and openly Protestant city in which there were no great class inequalities and waste and ostentation were considered offenses. The population was able to multiply fourfold in fifty years, and the communal administration adopted thoroughly modern business practices in the construction of the city and management of the port.

Turin (VIII, FIG. 537) in about a hundred years and three successive planned phases of extension (1624, 1673, 1714) — the last the work of Filippo Juvara (q.v.) — grew from a small Roman city to a capital city, and then to a small state, skipping every intermediary phase. More important, through strict control Turin has maintained a measured and acceptable spatial equilibrium in which stand out, with their restrained vigor, the works of Guarino Guarini (q.v.) and Juvara, among whose masterpieces is the nearby hunting lodge of Stupinigi (PL. 134; I, PLS. 389, 407; II, PL. 141). The city is homogeneous and coherent, and its baroque elements are widespread, even at the popular level.

For two centuries baroque spatial inventions predominated in Europe. They were abundantly applied in the building of new cities, including Palmanova (PL. 144), Richelieu (1635), Mannheim (1648), Suarlouis (1681), and Neuf-Brisach (1698) — the last two based on plans by Sébastien Le Prestre Vauban (1633–1707). These inventions, which became the compulsory formula for European capital cities, can be noted in the series of planned urban centers that arose in Sicily after the earthquake of 1693 — Grammichele (1700), Noto (1703), and, in the same years, Augusta, Catania, and Ragusa (PL. 134) — and in the new royal establishments at Versailles (1662; VIII, PL. 437) and Karlsruhe (1715; VI, FIG. 258).

In London the canons of baroque composition, introduced with the detailed plan of Covent Garden (1630), were followed in the plan by Christopher Wren (q.v.) for the reconstruction of London after the fire of 1666, which was realized only in the environs of St. Paul's Cathedral, and in single projects such as King's Square (1681), Soho Square, Grosvenor Square (1695), Bedford Square (1770), and Bloomsbury Square (1776). These squares introduced the closed square with homogeneous architecture and a central garden. Extensive application of this new spatial model appears in the plan of Edinburgh (1776; VI, FIG. 805), while in Bath (VI, FIG. 790) architectural modeling in the form of rectilinear, semicircular, semielliptical, and sinuous blocks is fully realized in the Circus (1754), Royal Crescent (PL. 135), and Landsdowne Crescent (1794).

In Rome the baroque scheme, already formed during the 16th century, continued for two more centuries to absorb the works of great masters from Bernini to Borromini (qq.v.) and to be enriched with dramatic new spatial creations, including Piazza S. Pietro (1656; I, PL. 405), Piazza Navona (I, PL. 402, FIG. 647), Trinità dei Monti (1723–25; II, FIG 303), and Piazza di S. Ignazio (1727), each of which represents a complete work and an original exploration of new spatial compositions (FIGS. 205, 209).

Paris, which was experiencing continuous growth, remained obstinately hostile for centuries to every form of planning (V, FIG. 537). As early as 1623 Louis XIII, who deplored speculation in building sites and the disorder caused by construction, tried vainly to establish geographic limits to the growth of the city; in compensation, he resumed construction of the Louvre in 1629. Under Louis XIV and the superintendence of Colbert at least 1,914 "off limit" constructions were censured in 1671, providing documentation of the degree to which Paris was developing in a manner described as "tentacular" or "like a spot of oil." In 1674 new boundaries were fixed, and in 1675 the first general plan based on a precise topographical survey was drawn up by Nicolas François Blondel and Pierre Bullet. Known as the Plan d'Embellissement, it provided for the opening and widening of a series of streets ("pour faciliter la communication des quartiers"), systematization of the quays along the Seine, installations for the conduction and distribution of water, new city gates, armories scattered about the city, and the creation of a promenade with four rows of trees — the first of the boulevards.

The plan of 1675, largely carried out by Colbert, applied norms for the protection and recovery of positive values in the organization of the city and constituted the first comprehensive infrastructural framework for Paris. It is considered the earliest example of an operative plan intended for short-term realization and drawn up with a view to the immediate requirements of urban life. However, another baroque plan, consisting of works erected "à la gloire de Louis XIV," was subsequently superimposed on the Plan d'Embellissement. In 1662 or 1664 execution of the grandiose plan for Versailles was begun, followed by the transformation of the palace (1669) according to a design by Louis Le Vau (q.v.). In that same year André Le Nôtre (q.v.) began the Tuileries (VIII, PL. 438). The year 1685 saw the beginning of two other royal plazas — Place des Victoires and Place Vendôme (X, PL. 153), each planned by Jules Hardouin Mansart (q.v.) and conceived as a setting for a royal statue. Generally the monumental works of homage to Louis XIV arose sporadically and without a comprehensive vision; they nevertheless increased emphasis on the course of the Seine, thus redefining the ancient north–south axis of the city.

Paris continued to grow beyond the old pre-1675 boundaries and beyond the new outlines of 1724 (FIG. 201). Expansion was the undisputed field of private speculation, with many intentions and few accomplishments, which was denounced by Voltaire toward the middle of the 18th century in his *Discourse* ("Ce qu'on ne fait pas et ce qu'on pourrait faire") and in his *Embellissement de la Ville de Cachemire*. In 1748 a competition was launched to enrich Paris with squares in honor of Louis XV (FIG. 209). The results were assembled by Pierre Patte in *Monuments ériges en France à la Gloire de Louis XV* (1765) and presented in the form of a general plan that, by adorning the city with squares, would have swept away nearly all preexisting elements. The work is an example of the extreme degeneration of baroque town planning.

During the last decades of the *ancien régime* the trigonometrical survey of the city was begun (1784) by Verniquet, superintendent of roads. In 1793, on the basis of this survey, the Commission of Artists, headed by Verniquet himself, formulated a plan for the development of zones containing confiscated ecclesiastical properties and for a system of new streets, among which the Rue de Rivoli, executed in 1801 under Napoleon I, assumed great significance owing to its examplary use of space in the urban context. However, the temptation to courtly and theatrical display was not yet subdued; it was to arise once more under Napoleon III with a plan calling for demolition on a huge scale and the construction of a network of boulevards, which was carried out by Haussmann (FIG. 209).

With its progressive conquest of Paris, baroque design achieved predominance throughout Europe. Paris served as a model for St. Petersburg (founded 1703; now Leningrad), but the construction of St. Petersburg, rather than proceeding in a planned manner as in other newly founded cities or princely residences, dissolved into a series of isolated schemes. The original plan by Le Blond (1717; FIG. 209), inspired by late Renaissance models of ideal cities, was soon abandoned, and the city owed its character more to the majesty of edifices by Domenico Trezzini, K. I. (Carlo) Rossi (PL. 241), and Bartolomeo Rastrelli than to the 1753 plan designed by the Academy of Sciences and Arts. Buildings of powerful dimensions, enormous gardens, and miles of architectural prospects lining the water form a strikingly impressive baroque complex.

Similarly, Copenhagen (IV, FIG. 345) had tried in 1627 to expand in accordance with the schemes of ideal cities by adopting an ingenuous star plan with 16 radials, which was only partially carried out (e.g., Nyboder, the seamen's quarter, 1631). In 1749 a new and more extensive plan was adopted and the monumental Amalienborg complex was laid out (PL. 135), consisting of an octagonal plaza, whose axis runs from the Marble Church to the canal, and the royal palaces facing it.

Other cities that expanded in accordance with baroque plans were Stockholm (plan of 1640; XIII, FIG. 753); Vienna (II, FIG. 154), with its monumental complexes from the end of the 17th century; Berlin (VI, FIG. 239), which began to expand after 1733 on a strictly baroque plan; and Lisbon (XI, FIG. 533), where the plan of reconstruction after the earthquake of 1755 included large blocks and rectangular edifices overlooking the Praça do Comércio, which opens onto the Tagus River (PL. 134).

Thus for two centuries, as we have seen, baroque spatial models constituted the unifying matrix of European urban design. But the baroque conception was not limited to Europe. Its models were widely imitated in the cities of the New World, from the plan of Philadelphia by William Penn (1682) to that of Washington, D.C., by Pierre L'Enfant (1791). Echoes of the baroque tradition, cloaked in neoclassicism, were further prolonged in the United States and Europe during the first half of the 19th century (see figs. in UNITED STATES OF AMERICA).

In all urban compositions of any value, an underlying element is the use of baroque spatial models, which were reproduced without substantial innovations, sometimes correctly but more often in a coldly academic manner. Such urban compositions range from the fantasies of Claude Nicolas Ledoux (q.v.), which were expressed with a modernity of intention in the Ville des Salines (1773), to the broad plazas and long, straight streets of Paris designed by Gabriel (q.v.) and Haussmann, the piazzas and districts of early-19th-century Turin, the monumental center of Helsinki (first half of 19th cent.), and the layout of the Vienna Ring (1853; PL. 135). The baroque conception of urban space eventually lost its vitality and became purely formalistic. The industrial revolution was imminent.

Disintegration of urban space. From the middle of the 19th century to the present day, in all countries with long-standing urbanization, a process parallel to that of economic development has occurred: the disintegration and recomposition of urban space. The process passes through various stages that involve, first of all, a rapid and widespread deterioration of both the more ancient urban fabric and the fabric formed or consolidated according to baroque spatial conceptions. Next occurs the disintegration of the new spatial elements in the process of being formed, owing to incoherent and excessive dispersion or concentration. And finally there is the laborious attempt to reestablish the urban and territorial space in accordance with still-evolving aims and conceptions.

The early phase of the degenerative process begins in the compact settlements contained for centuries within the physical limits of fortifications and now overflowing with an expanding population. An increasingly pronounced architectural degradation appears. Unhygienic and inhuman conditions of overcrowding occur and are encouraged by relentless building speculation. The earliest and most acute manifestations of the degradation of urban space during this period were contemporaneous with and resulted from the beginning of the industrial revolution; they are called slums, hovels, *taudis* in France, *bassi* in Naples, and *catói* in Palermo. They have been denounced by writers and moralists, including Victor Hugo (*Notre Dame de Paris*, 1831), Friedrich Engels (1845), and Charles Dickens (*Nicholas Nickleby*, 1838–39; *Hard Times*, 1854), and by the first inquiries into hygienic conditions, such as the report by Edwin Chadwick (1843). For decades these conditions constituted one of the most dramatic products of the rising industrial civilization. Intervention favoring abolition of the unhealthy and unacceptable conditions found in overcrowded and degraded districts began toward the second half of the century, originating in various places from the devastation caused by fire (e.g., Hamburg, 1842; London, 1861; Constantinople, 1870) but primarily from epidemics of Asiatic cholera that raged in the more congested districts of port cities (Naples, 1884; Venice, 1885; Hamburg, 1890). Almost without exception, community intervention followed the Haussmann technique, which was based on two related operations: razing of the districts considered to be unhealthy and reconstruction by superimposing a new urban plan on the effaced pre-existing scheme. The new plan was often marked by baroque academicism and was characterized not only by wider spaces for circulation but also by larger buildings that would guarantee a financial profit. The Haussmann technique was justifiably applied to the elimination of workers' cottages of the English type, which were the result of shabby and ephemeral speculative construction in the 19th century; their radical abolition was, in fact, the only possible solution. But the technique was also applied in the so-called "redevelopment plans," which produced irremediable deterioration in such historic cities as Naples, with the opening of the Rettifilo (1885); Florence, in the zone surrounding the Piazza del Mercato Vecchio (now Piazza della Repubblica, 1885); and Venice (1891), where, fortunately, only a small amount of redevelopment was actually carried out. There were also projects for the "liberation of monuments" that employed a similar technique and resulted in equally serious damage to the urban environment. These projects led to the disfiguring of the spaces in front of the Cathedral of Notre-Dame in Paris (ca. 1830), the Cathedral of Milan (1860), the Collegiate Church of SS. Michel et Gudule in Brussels (1861), and the cathedrals of Rheims (1862), Chartres, and Coutances (end of 19th century). Modern criticism condemns these operations, but they inspired a long series of interventions and were deeply lodged in official thinking for almost a century. Rehabilitation and the so-called "liberation of monuments" cut into the urban fabric with violence, removing entire building masses, upsetting archaic spaces and relationships, and arbitrarily introducing obviously foreign elements whose only common denominator was the cynicism of financial calculation and academic eclecticism. Outside the compact built-up areas, however, another building explosion was occurring. This was the second stage of the disintegration and disfigurement of traditional urban space. This stage did not take place everywhere simultaneously or in the same manner.

In some cities, during the last decades of the 19th century, urban planning continued in the ancient medieval and baroque traditions. These were the cities least influenced by the pressure of the tumultuous industrial development. Thus, in the second half of the century Turin continued to expand in accordance with the tradition established in its extension plans. But

even these plans succeeded one another at an increasingly rapid rate without any comprehensive vision, which was to be attained only in the 1908 plan. From 1852 Genoa resumed the tradition of planned expansion with a succession of detailed plans that produced the measured and highly dignified aspect of the Via Assarotti (1852) and the panoramic airiness of the Circonvallazione a Monte. The development of Genoa was governed by a series of plans that succeeded one another without interruption until 1920. Similarly, with the 1865 plan by Giuseppe Poggi, Florence anticipated the technique of a general plan for the circular extension of an existing city; this technique is found again in expanded form in Cesare Beruto's plan for Milan (1889). Thus Rome, which experienced a building boom between 1870 and 1887, developed along the lines projected in the extension plans of 1873 and 1883 (although on a reduced scale) until the general plan of 1909. A similar situation prevailed in Amsterdam, where the plan for expansion to the south, drawn up between 1902 and 1915 by Hendrik Petrus Berlage (q.v.), was being executed throughout the twenties; it constitutes an exemplary model of the formal coherence of the so-called "romantic school." Each of these cases concerns purely residential extensions, to which the rules of neoclassic town planning were still applicable in some ways.

Where industrial initiative was strong, formal limitations no longer sufficed. Industry was intolerant of any restrictions and presumed itself to be a sufficient guide for the entire economy and thus for all the social relationships involved. It very soon imposed its requirements on historical cities that had been subjected for centuries to formal planning. Factories and rental housing formed the new aspect of English industrial cities for many decades. Unplanned suburbs, devoid of any regulatory system or disciplined solely by elementary norms of street alignment, soon crowded around the historical cities and spread in a tentacular and disorderly fashion on the territory along the old road systems. New urban complexes arose wherever favorable factors for industrial location were present; they lacked specific norms or predetermined plans and existed solely to fulfill business programs.

The new means of public transport — railroads, subways, trolley lines — at first followed the course of the old roads and reduced the time of transit, producing both an intensification of traffic and a lengthening of interconnecting routes between different urban and extra-urban areas. The old center of the city, which had been the traditional crossroads and a place for pause and exchange, became increasingly overworked and congested by traffic. These centers also became the coveted target of highly profitable real-estate operations, which were stimulated by the growing centralization of commercial interests and by the increasing revenue yielded by centrally located properties.

From the first years of the century the over-all urban structure could no longer be separated from the dynamic element, and the network of public transportation in large cities soon became an infrastructural framework capable of rigorously conditioning urban development. Transportation engineering thus assumed a position of preeminence in the field of town planning. The turning point in urban transport, however, came with the widespread use of the private automobile, as a result of which the tentacular development of large cities was no longer conditioned mainly by the network of public transport. The dispersion of economic activities and residential building are, in fact, favored by the individual and autonomous transports of persons and goods, which furthermore entered into competition with the old means of transportation.

The manifestations of this new individualistic and dynamic use of space were not long in appearing. There were four basic effects: (1) an increase in the magnitude of urban settlements beyond all precedent or prediction; (2) the multidirectional spreading of agglomerations along the axes of communication, with uninterrupted ramifications of considerable length; (3) the possibility of inserting scattered or fragmentary residential or industrial developments so long as they remain within the larger area of the communication and transportation network; (4) the expansion of the area of influence or encroachment of the urban center and, in the case of large agglomerations, the expansion of the metropolitan area, within which develop zonal interrelationships entailing a rhythmic flow of persons and goods.

The enormous expansion of the dynamically urbanized territory, within which areas of congestion and dispersion spontaneously formed, soon replaced the closed compact city and the successive extensions (through successive mono- or multidirectional "additions" or concentric-ring radiation) that had for centuries directed its growth. Through the actual breaking up of the compact city, traditional urban space emerged unbalanced and disconnected, either excessively split through disaggregation or excessively consolidated through conglomeration. The traditional plans for extension that survived in some cities at the end of the century dissolved in collision with new dynamic forces because of the lack of any precise idea as to their rational and scientific organization, and the absence of an overt political desire to control and guide the forces involved toward social ends.

The new arrangement of urban space resulting from the internal and external disintegration of the historic city and from its territorial expansion has involved the use of new typological elements in keeping with extreme tendencies to dispersion and concentration. On one hand, there have spread over the land isolated or scattered buildings, or buildings rudimentarily joined in amorphous groupings, which are often inferior in coherence to the most elementary hut groupings of primitive societies; on the other hand, there has arisen the general practice of constructing compact multistoried and towerlike structures, which permit maximum use of building volume. An urban space that is not the result of over-all planning but, rather, the product of a simple summation of the various individual programs, each spatially and temporally distinct and autonomous, cannot present any formal characterization; it occurs instead in an open and receptive form as a continuously variable combination of empty spaces that tend to be filled gradually according to the law of casual succession and as a continuously variable aggregation of filled spaces of different volumes that slowly tend to combine, increasingly thronging together to the point of obstruction. Obviously an urban space of this type, marked by casualness and arbitrariness, can never achieve coherence and a stable combination of elements, regardless of its relative density.

The disaggregation of space causes psychological as well as social and economic consequences. Individual reactions to the lack of spatial cohesion may be repulsion or nonattraction, annoyance or indifference, or even attraction, which may well affect the depths of the psyche and, in any case, cannot fail to influence group psychological behavior and consequently social relationships. Furthermore, crowding, dispersion, and haphazardness inevitably act in a miseducative sense on the development of taste. This is a field of scientific research that awaits adequate exploration, having thus far only been touched upon by the sociometry of Moreno (1953) and the sociological research of Chombart de Lauwe (1952).

The loss of spatial cohesion also entails a reduction in the social utility of the urban built-up area. An excessive thinning out through a decrease in the number of buildings causes a proportionate diminution of human contacts, with a consequent drop in the vitality of social life and a dilution of social services owing to relative disuse. A similar situation is caused by excessive crowding, which, through the massing of building and a corresponding heightening of social tension, provokes a concentration of services in too small an area, creating serious distributional scarcity. Thus the social utility of the built-up area falls short of the average acceptable conditions of individual or collective existence. Furthermore, the atomistic dispersion of commerce and production throughout the metropolitan area, which results from the logic that determines the individual entrepreneur's choice of location, cannot produce a rational and coherent system from the point of view of spatial distribution; it can lead to random and more or less illogical spatial combinations that vary in their aggregate economic utility. Because of this irrationality in the distribution of places of production, storage, and exchange, additional expenses are often incurred in installation, administration, production, and transport. Sim-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

ilarly, both the atomistic dispersion and the massive concentration of dwellings create additional expenses in the installation and administration of public facilities and higher transportation costs for individuals due to the lengthening and multiplication of routes in low-density areas and traffic congestion in high-density areas. Private developers restrict themselves to building dwellings and assume no share of the financial burden of public works, services, or transportation; this expense is left to the local institutions. The results in terms of the quality of urban life lead inevitably to a lowering of efficiency caused by a lack of services and to unforeseen financial expenses that must be transferred to the balance sheets of the local communities as long-term liabilities. Current techniques of economic and town-planning analysis attempt to establish a reasonable balance between long-term social advantages (which may be costly) and short-term profits.

Efforts to correct this situation, which is negative from every point of view, coincide with advances in the modern science of town planning and the difficult problems of practical application. Contemporary town planning endeavors to rediscover and recompose the internal cohesion of urban space with a wide variety of methods and intentions. The following sections will illustrate the various methodological approaches, the results obtained, and the most advanced current trends.

Rediscovery, analysis, and reconstruction of urban space. The slow process of recovering urban space through rediscovery of its constituent elements, as well as the exact specification of methods and principles for a coherent recomposition of space, began with Camillo Sitte's analysis (1889) of the compositional criteria of public urban spaces. The criteria were sought mainly in medieval and Renaissance thinking and were compared with the geometric aridity of contemporaneous gridiron plans for expansion and subdivision. Although Sitte's conclusions (e.g., the outdated appeal for a revival of civic art) are no longer critically acceptable, he opened the way for a rediscovery of historical centers and stimulated discussions on the importance and meaning of greenery in the modern city.

Sitte, Ebenezer Howard, and Patrick Geddes are connected with the school of English town planning represented at the beginning of the 20th century by Sir Raymond Unwin. In *Town Planning in Practice* (1909) Unwin developed Sitte's methods of spatial analysis, extending research to the study of medieval public spaces and their most vital survival, the agricultural village. From these he drew inspiration for a logical and varied spatial composition in the first practical applications of town design: the projects of Letchworth (1903; the first garden city), and Hampstead Garden Suburb (1907), both of which were designed in collaboration with Barry Parker. Unwin's methodological bases for spatial research, founded on direct observation and empirical reasoning, are very representative of English experimentalism. Almost half a century later they reappear, with a modern countenance, as the premise of Frederick Gibberd's *Town Design* (1953).

From Gibberd comes the plan of the New Town of Harlow (1947), one of the first New Towns of the postwar period (construction began 1949; first neighborhood completed 1952). In both his writing and practical experimentation Gibberd develops a theme favored by Unwin — that of spatial composition within groups of low residental dwellings. Gibberd concentrates on the treatment of angles resulting from the articulation of building masses and road insertions, as well as the perspective organization of the complex from the standpoint of a dynamic succession of vistas from the road axis. He applied his research on the composition of Italian Renaissance piazzas (PL. 142) to one of the first modern civic and commercial centers in Harlow. In England, from Unwin to Gibberd, spatial composition was practiced almost exclusively on the rare occasions of *ex novo* creations of cities and districts. These themes were dealt with in a completely different manner from the preindustrial approach to designing, but their prototypes of the 1950s, despite the careful design base and compositional study, still revealed a certain precariousness and lack of characterization that required correction.

From the succinct criticism in this direction by the *Architectural Review* group arose the new doctrine of the townscape. Gordon Cullen (1961) has defined it as an art by which an insignificant cluster of trees or group of buildings can be transformed into a richly significant composition, or by which a whole city can be realized as a three-dimensional environment from a mere design on paper. For Cullen the spatial environment is characterized by its constituent elements (buildings, trees, water, traffic, street furniture, advertising), by their combination, and, above all, by the manipulation of possible patterns that will enable a town to operate with equal success. Townscape is therefore the art of relationships that transforms a group of buildings or an entire city into a dramatic event in the environment. According to Cullen this art is based on the mastery of three elements: (1) serial vision — a deliberate and dynamic unfolding of the town scenery "in a series of jerks or revelations" revealed by turns to the pedestrian in the thoroughfares; (2) awareness of man's personal relationship with the environment (PLS. 138, 139), which permits manipulated space to create a dynamic and continuous plastic experience by such means as the alternation of openings and closings and the alternation of oppression and liberation, obtained through a vast repertory of spatial articulation, including enclaves, enclosures, subdivisions of space, interruptions, fluctuations, undulations, narrows, linkings and joinings, changes of level, focal points, landmarks, exposures, and outlets; (3) content, understood as the emotional meaning of the physical elements constituting the townscape and its fabric (materials, colors, textures; PLS. 140, 141), which in certain combinations and relationships achieve effects of immediacy, individuality, bluntness, vigor, appropriateness, intimacy, illusion, nostalgia, mystery, relief, and so forth.

The choice and manipulation of the various spatial elements, when they are used in the most subtle nuances to obtain the maximum visual effect, can create an urban scene that becomes vibrant with sensations and meanings. This is shown by the fascinating graphic and photographic analyses by Cullen and his school of urban spaces (PL. 143). The subjects are drawn from smaller urban centers that remain uncorrupted by spatial degeneration. The enucleation and analysis of these urban components — which are defined by De Wolfe (1963) as *civilia*, or townscape — not only stimulate learning in the didactic sense but simultaneously lead to a discovery of the profound meaning of the spatial idiom. Even more important, such analysis leads to the consideration of urban space as a composite of all present elements, even the most insignificant, and to a sense of total participation in this space.

Another way of approaching the underlying principle of urban space is linked to the theory on the structure of form (*Gestalttheorie*) and particularly to experiments in Gestalt psychology. Ludwig von Wiese goes back to Gestalt experiments and theory in his studies of the behavior of inhabitants of a neighborhood or agglomeration. Spatial connections, density, and social distance determine a common *Gestaltschau*, or structural vision, which affects interpersonal relationships and thus determines behavior. Sociological research in this field has been summarized by Gregor Paulsson (1959). The strictly visual aspects of urban *Gestaltschau* have been the object of experimental research by Kevin Lynch (1960), carried out with a methodology that differs profoundly from that of Cullen in purpose and field of exploration. Lynch's research does not examine spatial components of high and tested emotional potential but investigates typical elements of the urban townscape in contemporary North American cities; these elements are obviously damaged by spatial incoherence and separation. Nor is Lynch's research directed toward examination of psychological reactions to the environment by inhabitants or visitors; it aims solely at identifying the structure of the urban form as it is ordinarily accepted. The city can be considered an "artifact" only through long periods of time and through repeated experimentation in which each urban element is placed in relationship to its surroundings, to the preceding sequence of events, to the memory of preceding experiences, and to the associations that every citizen has with each element, so that it is charged with sym-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

bolic meanings. At this point, an attempt can be made to objectify and to extract from these experiences the citizens' "public" image of the city.

Once it has been ascertained that an organized urban environment can act as a broad system of reference and that every environmental image has a social function in affording raw material for the symbols and collective memories of group communication, a further point can be made. Certain objects possess a high potential for evoking a strong image; this is called "imageability." In any given urban environment the strong and the weak points of the image can be identified. Among the strong points are individuality, simplicity of form, continuity, dominance, visibility of joints or seams (as in a major intersection), and directional differentiation; among the weak points of the image are confusion, isolation, discontinuity, ambiguity, and lack of character. Through research on the channels of observation, on the margins, on the districts considered internally characterized, on the accessible focal points of interest, and on the landmarks or inaccessible symbolic points, it is possible to construct a "visual plan" that corresponds to the observer's mental image of a given environment. Investigation of a wide sample ensures the validity of the visual plan as a group image (PL. 142).

Once visual plans have been constructed, critical analysis (according to Lynch) can be applied to the suitable creative decisions for scientifically reorganizing the mental image of the city. Though Lynch proposes to transform even the great contemporary city by replacing the fear and confusion it inspires with "delight in the richness and power of the scene" (ibid., p. 119), he offers no operative suggestions and limits himself in his subsequent study (1962) to developing the theme of the complete spatial organization of the smallest possible residential group. The spatial reorganization of the large city eludes Lynch's formulations.

The method for the integral recomposition of urban space does not and cannot emerge from interpretative research on urban space. The complex socioeconomic structure of the urban reality can be substantially modified only by means of controlling the socioeconomic factors themselves, which to a varying extent generate the space. But from the more recent experiments of Lynch and Cullen, as well as those of Moreno and Chombart de Lauwe, there emerges a new, more complex, and richer way of conceiving urban space that demands thorough examination by means of an interdisciplinary integration of all research. A particularly illuminating exploration could derive from an exhaustive historical-epistemological interpretation of correlations between the scientific concept of space and the concept of urban space implied in concrete urban creations at different historical periods and in different countries.

Albert Einstein, in his introduction to a book by Max Jammer (*Concepts of Space: The History of Theories of Space in Physics*, Cambridge, Mass., 1954), outlined two opposing concepts of space: "(*a*) space as positional quality of the world of material objects; (*b*) space as container of all material objects." The former appears in the Greek and medieval conceptions of urban space, which are based on the juxtaposition of elements; the latter appears in the *ratio mathematica* of Renaissance space. The attempt to reconcile the geometric (*a*) and kinematic (*b*) interpretations of space by introducing the system of Cartesian coordinates as well as the Galilean and Newtonian conceptions, all of which develop and enrich the independent and absolute concept (*b*) of space, finds broad correspondence in the baroque spatial conception, which in certain experimentations partakes of the same speculative research. The victory over the concept of absolute space or over that of the inertial system was made possible by the substitution of the concept of the field over the concept of the material object. This, according to Einstein, has permitted the representation of the whole of physical reality "as a field whose components depend on four space-time parameters. If the laws of this field are in general covariant, that is, are not dependent on a particular choice of coordinate system, then the introduction of an independent (absolute) space is no longer necessary. That which constitutes the spatial character of reality is then simply the four-dimensionality of the field." These ideas are to some extent reflected in the conception and intepretation of urban space, and not only of architectural space. The clinging of spatial uniqueness to events, the kinematic use of space, and even its interpretation as a frame of reference for the collective memory are also made possible by the new time-space conception. Further insights into the magical and symbolic meanings of urban space should produce a wealth of interpretations, leading a complete reevaluation of the significance of archaic emotional reminiscences (whether individual or collective), underlying spatial perceptions and to more systematic research upon their emergence in the course of experiments in spatial organization.

It can therefore be concluded that modern urban space is a multidimensional synthesis, with geometric components as the simple support of complex conceptual and emotional meanings. These meanings contain what has remained of historical and archaic experience and what is being added by experimentation and scientific speculation. The organized recomposition of contemporary urban-space concepts must necessarily take into account this complexity; validity will be measurable in the quality and quantity of meanings and experience within this recomposition and by the degree of their collective comprehension, fruition, and communication.

MODERN UTOPIAS. The formation of the modern science of town planning was preceded by a utopian phase that extended from the end of the 18th century to the beginning of the 20th century. This phase was characterized by attempts to invent a city of the future that would be capable of expressing a new society. Through these artificial constructions there reemerged the same Neoplatonic current of thought (although with different hypotheses) that produced the community utopias described by 16th- and 17th-century social reformers and the models of ideal cities designed and illustrated by Renaissance urbanist architects. Utopias appear both in descriptions by modern social reformers, who not only propose models for society but also give indications concerning the spatial characterization of the urban models, and in projects by contemporary urbanist architects, who contribute to the spatial characterization of models requested by the social reformers, or who independently propose theoretical urban models with or without the support of a hypothesis for reforming society.

Like their Renaissance counterparts and, in fact, like all imaginary idealized societies and their urban models, modern utopias are presented as perfect schemes for the solution of all present-day urban and social evils. As Toynbee points out (1934), these descriptions and models presuppose a crystallization of society itself and are therefore static, born *ex hypothesi*. According to Mumford (1922), they can be divided into two groups. The first comprises utopias of escape, which aspire to immediate liberation from present frustrations and correspond to a primitive way of thinking, according to which one dreams of the gratification of desires without taking into account the actual restrictive conditions. Such societies therefore assume the characteristics of fugue or compensation. The second group comprises utopias of reconstruction. These attempt to provide the conditions for a future liberation. Despite the dangers and limitations of their static nature, such utopias offer stimulating elements for improved social arrangements, anticipation of possible future solutions to problems, and a course of action.

Just as some of the legal and technological aspects of More's utopia have been incorporated, if only marginally, into later societies, so some predictions of the utopias of reconstruction will become social and technological reality; but undoubtedly the coherence of the system will be lost. The failure of utopias is inevitable, from both a theoretical and a practical point of view. Complete substitution of one society for another is impossible, as is the crystallization of any given system. This does not diminish the fascination of utopias, especially when they avoid the characteristics of escape. A utopia may assume the value of a work of art or of a scientific, moral, and sociological work. Utopian creations recur in the history of civilization and appear primarily in periods of decline or transition, when profound changes in the social structure appear most necessary.

During the great flowering of utopian writers there appeared

works by Thomas Spence (1795), H. G. Wells (1905), and a group known as the associationists; the last achieved particular fame for their transposition of the social utopia into ideal urban models. Their proposals for new social structures were based on a community of goods for productive purposes and on rules of association, to which were attributed special powers of attraction and liberation. Among these men were the Saint-Simon socialists Owen and Fourier at the beginning of the 19th century; then Buckingham and Cabet in the middle of the century; and Bellamy and Howard at the end (PL. 145). François Marie Charles Fourier (1772–1827) did not propose to modify human nature but, rather, to understand it in order to allow the original nature of man to act freely. He based his sociology on the forces of "attraction" for the creation of "harmonious associations." Fourier's system (1808; 1829) rejected a society founded on the imperfect and immoral competition of individual interests, to which he opposed the cooperative principle of joint effort in order to attain a state of universal harmony. His "phalanstery" was the dwelling unit of a "phalanx" (a community of 1,620 members), and his description recalls the Louvre, a communal palace.

Robert Owen (1771–1858) experimented at the beginning of the century with certain improvements in the economic and social treatment of employees in the New Lanark spinning mills. In 1816 he introduced in New Lanark one of the first modern community institutions for the education of children. Thereafter he advocated the creation of small cooperative industrial communities of 1,200 persons, which were to be established in rural settings, as a remedy for pauperism, and as a system for ensuring advantageous employment for all workers and for allowing unlimited mechanical progress.

Owen's urban model does not differ substantially from the rural industrial colonies established by enlightened industrialists in the northern countries during the 17th and 18th centuries. Furnished with collective and public-service buildings, the colonies were surrounded by fields cultivated in common. Numerous late-19th-century model industrial colonies, conceived along more or less communal lines, were related to these trends. Among the best known were Saltaire (PL. 145), founded by Titus Salt in 1853 for the processing of alpaca wool, and the *familistère* founded by Jean Baptiste André Godin at Guise (PL. 145), the residential and commercial center of a cooperative ironworks with about 400 families. The installations of the *familistère* are still in existence and represent, in the opinion of Benevolo (1963), the happiest experiment of all those attempted in the 19th century by the theoreticians of socialism. Bournville was founded in 1879 by G. Cadbury for a chocolate factory, but the community was limited to workmen's dwellings. Port Sunlight was founded in 1886 by W. H. Lever for his soap industry, and Kronenberg was established in 1873 by the Krupp Works of Essen.

With James Buckingham (1786–1855) and Etienne Cabet (1788–1856) there arose a renewed interest in the general idea of model industrial communities. Buckingham (1849) hypothesized the complete city of Victoria with no more than 10,000 inhabitants, technically advanced and entirely inhabited by shareholders in the common property who subscribed to a series of internal laws. This city represented "the ideal *bourgeoisie*," according to Mumford, and contained the seeds of the garden-city principles later developed by Ebenezer Howard. Etienne Cabet (1840) described a large rational metropolis inserted within a social system based on obligatory work, progressive taxation, old-age pensions, and division of the industrial product. In an attempt to carry out his theories, Cabet in 1848 led an expedition of 1,500 Icarians to Texas, where unforeseen difficulties compelled him to establish small and separate rural communities; the experiment died out after a few decades. Edward Bellamy (1850–98), in *Looking Backward: 2000–1887* (1888), described an imaginary society in A.D. 2000 based on cooperation and productive activity organized by an industrial army.

The century closed with the planned urban utopia illustrated by Ebenezer Howard (1850–1928) in *Tomorrow, a Peaceful Path to Real Reform* (1898; FIG. 221) and further developed by him in *Garden Cities of Tomorrow* (1902). Howard's work represents

a synthesis of various associationist utopias; its great originality consists in the emphasis placed on town planning as an instrument for the elimination of present urban evils and for the support of a better society. With Howard the process of translating the ideal of social utopia into a planned urban model was inverted; the urban model was conceived as a whole composed of principles, norms, and methods preceding and facilitating social reform. Beginning with the postulate that the massing of populations in large crowded cities is harmful, Howard compared the attractions of the city and those of the country in his diagram of the "three magnets." The urban magnet attracts through work possibilities, high salaries (despite higher cost of living), entertainment, exchange, and public facilities; the disadvantages are isolation in the crowd and an unhealthy milieu. The attractions of the country lie in the beauties of nature and the pure air and healthier environment; these are counterbalanced by monotony, lack of company, low salaries, and general cultural decline. Utilization of the attractions of both to maximum advantage can be obtained, according to Howard, by a third solution — the city in the country, which he calls the garden city. He specifies its dimensions: The population is limited to 30,000 inhabitants over an area of 1,000 acres for the central city and 5,000 acres of agricultural land with 2,000 inhabitants surrounding the nucleus. Howard also analyzes in detail the costs of establishing his city. Its essential characteristics consist less in the scheme and dimensions of the autonomous urban complex, complete with industries and services, and more in the combination of norms and procedures for establishment and administration. These procedures are conceived so as to remove initiative from every possibility of profit on building sites and to guarantee common control of the various phases of execution. Howard's scheme is therefore essentially operative. His plan is based upon the force of impact of the proposals as a whole, which, according to his disciple and follower Frederick Osborn (1946), comprise (1) the planned decentralization of industries and populations from overcrowded metropolises to garden cities; (2) limitation of the city within a preestablished boundary in order to guarantee balanced services; (3) amenity of site and layout; (4) exchanges between the city and the country; (5) control of the planning of the entire system, of the means of communication, of the subdivision into functional zones, of the limitation of density, of the types and uses of the buildings, and of the establishment and the distribution of green areas; (6) subdivision into districts or neighborhoods; (7) land ownership in the name of a nonprofit company that leases out the sites for building purposes for a limited time (99, 198, or 999 years); and (8) municipal and cooperative enterprises.

Howard's scheme was immediately successful because of its practicability down to the smallest detail and possibly because of its implicit renunciation of basic reforms in the economic and social structure. In 1899 the Garden City Association was founded in London; in 1901 Ralph Neville became its president. In 1903, with the acquisition of land for Letchworth, the original Garden City Company Ltd. was created and registered as a nonprofit joint-stock company. Financial difficulties slowed down the construction of Letchworth for decades, and it was only in 1961 that it reached approximately the anticipated population.

The principle of repetition was inherent in Howard's idea. Thus the garden-city experiment was repeated, this time with greater inventiveness, in 1920 at Welwyn, which was constructed on a project by Louis de Soissons. It was necessary, however, to wait until the resumption of construction after World War II for the idea of the garden city to find broader application in the plan for the metroplitan area of Greater London drawn up by Leslie Patrick Abercrombie (FIG. 225). The idea was then brought up to date through a revision of its dimensions and program. Having shed its shareholding aspects, it became, with the New Towns Act of 1947, one of the key elements in the English policy of planned decentralization on a national scale in the 1950s. Thus the planned urban utopia of Howard was the only one among the theoretical systems of the 19th century to become a reality and to have demonstrated sufficient

flexibility to meet the requirements of planned development on a large scale.

Contemporaneous with the birth of the first garden city was the conception of Tony Garnier's *une cité industrielle* (1901–04; pub. 1918). Whereas Howard expounded a method of building modern and autonomous cities of limited dimensions that were a modern interpretation of the medieval urban complex, Tony Garnier came face to face with the question of a large industrial city (PL. 146) totally rooted in the present and entirely turned toward the future, which would furthermore be built in a single operation in a given location. Howard had given a detailed account of costs and procedures in order to gain acceptance for his idea; but Garnier presented a complete city project, designed and planned as a whole and in the constituent parts — industries, public services, and dwellings — down to the details of construction with a systematic application of the new technique of reinforced concrete, to which he himself made a substantial contribution. The complete project has a clarity and fascination that makes it an unequaled *tour de force* of planning and invention. Garnier's technological anticipations, such as his prevision of the development of the automobile and aeronautic industries and the rational organization of industrial zones, were to be widely confirmed in fact, and his scheme was to become an ideal model for the creation of new industrial cities in the Soviet Union during the 1930s.

With Garnier the planned utopia changed course, as it was he more than Howard who opened the way to experimentation in projects. But for this, Garnier paid the price of total disavowal of contemporary reforms in the social structure. His planned utopia was divided into two distinct components: design and policy. The design became neutral, as it was in the infrastructural approach of the end of the 19th century. The abundance of projects resulting from this dissociation of design and policy, which found maximum expression in the work of Le Corbusier and extensive application in the work of the rationalists of the 1930s, was accompanied by a weakening of the ideals and policies of the designers, which contributed to a slowing down of the very process of planning. Thus the more modest but actually more efficacious ideas of Howard ultimately showed far grater continuity and proved more prolific.

After Garnier there are few modern utopians of stature in the field of town planning. Of major importance are Le Corbusier (q.v.; see also EUROPEAN MODERN MOVEMENTS) and Frank Lloyd Wright (q.v.); of somewhat lesser importance are Walter Gropius (q.v.) and Ludwig Hilberseimer. Among Le Corbusier's contributions to town planning are his proposals for the project *Une ville contemporaine de 3 millions d'habitants*, presented in 1922 at the Salon d'Automne; his Plan Voisin for Paris (PL. 146), presented in 1925 in the Pavillon de l'Esprit Nouveau at the Paris Exposition des Arts Décoratifs; and his commentary on the Ville Radieuse, which appeared in 10 installments between 1930 and 1931 in the review *Plans*. All three works, but principally the first, contain the whole of Le Corbusier's theory of the city of the future. This city, in contrast to the garden city, is conceived as a large human concentration primarily engaged in activities to which the inhabitants have a personal dedication. The inhabitants occupy a limited series of skyscrapers, each capable of housing 10,000 to 50,000 people and widely separated by green belts. The city is structured with an uncomplicated network of roads, which are levated so as to separate automobile traffic from pedestrian traffic on the ground-level paths.

Later applications of Le Corbusier's theory (e.g., Algiers, 1930; Antwerp, 1935; Rio de Janeiro, 1936; Buenos Aires, 1938; Saint-Dié, 1945) confirmed its validity, while his untiring publication constantly drew attention to his ideas. These ideas, which long predominated in various movements for the renewal of modern architecture, were finally tested in the *unité d'habitation* in Marseilles (I, PL. 388; IX, PL. 107) and, above all, in the project for Chandigarh in the Punjab (PL. 172; VII, FIG. 899; IX, PL. 108). In Chandigarh, however, his glass cruciform towers, or "Cartesian skyscrapers" (IX, PL. 106), for office use were replaced by a legislative and administrative center, and the 10-story residential towers (*maisons à redents*) of the *ville contemporaine* were reduced to neighborhoods not dissimilar to those of the garden city, to which the architect was once strongly opposed. Nevertheless, Le Corbusier's efforts in the field of town planning will always remain one of the liveliest and most fertile manifestations of creativity along utopian lines.

Broadacre City, Frank Loyd Wright's ideal city, has very different characteristics. It is based on the replacement of the centralized concentrated city by an agricultural-urban continuum structured by giant roads that "unite and separate — separate and unite the series of diversified units, the farm units, the factory units, the roadside markets, the garden schools, the dwelling places (each on its acre of individually adorned and cultivated ground), the places for pleasure and leisure. All of these units so arranged and so integrated that each citizen of the future will have all forms of production, distribution, self-improvement, enjoyment, within a radius of a hundred and fifty miles of his home. . . ." (1932). Broadacre City represents both the antithesis of the *ville contemporaine* and the spatial dissolution of the garden city. It continues to exert a fascination for its excellent manipulation of completely urbanized space (PL. 147).

In this conceptual picture are included the contributions of Walter Gropius and Ludwig Hilberseimer. Gropius, in the dispute over the height of houses, intervened in favor of taller structures. In 1927 Hilberseimer (FIG. 221) theorized the multilevel circulation system in large cities and later embraced the thesis of the horizontal city, from which he developed residential elements and comprehensive schemes (1944). By the 1930s rationalistic architecture had reached full development, and the first experimentations in the construction of rationalist complexes were being carried out (PL. 147). In 1934 the elaboration of the new plan of Amsterdam was completed, which definitively made town planning a dynamic and functioning reality. A new methodology in the field — that of scientific planning — was taking the place of the utopias. The attraction of utopianism has reemerged from time to time, as in the hypothetical plan for the linear expansion of Tokyo by Kenzō Tange (PL. 147; see ORIENTAL MODERN MOVEMENTS) and the fantasies of the Metabolists (FIG. 221), which take the form of figural exercises; however, its historic function is clearly exhausted.

URBAN PLANNING. *The rationalist experiment and the plan of Amsterdam.* In the decade from 1925 to 1935 the science of town planning was fully developed conceptually. But instead of moving toward a synthesis of the research and experimentation from which it had derived, town planning continued to maintain its various original characterizations. Thus, by turns, it was linked with geography, history, and ecology; it was illuminated with utopian messages; it became a symbol of architectural renewal; or it entered into didactics as an example of the application of modern technology. During the first decades of the 20th century town planning still had these characteristics in some degree, although in a confused manner; in the field of practical experimentation it oscillated between opposite tendencies. The organic current came to North America (after Howard and the English experiments) through Lewis Mumford, Clarence Stein, and Henry Wright. In 1928 Stein and Wright executed the magnificent experiment of Radburn, on which were modeled the Greenbelt Towns (1935–42) within the framework of President Franklin D. Roosevelt's New Deal policy. In Central Europe, between 1925 and 1930, success accompanied the efforts within the rationalist current, which derived its principles from Tony Garnier and Le Corbusier. This new idea was realized in Rotterdam in 1925 with the Kiefhoek district by Jacobus Johannes Pieter Oud (q.v.; PL. 148; V, PL. 106); in Frankfurt am Main between 1926 and 1928 with the projects of Ernst May; in Stuttgart at the 1927 fair, which exhibited architectural experiments; in the residential housing built on plans by Walter Gropius (Törten, in Dessau, 1926–27; Dammerstock, in Karlsruhe, 1929, PL. 148; the Siemensstadt housing estate, in Berlin, 1930), and in the first Russian experiments along these lines between 1929 and 1932.

The aims and methods of the organicists and the rationalists

were profoundly divergent. The former proposed to develop ideas involving a synthesis of various functional, environmental, and sociological elements. The latter sought primarily an objective efficiency in the planned urban establishment in terms of exposure to sunlight (insofar as it could be quantitatively measured) and therefore of orientation and distances between the buildings; or in terms of clear differentiation as to land use and therefore of specialized zoning for the fundamental functions of residence, work, traffic, and recreation. According to the rationalist trend the important objectives were "classer, typifier, fixer la cellule at ses elements" (Le Corbusier).

The transition from Le Corbusier's basic cell to the city should be made through successive aggregations. The repetition of the cell produces the cluster, and the repetition of identical clusters produces an equalitarian residential neighborhood. According to this logic the multiplication of the basic neighborhood should produce identical and "rational" living conditions for all the inhabitants of a city. Faith in the technological miracle was never questioned, and through the same logical process a technical solution to all problems was sought — from the state of the roads, for which expensive technical solutions were advanced owing to the increasing use of motor vehicles in those years, to the sun exposure of buildings. Norms were sought to guarantee equal conditions for all (Rey et al., 1928).

It was naïve to expect, however, that urban unity, by definition complex, could be created automatically through manipulation of the basic cell. The example of Frankfurt am Main between 1926 and 1930, where the expansion plan by districts was socially significant, proved the impossibility of achieving an integrated whole by this method. The criticism of the organicists regarding the fragmentariness of the rationalist trend was therefore well founded. For the rationalists to achieve comprehensive results it was necessary for them to change their methods. The opportunity presented itself with studies for the new plan of Amsterdam, begun in 1928 and terminated in 1935. In these studies all the individually conducted research and experiments of the rationalists converged. More important, there was formulated a method of work that, through clear specification of objectives and efficient organization of working groups (led by Lohuisen, Van Eesteren, and Scheffer, who were responsible for research, design, and coordination respectively), permitted the establishment of new general guidelines for all problems created by a large developing city.

Apart from its over-all unitary vision of the city, there were three major conceptual and methodological innovations of the Amsterdam plan that can be subsumed under the heading of "master planning." (1) The temporal projection of the plan to the year 2000 made it possible to overcome the shortsighted hypotheses of traditional extension plans (which lack an over-all chronological perspective), while avoiding the vagueness of undated plans. (2) The plan was comprehensive — that is, it considered all the component elements of the city from the point of view of dimensions and distribution in terms of ascertained present and future needs. (3) The execution of the plan was conceived as the sum of successive operations, which were to be coordinated in time and space, with arrangements made for their scheduled performance.

With this new conceptual formulation that incorporated the unitary view of the organicists, the fragmentary quality implicit in the rationalist experiments was overcome. Furthermore, the dictum of Howard (amply confirmed by Mumford) regarding the necessary rejection of the existing city was also eliminated. Because of these innovations and the dynamic workability of the plan, it suddenly stood apart from all previous practice in technique and civic design. That it developed in Amsterdam was no accident; for Amsterdam was a city that for more than three centuries had kept alive the planning tradition and had traditionally accepted precautionary preparation of land as a public operation — a procedure necessitated by the local geotechnical characteristics.

Unfortunately, the example of Amsterdam did not produce immediate effects in theoretical development or in the diffusion of the new doctrine. Repressive regimes and the outbreak of World War II ended town-planning studies for a decade throughout Europe, with the exception of England and the Scandinavian countries. After the war, with new requirements of reconstruction and a climate of hope, the new planning concepts resumed their development.

A new conception. With the revival of production and building in the 1950s there was a rapid and unexpected flourishing of plans. Town planning seemed suddenly free of the cultural limitations and obstacles of the rationalist schematisms, the utopian aspirations, and the engineering technique of the thirties; having assimilated the methodological lesson of Amsterdam, urban planners faced the test of reconstruction and reorganization on an urban and regional scale. In 1944 Patrick Abercrombie prepared the plan for Greater London (PL. 147; FIG. 225). A series of laws relating to town planning (Town and Country Planning Act, 1944; Distribution of Industry Act, 1945; New Towns Act, 1946; Town and Country Planning Act, 1947) institutionalized the control and intervention of town planning at the various administrative levels and in the various sectors, thus offering the prospect of a coordinated and continuous planning policy within the entire territory. In Sweden the general plan of Stockholm (FIG. 225) was placed under study in 1945, and in 1948 a new town-planning law was passed. In Holland, where the tradition of municipal urban planning had long been consolidated, planning at the national and regional level was established. In Poland the dramatic problems of reconstruction were immediately faced in accordance with a farseeing planning philosophy. In France the first proposals in regional planning were also encouraged, as was planned reconstruction and the building of new districts. At almost the same time, studies in town planning were begun or resumed in Denmark, Norway, Finland, Austria, Belgium, and Yugoslavia; discrepancies in time and manner of town planning in these countries were caused more by the degree of cultural and political maturity than by actual physical requirements, which were present and urgent everywhere. Studies in town planning were also officially begun in Italy, West Germany, Spain, and Portugal.

In the United States, in the 1950s, an impressive project of urban renewal was begun in Philadelphia with much publicity (PLS. 151, 177). Studies for the redevelopment of various cities and the economic development of certain watersheds were undertaken. In the U.S.S.R., as soon as the difficult living conditions of the early postwar period had been adjusted, plans were formulated for city reconstruction and extension and for the establishment of new cities and centers of production. Several new cities were designed in other parts of the world. Urban plans for metropolitan areas were proposed for the large, expanding cities of Tokyo (PL. 147), Lima, São Paulo, Buenos Aires, and Sydney. In the underdeveloped countries the first plans for stimulating economic development were from the start coupled with plans for infrastructural and urban development.

Once the universal diffusion of town-planning methods had occurred, it was not long, however, before great disappointment appeared everywhere concerning the effectiveness of the mechanism that had been set in motion with such speed and confidence. It was apparent that complete or even satisfactory control of urban growth in the large cities was not being achieved through urban planning. The operations anticipated by the plans were either not carried out or were often carried out in a disconnected manner. In the worst cases (in Italy, South America, and the Middle East) the plans proved to be almost ineffectual. Either their norms were violated with impunity by the public bodies even before private individuals could do so; or, if these norms were respected, they did not produce appreciable results in the development and shaping of areas or in the protection and revitalization of historic centers. Even where town-planning ideals, technical traditions, and political education were most advanced (as in the Scandinavian countries, France, and West Germany), the realization of the plans seldom went beyond some isolated instances of good or excellent accomplishments in residential districts, in new business or administrative centers, or in important infrastructural works,

such as urban expressways. Too often there was a lack of space-and-time coordination and of an over-all view of the city in its development. The only exceptions were a few isolated and exemplary experiments in Holland and England.

The causes of this operative inefficiency in the urban planning of the 1950s cannot be attributed simply to technical errors in planning or to the inevitable defects of a still crude and imperfect mechanism. They must be sought in a conceptual deficiency inherent in design, which revealed itself in the vagueness of goals, time limits, and costs and in the inadequacy of the means to the ends — or more precisely, in the inability to discern or accept the most suitable means for the desired ends; in short, there was an absence of sufficient investigation and consequently a lack of choice. It is now apparent that urban planning in the 1950s rested upon uncertain theoretical foundations. These foundations were unsystematized and too weakly explored; with rare exceptions, a solid cultural and didactic tradition had not yet taken shape, and planning was hazardously based on conventional, empirical manipulation. Furthermore, at that time political choices as to the control of economic programs had not yet been made, except in Holland and in England under her first postwar Labor government.

Early errors in town planning have been remedied only where there has been an attempt to integrate urban planning into economic planning, as in Poland and Yugoslavia. Wherever there have occurred coordinated attempts to rationalize and reorganize the processes of economic development and urban planning, there have been conceptual and political advances in the latter field. In other instances the attempts at urban planning have too often revealed too much dilettantism, and the technical and juridical means have displayed their inefficacy in unsatisfactory results.

From technical town planning to continuous creative planning. The two main conceptions of town planning that have emerged from the experiences of the 1950s are technical town planning and continuous creative planning. There are substantial differences between them. Technical town planning includes the following four points: (1) The plan is conceived for an indefinite period without any specification as to the phases of execution; or, if these are hypothesized, without any formulation regarding the most efficient operative tools. (2) The plan functions essentially through a combination of restrictions and incentives. Restrictions occur where limitations, total or partial, are placed upon the use of the land; incentives occur where the transformation of use is encouraged. Restrictions and incentives are translated technically and juridically into zoning ordinances, which consist primarily in the physical relationship between the area and the constructed volume. (3) Control of economic activity occurs only in an indirect way and is limited to the application of the local zoning ordinances. (4) Execution of the plan is left to the free play of individual private or public initiative, the only condition being respect for the local zoning ordinances. Coordination in space and time of private and public initiative is not considered in this type of plan.

According to the logic of this system, urban planning manifests itself essentially in the formation, approval, and application of the plan; it is therefore mere technique. The plan is conceived statically and abstractly — that is, free from the process of existing or ongoing development and from temporal goals. The vision of the future is projected forward to a distant and unspecified date when all parts of the plan will be executed; at that time the proper dimension of the city will have been achieved, and there will be a dimensional and spatial balance among the individual parts. While the city awaits the achievement of its proper dimension and balance, a complex of private and public initiative develops within the categories of the zoning ordinances. (These ordinances may cover commercial, industrial, manufacturing, and residential land use; or bulk, density, sanitation, etc.). The choice of a specific site for a given structure may be of no importance to a planner operating within this conceptual framework so long as a zoning ordinance is not violated. The plan is conceived as a large reservoir with many compartments (zones), and they are gradually filled in one way or another until the whole is complete. This lack of interest in the phases of execution allows great freedom to individual initiative for residential or industrial sites or for public and private amenities. But it does not permit intermediate phases of spatial and dimensional balance. It is therefore inevitable that during execution a general lack of balance occurs among all the urban elements in their reciprocal relationship (e.g., among manufacturing sites, residential areas, and public services), as well as a specific lack of balance in each (e.g., residential areas without adequate services). The very logic of this approach leads to a conception of the plan as a sum of possible initiatives rather than a complex of operations to be carried out. The undefined projection into the future and the indefinite scope of possible future initiative thus widen the very dimensions of the plan; they inevitably lead to an overpermissiveness concerning the dynamics of development and very often to a simultaneous underspecification of the amenities, especially when the private initiative of builders becomes predominant.

This type of plan, which readily accepts the free development of individual initiative, requires only a technical system of regulations and not a spatial-temporal coordination of private builders. Local zoning ordinances provide legal physical limits, but spatial distribution still follows the logic of marginal development, resulting in additional expense in infrastructural costs and negative results in the formation of the urban space. From the standpoint of execution this type of plan can also be defined as a plan for regulated marginal expansion. Conflicts between public and private initiative are inevitable. Public initiative, not being coordinated, tends to be subdivided into sectors of intervention subject to various state and local authorities; this opens the way to internal contradictions and collisions with private initiative. In such a tangle of conflicts the more powerful economic interests in the particular site eventually gain predominance. The plan itself cannot avoid being influenced by this in its formation, in its wait for approval, and during its execution. If these economic interests are ignored, the plan is overwhelmed by them; if they are satisfied, the plan is dominated by them. In the most fortunate cases the plan reconciles competing interests.

Many plans of this sort have been produced in various countries: in England before 1943, in South America in the immediate postwar period, in Italy in the 1950s. The critical examination of results led in some countries (first England, then Poland) to a profound conceptual and operative transformation in planning that considered the already tested Dutch experiment. The extreme limit of aberration reached by technical town planning is illustrated in the zoning plan for Genoa, approved in 1959. Its residential areas were zoned to guarantee, through extension and constructed volume, a density of 7.5 million inhabitants, compared with the then-current 850,000, with no corresponding specifications for areas of productive activity or amenities and with no foundation in hypotheses pertaining to economic-demographic development.

Even situations less paradoxical than that of Genoa have in some cases led to significant planning revisions. In Hamburg, for example, the original plan of 1950 was replaced in 1960 by a new one (PL. 152) directed toward (1) elimination of residences from the central city, which was intended exclusively for administrative activities; (2) elimination of the high density of the internal residential areas and the too-low density of the suburbs, with an analytical revision of zoning ordinances for each residential area; and (3) compulsory submission of detailed plans of construction, land use, land coverage, amenities, density estimates, and the like, for every portion of the territory. The pyramidal city of the 1950 plan, with density decreasing from the center to the suburbs, was replaced in the 1960 plan by a homogeneous urban development distributed fanwise around the administrative center of the city and by an operative planning process in space and time. With these innovations the 1960 plan for Hamburg was fundamentally converted to the principles of the Amsterdam experiment.

The second main conception of town planning in the present day is continuous creative planning, which includes the following conceptual and operative elements: (1) The choices and general

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

planning decisions are consistent with the existing process of development, its intrinsic susceptibilities to economic and demographic enlargement, and the possibilities of transforming its components for more productive cooperation. (2) Decisions both general and specific concerning the use of space are cognizant of the changing situation with the passage of time and are made consistent with present economic-demographic development and hypothetical future development. (3) The plans are conceived in operative form for the attainment of definite aims and are articulated in long-term, medium-term, and short-term plans. (4) The efficacy of the plans is ensured primarily by acts of direct administrative intervention. Public intervention has priority over private intervention, although the latter is not excluded and is guided by public intervention. (5) Choices in spatial distribution are submitted to *ex ante* analyses and testing. (6) Urban planning in each of its phases is consistent with economic planning and programs.

According to the logic of this system, the plan (rather, the succession of plans) is purely instrumental with regard to the process of analysis, choice, and test. The city, territory, or region subject to planning is always the object of an over-all vision, both in future projections and in each stage of execution in medium- or short-term periods. The search for spatial equilibrium is constant, and the individual stages of execution present themselves as states of equilibrium in the process of planned development. The concept of the final perfect state implicit in the abstract technical plan is thus replaced by a succession of developmental stages.

The plan of any one stage no longer has the form of a sum and synthesis of transformations and possible initiatives but is composed of the entirety of operations to be carried out. Medium- and short-term plans assume an eminently operative character. In short-term periods (assuming efficient planning has overcome the developmental phases) the plan of execution combines all the operations — and only those — decided upon for execution. The definition of long-, medium-, and short-term periods in this projection acquires decisive procedural value. Adherence to reality and unforeseen events and the resolution of possible discrepancies between plan and execution are guaranteed by periodic revision of long-term plans and by the flexibility of short- and medium-term plans; the planning thus becomes "continuous."

The general technical lines of the plans in this kind of mechanism can much more easily follow a scientific methodology in the search for optimum solutions, since continuous creative planning is free from the pressures of conflicting interests present in abstract technical plans. Because execution occurs through a series of plans, it can be technically foreseen in small detail; it is therefore possible to guarantee the creation of a human and efficient urban space and to calculate the cost of development before and after execution. Thus the process of execution becomes rationally controllable, and the experiments carried out can be illuminating for future decisions from the standpoint of efficiency and cost. So contrived, urban planning can aspire to effectuate a profound structural transformation of existing cities and regions. It can aid in solving hitherto unsolved problems concerning optimum use of public investments and spatial distribution of economic activities. Urban planning opens the way to a new spatial modeling which can be critically evaluated and economically verified and which remains alien to naïve utopianism and to the degeneration of spatial disintegration and congestion, all of which result from passive acceptance of conflicting urban forces.

According to this new logic, planning becomes essentially a creative and driving force for economic, social, and urban development. Urban planning has been oriented in this direction, in a fairly integral and coherent manner, in Holland, partially in England and Scandinavia, and more fully in Poland and other socialist countries. In Holland, planning at the local, regional, and national levels is now closely connected with economic planning, and both the general and detailed plans also function satisfactorily in planning for rural areas. In two decades rural areas and agricultural enterprises have been almost entirely redeveloped.

In England, town and country planning has made enormous progress in the control of land use and its transformation, in the control of sites for all industrial establishments, and in the organization of planning authorities. Fifteen new cities were established between 1946 and 1956, and development plans for entire regions are continually under study. In Scandinavia, now that the first stage of fragmentary and espisodic planning has been surpassed, foundations are being laid for coherent comprehensive planning. The most mature and advanced forms of continuous creative planning, however, appear in Poland in the skillful linking of long-, medium-, and short-term plans and in the methodological formulation of the plans directed toward the econometric evaluation of optimum solutions through the comparison of alternative solutions. From these experiments it seems possible to extract outlines for a town-planning discipline that permits solution of the increasingly complex spatial problems of the present.

The friction between conventional technical expedients and continuous urban planning corresponds exactly to the conflict between marginal and structural reforms, which in economics, politics, and sociology differentiate two dissimilar approaches and conceptions of present and future. "The classical tendency of economics," claims Henri Janne (*Les problèmes de la planification*, 1962), "consists in the projection of the present into the future; for what is known in the present is considered an indication of what is to come. This manner of thinking therefore tends to prolong the present into the future. In planning, however, the present is already shaped in terms of a representation of the future. It is a system of creative foresight. The predicted future, which is bound to materialize, settles into the present with its powerful potential of fulfillment, and thus changes the significance of the present as well."

Identical considerations are valid for urban planning. Its latest methodological and conceptual developments show that it has ceased to be neutral in the face of economic and political choices. It participates actively in the choices involved in projections of continuous planning, or it renounces those choices and succumbs to the influence of prevailing forces, as occurred in the 1950s with the passive conception of technical town planning.

Juridical and economic aspects. As a preliminary to this discussion it is necessary to frame in historical and sociological terms the clear distinction between public and private property, which was a fundamental legal pillar of the last century and which today supports the juridical structure in many countries. The 1789 Declaration of Rights of Man, the conceptions of classical economics, and the policy of free-economy reforms all accompanied the beginnings of the industrial revolution and the development of capitalism. According to this distinction between public and private property, private individuals can exercise the right to use land under the various forms of ownership or possession for a given period. They also have the right of transformation of the use, including land improvement; this right, however, appears almost everywhere to be mitigated (more through local custom than through law) by norms or regulations that limit its exercise. To the public authorities, on the other hand, is delegated the duty even more than the right to provide what pertains to public use in the urban complex: roads, squares, parks, sewer systems, and public buildings. This rigid distinction between what is public and private (upon which were eventually based the geometric designs of expansion and street layout, with a precise subdivision of the land according to the two groups possessing rights) creates the necessity for transfer operations. While transfer from the public domain to the private domain continues to occur according to custom (by means of conveyance of property or by concession of use as in England and Holland), transfer from the private to the public domain is instituted, protected, and regulated by coercive acquisition in the form of expropriation, as a subrogation of friendly acquisition whenever this latter cannot be carried out.

The first law on "expropriation pour cause d'utilité publique" was the French law of Mar. 8, 1810. Decades later, similar laws were adapted from it in various countries (e.g., Holland,

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

1851). The Italian law of 1865 on expropriation for public use takes on particular importance because expropriation and the formation of extension plans were jointly regulated therein, considerably in advance of other countries (Sweden, 1874; France, 1884). Under the Italian law of 1865 expropriation for public use was allowed only in connection with plans developed in three successive phases: a general development plan, a declaration of the project's public utility, and a detailed executory plan. Indemnity for the expropriation was fixed at a price the property would have obtained through negotiation of sale in a free-market purchase, but the "special and immediate advantage" that would accrue to the unexpropriated part of the property as a result of the execution of the public work was estimated and subtracted from the indemnity. An obligation could be imposed on the owners of adjoining property to contribute to the execution of public-utility works by paying a contribution "equal to half the greatest value which would result from the execution of the works of public utility." Lastly, this Italian law initiated the submission of building and development plans for built-up areas, which generalized the institution of the general plan showing the maximum requirements of individual public works operations. This opened the way to a comprehensive vision of the various operations in an urban complex. With these juridical principles the law of 1865 could well have represented an auspicious beginning of good legislation to regulate the juridical and economic relationships of urban planning; however, these relationships were not developed in subsequent Italian laws, and many of the laws have been interpreted in a restrictive sense.

The principal juridical problems of contemporary urban planning in other countries can be dealt with in two ways: either by analyzing the planning legislation within the framework of the individual juridical-administrative structures of the various countries and then examining the legislation comparatively, or by grouping these problems into major classifications. The second procedure will be followed here for the sake of brevity, although the first would be the correct method for a specific and complete scientific treatment, which is still unfortunately lacking. One major group of juridical-administrative problems is related to the institution of the various types of plans in terms of administrative and operational levels. The problems are therefore linked to the definition of content and the juridical validity of the ordinances pertaining to every type of plan, to the powers delegated to the various planning authorities, and to procedures for the preparation and approval of the plans. This matter has not only a formal character — the consistency of the plans with the administrative structures in the various countries and with the degree of centralization of these structures; it has also a substantial character — consistency with the practical and theoretical content of the urban planning desired.

A constant rule, almost without exception, is the delegation to community authorities of planning power at a local level. This delegation of authority is far more varied at the intercommunal and supercommunal territorial level. At the intercommunal level, associational formulas take the lead in the more democratically mature countries, to the point of adopting forms of joint representation on committees; this occurred in the Regional Planning Committee of Oslo, with its 21 planning districts in the metropolitan area. At the supercommunal level there are various delegations of power, ranging from elective jurisdictional bodies (e.g., provinces, counties, *Länder*) to mixed technicoadministrative bodies, as in France and in Italy during the unsuccessful experiments with "territorial plans of coordination" in the 1950s. On the national level, where there is national development planning, as in Holland, supercommunal planning is placed under the authority of a state service directly responsible to the government. In countries with a planned or programmed economy the integration of urban planning with the various forms of economic programming or planning exists on the regional and national levels in Holland, France, Poland, and Yugoslavia. But on the local level, urban planning, even in the most plan-minded countries, has not yet attained a sufficient degree of interpenetretation with economic choices, except in Poland.

Almost everywhere the types of plans correspond to the levels of planning; and almost everywhere, in addition to the over-all plan, the projected program of execution is known under varying denominations (project development, *plan masse*, *Bebauungsplan*, *piani particolareggiati esecutivi*, etc.). In countries where urban planning has assumed a more distinctly operative character, plans on a local level are being articulated into three broad categories, as in Poland: directional plans (long term), prospective plans (15 years), and developmental plans, or plans of execution (5 years). To ensure adaptation of the plans to the actual phases of execution and to the more distant objectives, the institution of periodic revision is maintained in nearly every country. Plans "for an indefinite period" in the Italian law of 1942 appear increasingly anachronistic; such plans are destined to pass from an initial rigor of conception to a most permissive elasticity in interpretation, which empties them of any programmatic content.

The forms of planning in various countries differ mainly in the instruments of execution, in terms of objectives and modalities of town-planning policy adopted and pursued. Execution conceived as the mere application of the ordinances of the general plan (as occurred in Italian town planning in the decade 1955–65) or based essentially on zoning norms (as in the United States) is almost universally giving way to the more complex and programmed procedure of project development for residential complexes and work areas to be executed through public auspices (Holland, England, West Germany), or to plans of programmed communities (Scandinavia; France, *zones à urbaniser en priorité*, or ZUP; the U.S.S.R., *rajony*; Spain, *poligonos*; Italy, INA-Casa districts, CEP, etc.), or to plans of subdivision to be realized through private initiative, but technically or juridically regulated (France, the United States, the Scandinavian countries).

By now almost completely subdued in many European countries is the plague of lot divisions, which were abusive and too easily granted, which were executed without suitable urban amenties, and which, for example, in one decade ruined the suburbs of many Italian cities and invaded coastal areas, countryside, and archaeological sites. Scattered and diffuse urbanization or construction in the form of uninterrupted ribbons along the roads is prohibited by specific legislative acts, as is the case in England (Restriction of Ribbon Development Act, 1935) and Holland. A more mature awareness of the civic and social function of urbanization now demands a more qualified final product not only from public institutions and cooperative societies but also from private lot division. Even the North American Levittowns, enormous spreads of tiny lots in a city extension, boast a higher and more consistent standard compared with recent Italian subdivisions; they also lend themselves to easier and more frequent operations of renewal and transformation because of the techniques employed and the density and low height of the buildings.

In the actualization of the plans, particular importance as a qualifying element is increasingly assumed by the quantity and quality of the works of primary urbanization (neighborhood streets and pedestrian ways, parking lots, gardens, neighborhood public facilities, etc.) and general urbanization (main streets, parks, schools, business centers, etc.). The areas intended for these establishments and services should be specified in the plan of execution (and only a project-development plan, carefully studied and rigorously effected, can guarantee this). Furthermore, each idea should be carried out at the right moment and with the suitable technical requirements. It is also at this point that the qualifying element of townscape enters as a process of giving character to the urban space in formation. In order that this may occur, strict respect for the provisions of the executory plan is necessary, whether by public institutions or private individuals. Special care and attention must also be devoted to the planning and directing of urban works; thus it is essential that the plan of execution have operative and juridical validity. With this aim in mind several countries have adopted different juridical tools. These include (1) replotting (widely practiced in France as *remembrement*, in West Germany as *Umlegung*, and in Holland); (2) regulatory systems for sub-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

division (e.g., in France, where special legislation concerning *les lotissements défectueux* has been introduced since 1928, and where the more severe norms have been in effect since 1958; (3) the requirement that public works accompanying urbanization be executed by the private subdividers or by *sociétés d'économie mixte* (mixed nonprofit housing-rental associations) as is customary in France; (4) subordination of the granting of the building permit to the execution of the works of urbanization (Denmark and Sweden); and (5) more drastic systems of preventive acquisition of the land by the municipality, which have proven efficacious. Preventive acquisition or condemnation and annexation of urban areas is widely practiced in Holland, in Sweden, in Denmark, and in the construction of the English New Towns. In Holland the communes own about 62,000 acres of urban land (1965), of which about 12,000 acres are in the city of Amsterdam alone; Stockholm owns about 19,000 of its 45,207 acres of communal territory and about 25,000 outside the boundaries of the commune. Land acquisition in these countries occurs long before the execution of plans, so that the sale or expropriation price reflects the true market value of the agricultural land rather than the inflated value based on speculation and anticipated sale to the commune.

In these circumstances speculative operations are excluded and do not increase the cost of the finished product (land, facilities, and building). The building sites ceded outright or, as is very often the case, as pluridecennial concessions to institutions, cooperative societies, and private individuals are not only freed from the costs of intermediate transitions but are also guaranteed to be fully equipped for urban life. But wherever the preventive acquisition of land is not practiced, there inevitably occurs, mainly on the fringes of the large cities, an artificial price rise for sites of potential urban use. In some cases prices reach high multiples of the original agricultural value; a hundredfold is normal for suburban areas, but much higher multiples may be attained. Even in suburban or semisuburban areas, land cost may equal the value of the new development. In such situations the amenities of urban living are often completely neglected and the burden of providing them is passed along to the local community. The user (buyer or tenant) therefore not only pays the "plus value" but also, as a member of the local community, contributes to the costs of urbanization. In such cases a partial recovery of the plus value is attempted through fiscal systems that are sometimes extremely severe, as in the United States and in West Germany. Such taxation has also been introduced in Italy, but on the basis of a modest aliquot of the plus value that does not guarantee indemnification of the cost of urbanization to which the yield must in part be attributed.

From the foregoing it is evident that in all countries the problems of plan execution are not merely technical but also juridical, economic, and fiscal, with the latter factors in constant evolution. It is a widespread conviction that the problems of an urban planning capable of functioning actively and comprehensively in all fields are inseparable from the problems — and solutions to the problems — of private property. This principle was confirmed in a recommendation of the 37th Congress of the International Federation for Housing and Planning (1964) in Jerusalem: "In all countries the implementation of planning for a redistribution of population depends on attaining the optimal land-use by legal and fiscal measures of expropriation and redistribution of land" (Theme 11, "National Planning for the Redistribution of Population and for the Building of New Towns," Proposed Recommendation 2).

PROBLEMS AND PROSPECTS. *Basic data for a town-planning accountancy.* To formulate a general outline of urban planning throughout the world since 1945 is nearly impossible. Sources of information and basic documentation are lacking in the field, and local conditions are usually in a state of flux and are rarely subjected to periodic scientifically conducted financial surveys. The fundamental data of interest solely to planning are rare, discontinuous, and not subject to comparison. Economic and political options frequently escape critical analysis and are speciously presented in a controversial form based on opinion. Even the periodic statistical bulletins of the United Nations, which abound in information in all fields, including building as industrial productive activity, are totally lacking in town-planning data for the various countries. Such data might include (1) information concerning existing situations, with evaluations of the dynamics of urban life according to (*a*) size of cities or complexes, (*b*) degree of economic development, and (*c*) indices on availability of dwellings, facilities and services for industrial areas, and traffic; (2) information relative to urban plans that have been activated (created, revised, executed, in process) and to programs of financial investment within the various sectors and on the various administrative levels; (3) information concerning the results obtained, specifically (*a*) the dimensions of the residential and industrial areas that have actually been urbanized, (*b*) the urban facilities with which these areas have been furnished, (*c*) the costs of individual facilities and of the over-all development of areas, which, moreover, are subdivided into areas of public and private urbanization activity, and (*d*) a financial survey of the infrastructural works and services carried out in these areas.

It is evident that the collection and comparison of such data according to a homogeneous basic methodology would permit not only an international evaluation of the characteristics and dynamics of various situations but also an estimation of the varying dynamics of intervention and an evaluation of their quantitative and qualitative effects. The basic data would not be difficult to obtain, given the will to do so; but its collection should be pursued in a methodical and organized fashion.

It would be quite easy to construct models based upon these data that would allow an estimation of urban investment per inhabitant in various cities and countries. More significant indexes of urban conditions and well-being could thus be obtained. On an international level, only the United Nations can promote the finding of such data. The information would also encourage various countries to establish a national town-planning account as a category of national accounting, which has become a recognized preliminary for the formulation of economic programs and has already been promoted at an international level. National town-planning accounting would in turn prompt the same kind of accounting on the local level, where it would be conceived as a balance sheet of insufficiencies and needs, on the one hand, and interventions for the satisfaction of these needs, on the other. In terms of socioeconomic accounting the balance becomes clear in a comparison of the "costs" of public and private investment with the direct and indirect "profits," whether projected or realized. In this way the comparison between effective supply and real demand for town-planning resources and services at a given moment or period of time could be evaluated for every city, complex, metropolitan area, territory, region, or country. Generalized balance sheets for the various local units would thus permit the aggregation of comprehensive balances for larger territorial units, up to national units, while through disaggregation of the large national figures it would be possible to specify the limits within which individual local budgets might vary, thus obtaining verification of the internal coherence of the system and the adaptation to circumstances and to available funds.

A hypothesis of this sort would permit the incorporation of town planning into the framework of a democratically controlled economic planning, thus definitively removing local and central town planning from the facile temptations of technical improvisation, discretionary powers, and sectional outlook that, together with the maneuvers of power and pressure groups, characterize the irrational and precarious politics of immature democracies. Local, regional, and national town-planning balances have not yet come into use because the important data are lacking or are not brought up to date or methodically elaborated. Moreover, the necessary operations for elaborating such data are highly complex, though they are now facilitated by the use of electronic computers.

At the present time the formation of planning budgets, although still in a phase of preliminary scientific exploration or individual and limited research, nevertheless seems to be the only possible instrument capable of satisfying the legitimate

Residential areas. Elementary clusters of buildings; (1) Bremen, Grolland, zone divided into lots with individual houses; (2) Stevenage, row houses; (3) Malmö, Sweden, Augustenborg, L blocks; (4) Amsterdam, Watergraafsmer, project, double L blocks, 1921–50; (5) Turin, Falchera, winding block, 1951; (6) Stockholm, Aktersegeln, star-shaped block; (7) Stockholm, Danviksklippan, tower blocks, 1948. Elementary traffic schemes: (8*a*) branching; (8*b*) cul de sac; (8*c*) flow; (8*d*) external ring; (8*e*) internal ring. Traffic schemes within residential areas: (9) Herringbone distribution, Copenhagen, Sondergardpark, 1949; (10) Turin, Falchera, radial distribution, 1951; (11) Radburn, N. J., penetration based on cul de sac, 1938; (12) Stockholm, Vällingby, combination of peripheral ring, cul de sac, and penetration, 1948; (13*a*, *b*, and *c*) closes or recesses in streets; (14) Radburn, N. J., designed by C. Stein and H. Wright, 1928; (15) Baldwin Hills Village, Los Angeles, designed by C. Stein and R. Johnson and Associates, 1941; (16) Amsterdam, Slotervaart, 1954; (17) Matera, Borgo Venusio, designed by L. Piccinato, 1953; (18) Welwyn Garden City, designed by L. de Soissons, 1920–26; (19) Örebro, Sweden, Rosta, designed by S. Backström and L. Reinius, 1947–52; (20) Helsingør, housing estate, designed by J. Utzon, 1956.

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

aspiration to a rational urban planning in which decisions are taken at the proper time with full knowledge of the goals and in which the execution is always controllable and verifiable through administrative accounting. This objective subsumes one of the most urgent and perhaps most important methodological problems in the field of town planning; its solution will decisively influence town-planning developments in the coming decades. Specific preparatory studies in this direction are not numerous. Among them should be included research on the costs of urban development by P. A. Stone (*Housing, Town Development, Land and Costs*, 1963) and on the economic evaluation of urban land by E. Rams (*Principles of City Land Values*, Worthington, Ohio, 1964), as well as the theory of limitations by Malisz ("Analisi delle possibilità di sviluppo urbano," *Urbanistica*, XLII, 1964) and the experimental applications of optimum land use in the preparation of the general plan for Warsaw (cf. K. Olszewsky, in *Urbanistica*, XLI, 1964).

The problem of town-planning accounting finds ample support in the developments of the theories of spatial economy. Its precedents are derived from hypotheses by Van Thünen (*Die Isolierte Stadt*, 1826) on the influence of transportation costs in the agricultural economy, from research on the optimum location for industry by A. Weber (1929), and from studies on the hierarchical organization of territory by Christaller (1933). One line of investigation extends to general theories on territorial balance in the sphere of free trade by Lösch (1944) and E. von Böventer (*Theorie der räumlichen Gleichgewichts*, 1962); along another line, investigation extends to analysis of regional and interregional input-output and the applications of interregional linear planning, both of which have been explored and investigated by W. Isard (*Methods of Regional Analysis: An Introduction to Regional Science*, Cambridge, Mass., 1960) and his school.

The methodological development of research in these fields, the application of economic calculation to urban problems (J. Lesourne, *Le calcul économique*, 1964), and the practical applications in urban transportation, with the economic comparison of alternative solutions (undergoing wide experimentation in the United States and England) and, more rarely, applications on the town-planning level (e.g., the revision of the general plan of Genoa, 1963–65, where the attempt at an over-all balance for alternative spatial schemes has been made) should all lead shortly to the formulation of theoretical bases for town-planning accounting and to its practical application. Only when the methods of intuitive a priori synthesis have been abandoned will town planning emerge from the present empirical and experimental phase on analytical research by sectors. And only when the tools for an over-all *ex ante* verification of the optimum choices have been obtained will town planning be completely mature. In this perspective, also creative invention will have found the proper limits of its field of action for every type and size of intervention and the present uncertainty as to the delimitation of each theme will have been overcome. Otherwise creative invention bears the improper responsibility of defining and choosing the theme itself, with disastrous consequences for the product and the creative process.

Specific problems. Without violating the principle of an over-all perspective, certain fields of intervention in which special techniques and methodologies have been developed should be examined separately. For these fields specific delimited problems have evolved. The main focuses of specific planning intervention are new residential districts, central-city areas and urban renewal, business and administrative centers, industrial complexes, urban traffic, and the organization of recreation. These must not be understood as fields for independent and sectoral action but, rather, as interdependent focal points within a necessarily unified process.

a. Residential districts. Specific literature on this subject has reached extraordinary dimensions proportionate to the great diffusion of the aforementioned type of planning and intervention, which has become general in many socially advanced countries where collective dwellings prevail. The subject is treated in detail in numerous architectural reviews. In certain

countries the residential district has become the smallest unit in planning and execution, at which level architectural design is usually practiced. The planning of single residential buildings is becoming more and more exceptional. The most recent efforts are connected with the tradition of the modern residential district, which goes back to the architectural experiments of the rationalist currents of the 1930s, mainly in Germany and Holland, and the organic currents in England and the United States.

From 1945 to 1950 the planning and execution of residential districts experienced a revival in Sweden through communal and cooperative initiatives. The districts were subjected to profound innovations that, through a free compositional distribution of the building (or structural) masses, attempted a unified characterization. New importance was assumed by the design unit, which usually contained a portion of natural land with rocks and trees or, more rarely, equipped recreation areas. The districts of Torsviksjöden at Lidingö (PL. 158), Gröndal (1946), Råcksta (1948), Blackeberg (1948) and Danviksklippan in Stockholm (FIG. 237), Rosta (1947) and Baronbackarna in Örebro (perhaps the most exemplary of all; FIGS. 237, 243) immediately became famous. The names of their various creators also became well known, from architects such as Sven Backström and Leif Reinius to community officials such as Sven Markelius, Hakon Ahlberg, and Goran Sidenbladh, who composed the nucleus of the Office for the Master Plan of Stockholm. To Backström and Reinius are due the impressive "town sections" of Vällingby (1953), for 60,000 inhabitants, and Farsta (1960), for 43,000 inhabitants (PLS. 158, 159). The Swedish residential complexes became synonyms for freedom of conception and organic research in spatial distribution and were accepted as models in many countries. Undoubtedly they represent a period of fertile inspiration; nevertheless it was followed by a phase of weariness and discontinuity, showing the limits of markedly formal planning research and of execution that was often hurried and lacked carefully conceived development. These weaknesses, however, were redeemed by civic and business centers of great vitality and refinement, such as those of Vällingby, Farsta, and Råmgsved, and by the breadth of conception of the surrounding natural environment. These surroundings are highly protected, and they both separate and connect the new complexes.

Almost contemporaneously there developed in Denmark a similar flowering of residential communities (PL. 160) that are distinguished from those in Sweden for their more refined architecture. While stressing the unitary character of the communities, the architecture also emphasizes their lack of relationship with one another and with the metropolis — a characteristic that derives from the rationalist tradition. Here, too, the names of the most significant districts [e.g., Gentofte, 1947; Brøndyparken, 1947; Bredalsparken, 1949; Voldsparken, 1949; Bellahøj, 1951; Skoleparken, 1933; Nygårdsparken, 1955; the small residential nuclei of Kingo at Helsingør (Elsinore), FIG. 237; and Fredensborg, 1962] are associated with those of their creators, including Arne Jacobsen, Eske Kristensen, Kay Otto Fisker, and Jørn Nielsen.

In Finland some districts of great interest were established during the 1945–55 decade, such as those at Rovaniemi (1945) and Otaniemi (1948), built after a project by Hugo Alvar Henrik Aalto (q.v.), and the garden city of Tapiola (1952), about 6 mi. from Helsinki, which is laid out over 667 acres and contains 17,000 inhabitants. It includes a business and cultural center and is a remarkable example of nonspeculative private enterprise promoted by a foundation (Asuntosäätiö) of associations and unions.

In Holland the most urgent and serious problems were those of reconstruction in the devastated areas. One of the most significant achievements was the planned reconstruction of the 642 acres of central Rotterdam. Following this, methodical execution of the new districts for the western expansion of Amsterdam was resumed according to the plans of the prewar period that were gradually brought up to date and minutely planned and executed. To this planning process must be added the new expansions of Rotterdam, with the large district of

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

Tuinstad Zuidwijk planned by Van Tijen and Maaskant. Since urban planning in Holland has reached a high degree of maturity, its results are widely diffused in large and small cities and in the rural areas, where the process of land (or lot) division and farm reorganization is covering a considerable expanse of territory. Up to 1960 replotting had been completed or was in process in about one-tenth of the agricultural territory and was being prepared for more than one-third of the agricultural territory in all. Lot division in Holland attains high technical efficiency and democratic participation, as in the exemplary plan of Kampereiland. The widespread planning process has caused the Dutch urban districts and rural complexes to lose their fragmentary character. The entire country is now a rural-urban continuum of modern civilization.

In England the building of new planned cities or towns in the early postwar period took on special meaning in the context of the extensive reconstruction and renewal that characterized the town-planning and construction policies of the first postwar Labor government. The period saw a search for the integration of existing districts and central cities in the sphere of urban planning and for the proper execution of urban residential districts. Examples include Roehampton Estate (PL. 162) and Loughborough (both, 1952) in London, built on plans by the London County Council; Park Hill in Sheffield, Yorkshire (1961); the planned residential nuclei inserted into smaller cities and villages, in which the modest scale is set off by extremely careful townscape work, as seen in the complexes of Rushbrooke, Suffolk (1954) and Bedmont, Hertfordshire (1961); and the simple cluster of houses of St. Mary's Close, Shincliffe, which are arranged around a community garden (1961). Fifteen New Towns under construction in the decade 1946–56 for a total of 895,000 inhabitants (of which almost 494,000 were settled by Dec. 31, 1961) and two more projected cities constitute a significant achievement. The New Towns were born of the developing cultural tradition of garden cities, of political preparation by the Barlow (1940), Scott (1942), and Uthwatt (1942) committees, and of the creation of the Ministry of Town and Country Planning (1943). They were conceived within the framework of a national program for decongesting the London metropolitan area and for transferring the excess population from underdeveloped areas. The New Towns Act of 1946 made the existence of the towns possible and established the development corporations entrusted with the planning, construction, and management.

The first New Towns of the postwar period were Stevenage (PL. 161), Crawley (1947), Harlow (1947), and East Kilbride (1947), based on extremely low densities and built as distinct towns around a civic and business core. Through a critical evaluation of the results and basic ideas and an exhaustive study of Hook (PL. 162), which was never built, new and more compact plans were developed. These no longer required a core but, rather, a true central high-density "spine" for the activities of communal life, as well as areas of variable density that were not excessively decentralized from the "spine" axis. Cumbernauld in Scotland was designed according to this model. Its execution undoubtedly represents the most mature result achieved by town planning in the United Kingdom in the 20 years between 1945 and 1965 (PL. 163).

Contrasting opinions have been expressed on the cultural balance of the New Towns. On the one hand, there is the passionately favorable stand of F. J. Osborn (1963); on the other hand, there have arisen polemics over the failure of the idea of the New Town as an unnatural antithesis of the expansion of existing cities, and critics have laid stress on the difficulties of the starting procedure (Rodwin, 1956), on certain compositional and sociological inefficiencies resulting from the excessively low density of the first accomplishments, and on the faults in spatial and planning details. There have been many concrete replies with regard to these criticisms in the form of alternative solutions.

No less vital than the Scandinavian and English experiments in this field are those of the French, which originated immediately after World War II in a systematic application of *remembrement* in reconstruction plans such as those of Maubeuge (architect André Lurçat) and Le Havre (project by Auguste Perret). Also from those years came Le Corbusier's *unité d'habitation* experiment in Marseilles (I, PL. 388; IX, PL. 107).

To these first grand and audacious conceptions were very soon added, beginning in 1947, the *habitations à loyer modéré* (H.L.M.), residential districts and nuclei carried out by private, public, or mixed nonprofit rental-housing associations. Another development was the establishment of the *sociétés d'économie mixte* with the participation of public institutions and financial organizations. From 1950 on, operations involving 500 to 1,000 or even up to 2,000 units were undertaken. These operations demanded special shrewdness in the acquisition of building sites (the Loi Foncières of 1953 provided for this) as well as in the furnishing of an infrastructure of services and public facilities.

The H.L.M. enterprises multiplied rapidly and included the districts of Saint-Dizier-le-Neuf (architect, A. Croizé), Chalon-sur-Saône (architect F. Jerrold), Bordeaux-le-Benauge, as well as a great number of districts or suburbs in the Paris area (PL. 153). In those years, project development gradually increased both in the number of projects built and in the size of each project. At first there were 1,000 dwelling units, but later there were 2,000 and more; the districts became *grands ensembles* with increasingly complex and abundant public facilities.

These new dimensional requirements were provided for in 1958 by legislative measures that introduced into the urban-planning technique the *zones à urbaniser en priorité* (ZUP); for such zones detailed construction plans were drawn up in advance and land was reserved. Among the *grands ensembles* executed in the 1950s in the Paris region were the big complexes of Marly-les-Grandes-Terres (architects M. Lods, J. J. Honneger, and J. Beufé), Pantin-les-Courtellières (architect Emile Aillaud), Sarcelles (architects Boileau and Labourdatte), and Massy-Antony (architects P. Sonrel and J. Duthilleul). Among the large districts that almost constitute modern duplicates of the cities they adjoin is Bagnols-sur-Cèze (architects Candilis, Jossic, and Woods).

After 1958 almost all the larger French cities arranged beforehand for the options of the ZUP in their plans and provided for the drawing up of the corresponding *plan masse*: Alençon (FIG. 243), Annecy, Brest, Bordeaux, Clermont-Ferrand (PL. 171), Dijon, Epinal, Lyons, Marseilles, Nantes, Nîmes, and Rouen. For many of these large districts a planning competition was established, as was the case at Caen-Hérouville and Toulouse-le-Mirail (FIG. 243). George Candilis's group emerged as the winner with its plan for Toulouse-le-Mirail and for the model of a new city of 100,000 inhabitants. In the present panorama of French town planning the Toulouse-le-Mirail plan is the most interesting and organic.

On the whole, the French experiment of the *grands ensembles*, which were carried out as H.L.M. and ZUP operations, can be considered highly positive on the levels of organization, financing, and quality of planning and building; they are notable for the compositional breadth of the large neighborhoods and spaces, for the services furnished, and for experimentation in new construction techniques. What is lacking in the *grand ensembles*, however, is integration into the urban context, from which they often break away in a violent and deliberate manner to form independent physical and sociological entities. Fragmentary operations persist, and new legislative measures for a more extensive preventive acquisition of land have long been under study. Such measures would allow the development of long-term programs and, consequently, a more interpenetrated organization of the whole.

In West Germany during the first decade after World War II the problems of urban reconstruction and redevelopment predominated. Only later did the phase of development and extension take shape. Nevertheless, in some large cities, such as Hamburg, Cologne, Hannover, and Frankfurt am Main, residential development in the form of planned districts soon began again; this was accomplished through communal or cooperative initiatives, and the districts were inserted into overall development plans. Quality standards are exemplified by

the Hamburg districts of Lurup (1956, for 40,000 inhabitants) and Denickestrasse (1958); in Cologne, the district of Vingst (PL. 166) and the new city for 100,000 inhabitants begun in 1960; and the lively Romeo und Julia residential nucleus by Hans Scharoun in Stuttgart (1957). A new city deserving special mention is Sennestadt (PL. 166; FIG. 243), begun in 1954 and designed for 20,000 inhabitants. It was planned by Hans Bernhard Reichow on the principles of organic structure with fluid circulation (Reichow, 1948, 1959).

In Italy the production of planned districts in the 1950–63 period was almost essentially the work of the INA-Casa, established by law in 1949 as a plan for increased employment and directed by the Ministry of Labor. In its first 14 years of activity the INA-Casa realized the construction of 1,920,000 rooms in 355,000 dwelling units, corresponding to about 15 per cent of the aggregate national construction of that period and comprising almost all state and subsidized building activity. Many dwellings built with these funds have been grouped in nuclei or complexes. A number of these were town-planning designs of good quality, but their insertion into the urban context of the various cities was not always sufficiently evaluated in general terms. This caused fragmentary arrangements, often accentuated by excessive research in spatial composition, as well as actual confusion in the process of urban development. Despite these limitations, certain districts were successful for their exposition of compositional ideas (PL. 169): Bellavista in Ivrea (1959; architects L. Piccinato and V. Girardi); Falchera in Turin (1951; architects G. Astengo, S. Molli-Boffa, M. Passanti, N. Renacco, A. Rizzotti; FIG. 237); the Bernabò Brea development in Genoa (1951; architects L. C. Daneri, L. Grossi Bianchi, G. Zappa); Cesate, near Milan (1951; architects F. Albini, L. B. Belgioioso, I. Gardella, E. Peressutti, E. N. Rogers), Harrar in Milan (1951; architects P. Bottoni, L. Figini, G. Pollini, G. Ponti), Monte Olimpino in Como (1954; architects E. Cerutti and P. Lingeri), Via Campano in Rimini (1958; architects P. M. Lugli and C. Dall'Olio).

Parallel to INA-Casa, considerable building activity was carried out in Italy during these same years in the field of agricultural reform by UNRRA-Casa. Examples are the new complexes of La Martella (architect L. Quaroni; PL. 169) and Borgo Venusio (1953; architect L. Piccinato; FIG. 237), both in Matera. Beginning in 1956, it seemed that better results in town planning could be achieved if the Ministry of Public Works coordinated in districts called CEP (Coordinamento di Edilizia Popolare) the various activities of state-subsidized residential construction, of the INA-Casa, and of certain other public institutions and cooperative societies. The most important national representatives of town planning urged this coordination (L. Quaroni, "La politica del quartiere," *Urbanistica*, XXII, 1957). Unfortunately the results have not been proportionate to the aspirations in the 31 projects undertaken. Only a few of the districts have reached satisfactory completion — for example, Le Vallette at Turin (coordinating architect N. Renacco). Excellent ideas such as Quaroni's project for the CEP district of San Giuliano in Venice have for various reasons remained on paper. If the district policy has not generally produced results comparable to the financial outlay the cause is essentially a lack of a satisfactory town-planning policy for channeling and guiding the impetuous building development promoted by private initiative, which during the first 14 years of maximum state effort represented 84 per cent of the aggregate building activity and subsequently reached 94 per cent. This has overwhelmed all public initiative and limited it to the fringe of its prescribed field of action.

Discussion of the construction of residential districts in the socialist countries will be limited to a few examples and a few countries. In the U.S.S.R. town planning after World War II was long conditioned by the requirements of reconstruction and by an enormous shortage of housing. The problem of quantity took priority over other considerations and influenced technological procedures for mass production; work had to be carried out in the shortest possible time and with the smallest possible amount of manpower. Thus processes of heavy prefabrication were developed, and the spatial composition of large sections of buildings (average 8–10 stories) was partly conditioned by technological limitations. But the greatest obstacle to the affirmation of an autonomous and original conception of urban space was the undisputed rule of the academic in architecture. In 1930 Stalin repudiated modern architectural trends, and this attitude prevailed until 1954. Monumentality, imposed at all costs on every building, was achieved through abstract late-19th-century schemes based on symmetry and the stylistic orders. Every creative impulse was inhibited and frozen in a forced formality. Traces of this approach appear in the new quarters of Moscow, in the renewal operations inside the city, and in the construction along the Moscow Prospect. The most obvious demonstration of this is the large southwestern urban area, whose axis is formed by the Lenin Stadium, the Lemonossov University, and the Palace of the Soviets — not only in the large monumental buildings and the generous, geometrically arranged green spaces but also in the spatial composition of the various residential districts (in the form of symmetrically arranged uniform sections) lined up on the eastern side of the area.

The rejection of academic restrictions after 1954 led to new conceptual formulations that are visible in the first experimental project of Novye Cheremushky (PL. 167) and in the new district projects prepared by the Giprogor of Moscow, the institute for planning, which, with 800 employees, provides for urban planning in all the territory of the Soviet Republics with the exception of Moscow, Leningrad, and Novosibirsk. In 1959 Moscow's first satellite city, Sputnik, was planned for about 70,000 inhabitants, incorporating new, freer, and fully acceptable compositional criteria. Later developments in administrative decentralization, urban planning, and the construction of new residential districts should facilitate the search for solutions that will be more differentiated and relevant to local realities.

In Poland, too, the problems of rebuilding were harrassing, especially in Warsaw; but here such obstacles as those imposed by the Soviet academy did not operate, except very slightly in the first phase of reconstruction. On the contrary, the solid Polish cultural tradition was able to develop autonomous research in theoretical city and regional planning. New residential districts continue to be planned and built, as can be observed in Warsaw. Among the experiments in *ex novo* creation are Nowa Huta and Nowe Tychy in the department of Kraków, which are part of a regional plan for the spatial redistribution of economic activities (PL. 150).

Lively building activity characterized Yugoslavia after 1945. Important works in the sphere of city and regional planning are the residential complexes of Velenje in Slovenia (architect Trenz; PL. 168), the new cities of Ploce and Bar, and the extensions of Ljubljana and Zagreb.

In the United States no resumption or development of the policy and technique of urban planning occurred in the early postwar period. During the 1930s the United States had made a valuable conceptual and qualitative contribution to such policy and technique with the experiments of Radburn, N. J. (architects Clarence Stein and Henry Wright; FIG. 237); Greenbelt, Md. (planner Hale Walker, architects Douglas Ellington and R. J. Wadsworth; PL. 164); and Baldwin Hills Village in Los Angeles (planner Clarence Stein, architects Reginald Johnson and Associates; FIG. 237). Greenbelt and Baldwin Hills Village were the result of federal government initiatives. The three communities were, for their time, rare examples of town planning in an otherwise unplanned urban and suburban expanse. They are in great part a product of the determination and enthusiasm of Clarence Stein, a pioneer in American town planning. A later development was the 1954 project for the Mill Creek public housing projects in West Philadelphia with houses and apartment buildings designed by Louis I. Kahn, Louis McAllister, and Kenneth Day. A new sociological tendency toward rationalization of the suburban complex is the thriving movement for so-called "cluster development," based on a grouping of buildings in nuclei, with broad green spaces and public facilities among the buildings (W. Whyte, *Cluster Development*, New York, 1964). These clusters are designed to satisfy the newly felt need of Americans, tired of rootlessness, to become permanent members of a community. The most eloquent

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

example of the cluster development is the new community of Reston, Virginia (1963), which by 1980 should have 75,000 inhabitants divided among seven villages (PL. 164). The Department of Housing and Urban Development (HUD), instituted by 1965 legislation, is oriented toward a new and more rational trend in residential construction in the United States.

From these brief indications it appears that planned building activity in the various countries is lively, extremely varied, and full of problems. But only from a complete international outline for the years 1945–65 (not yet attempted) would it be possible to appreciate fully the worldwide effort to give a new character to urban complexes. However, it is apparent that the policy of *laissez faire* in urban development can only be condemned for the uncivil quality of its tangible results.

b. Central-city areas and urban renewal. Urban settlements show their vitality in ways other than by generating suburban expansions, whether spontaneous or planned. Most important, they live dynamically in the structuration which their historical development has gradually assimilated and which constitutes the existing city; upon this are grafted the expansions, whether marginal or structural. Qualifying the various forms of this vitality are: (1) the rational or irrational use of the preexisting urban heritage; (2) the passive acceptance of its deterioration as an inevitable product of use until that heritage completely degenerates or of its continued upkeep, rehabilitation, reclamation, or recovery *in extremis* is instituted; and (3) an attitude of prudent respect for the environmental characteristics of the ancient or recent historical fabric, or a tendency toward contemptuous destruction of those characteristics through fragmentary or systematic processes of substitution. Such traits not only qualify the forms of urban vitality, but they also illuminate the varied compound situations that are revealed, as well as the differing cultural attitudes of local communities toward the physical surroundings in which they are contained. The communities themselves are conditioned by their physical surroundings and in turn continually modify them.

Preservational, destructive, or substitutive attitudes toward the preexisting urban heritage are as old as the settlements themselves. The repetition from generation to generation of neolithic forms of settlement up to the present day is one of the strongest manifestations of preservation. Old urban outlines are often continued in settlements with successive cultural stratifications (FIG. 189). The smaller medieval complexes show endless variations on a few fixed themes; these, in turn, copy more archaic village experiments. Unreserved destructive and substitutive attitudes are also part of the history of cities and may be connected with important architectural structures that completely transform the urban countenance. Or these attitudes may affect substantial modifications achieved only through legal norms that have been assumed from time to time. The frequent adoption of one- or two-story building elevations in walled cities, for example, met the additional demand for dwellings without requiring the demolition and reconstruction of city walls.

It has been observed that in the past the village has shown a tendency to be sociologically and culturally static and therefore preservative, and that the city has been more dynamic and consequently often destructive and substitutive. It is not valid, however, to assume that this is true for the present or the future; the present cultural situation differs substantially from that of the past with regard to preexisting historical elements. The break in the continuity of modern culture that coincided with the industrial revolution, as well as the break in the continuity of architectural-urbanistic development, necessitated a different attitude toward the urban heritage. This new attitude, which corresponds to the attribution of unique value to things of the past, manifests itself in the demand for objects possessing this testimony (see PRESERVATION OF ART WORKS). For this reason it is no longer possible to justify culturally the destruction of historic buildings — those buildings universally recognized as historically significant and those which, although lacking high architectural value, document a deliberate and conscious attempt to create the physical image of the city. The latter group should be examined historically and critically before intervention. Historical and critical evaluation cannot be limited to buildings alone but must be extended to all external city spaces. In any historic urban settlement the buildings form a whole with the open spaces — streets, squares, kitchen gardens, internal gardens, internal and peripheral walls. Often the very distribution of these open spaces gives structure to the entire complex. It is actually the urban complex as a whole that serves as testimony, and inseparable from it is the natural, humanized landscape surrounding the city and within it.

Thus with regard to the historic settlements that have been partly or wholly preserved, or even continuously renewed in the course of time, modern culture expresses an over-all judgment that cannot avoid demanding measures of protection and preservative intervention. Certain operations must be resolutely condemned: (1) the so-called "liberation of monuments" at the expense of surrounding buildings; (2) restoration of the environment to a given historical period, eliminating evidence of following periods; (3) replacement of "minor" buildings that have environmental value with new buildings, even if the latter have the same dimensions; (4) insertion of buildings camouflaging themselves as old buildings through stylistic imitations or neutral architecture; (5) addition of stories to buildings; and (6) widening of roads with a historic outline as well as the "rectification" of ancient squares (FIG. 249). Environmental manipulations around historic monuments were in great favor during the last century and, unfortunately, are still undertaken, as in Barcelona, with the pseudo restoration of the Roman walls and "liberations" projected around the Basilica of S. María del Mar. Equally reprehensible is the aggregate of 700 stories added onto buildings in Venice between 1947 and 1962 and, during the same period, the destruction of historical environments in Padua, Ravenna, Naples, and many other old Italian cities through violent insertions and replacements.

War destruction has given rise to serious problems regarding the historic cores of cities. In exceptional cases faithful restoration of the destroyed monument is justified for sentimental reasons — for example, the market square in Warsaw (PL. 174) and Sta Trinità Bridge in Florence. Such restorations must be sustained by preexisting relief maps, the use of fragments, and stone building materials from the original quarries. But all stylistic or pseudomimetic pastiches are reprehensible, like the reconstruction of Borgo S. Jacopo and Via di Por S. Maria in Florence. Equally unjustified are the reconstructions of old road systems with widening of the road sections, as the reconstructions of destroyed areas in the French seaport of Saint-Malo (1948–58) and in Heilbronn, West Germany (FIG. 249). In cases of total destruction it is far more logical to restructure with modern criteria as was done in Coventry. Even more serious are problems posed by the salvaging of degenerated historic sections, which demands complex operations of preservative rehabilitation. Such operations involve (1) judicious restoration of the original external and internal parts of buildings without imitation or addition; (2) elimination of recent and damaging superstructures; (3) internal adaptation of the buildings to new valid purposes or to comfortable lodgings; (4) arrangement of the external spaces with street paving, tree planting, and suitable urban furniture; (5) maintenance of economic and commercial activities in the old sections; (6) the insertion (if absolutely indispensable for functioning of the whole) of new buildings of very high quality, which must be scrupulously controlled in terms of bulk and distribution and not include additional architectural expression.

These operations must be preceded by thorough internal and external stratigraphic surveys of the actual conditions and by historical-critical and sociological studies of the complex. They cannot be carried out in a fragmentary manner, building by building, but must be executed through detailed plans of organic complexes. In turn, these complexes must be inserted into master plans that solve in a unified way the problems of intended land use and of traffic and guarantee internal coherence. Excellent studies have been carried out in Regensburg (since 1960; FIG. 249), Genoa (since (1958; PL. 174), and Stockholm (since 1960) through research and plans pertaining to the re-

spective historic city cores. In certain French studies careful scale models were arranged in advance. These studies were conducted in Paris in the Marais district (since 1939) and are being projected for Saint-Germain-des-Prés (FIG. 249). They have been executed in Chartres and Lyons and in the redevelopment (with lower population density) of the district of Vesterbro in Copenhagen according to a plan formulated under the direction of S. A. Rasmussen. Forty Czechoslovak cities were redeveloped and restored in an exemplary manner in the decade 1950–60. From these experiences, from the significant shift in public opinion, and from studies on the subject it is clear that interest in the problem of protecting and evaluating historic city centers is now ripe; it depends solely upon the interest of the countries involved to carry out its solution. Financing can be facilitated by long-term loans; possible liabilities of the operation can be covered by adequate state assistance. This outlook is confirmed by the final resolution approved by the International Federation for Housing and Planning Congress at Santiago de Compostela in 1961: "The manner in which the problems of the historical urban centers are faced, and the attention given them, besides the capacity to accept the sacrifices their preservation entails, are all proof of the cultural maturity of society."

A completely different discussion is required for basic redevelopment operations in areas with no historical-environmental value. These operations may be undertaken because of necessary structural reclamation in dwellings that have degenerated into hovels, such as the English workers' cottages built during the 19th century or the single-story row houses in southern Italy with one-room units and only one load-bearing wall. The need for a radically different land use may also instigate extensive redevelopment operations. For example, the land may be covered with obsolete industrial factories that must be replaced; or, as in certain North American cities, the central areas may be antiquated and low in density; or there may be a need to create new administrative and commercial centers in areas which, because of special economic conditions (e.g., a port facility, a poorly educated population, a central territorial position), could become focal points for tertiary activities. In these cases it seems reasonable and opportune to conduct the renewal operations as a unified operation. This would permit greater freedom of action concerning land-coverage limits imposed by private property and the existing infrastructural network. The network must be remodeled and adapted to the new requirements of circulation, parking, and access to building complexes. The mapping of detailed construction plans becomes, in such cases, the indispensable operative tool. This is demonstrated by the numerous operations of urban renewal undertaken in various countries between 1950 and 1965: the redevelopment of the center of Philadelphia (PL. 151); the construction of the Golden Lane district in London (1954); the City Plan West for the business center in the neighborhood of the Copenhagen central station (PL. 177); the new business center of Sergelgatan in Stockholm (PL. 176); the administrative complex of La Défense in Paris (PL. 175); the business center of Heidelberg (PL. 175); the new administrative center of Milan (PL. 177); and the rebuilding and redevelopment of central Düsseldorf (PL. 152).

Significant among the redevelopment projects that were still in the planning stage in 1965 are those for the areas of Barbican and Piccadilly Circus in London (PL. 175); Cornwallis in Halifax (PL. 176); Santa Monica and the Golden Gateway in San Francisco (PL. 165); Fort Worth, Tex. (PL. 178); Providence, R. I. (PL. 178); the winning project for the new administrative center of Turin (PL. 177); and the impressive plan for the revitalization of Pennsylvania Avenue in Washington, D.C. The San Francisco and Providence projects are representative of a type of transformation in North American cities that ecompasses the entire downtown area; emphasis is placed on commercial, administrative, and cultural activities, and complete solutions are provided for the exclusion of vehicular traffic.

Even from these few examples it is apparent that the field of urban renewal is extremely promising. It has played a complementary role in the rehabilitation and protection of the historic centers of the large European cities; but it has had more extensive application in North American cities that lack any special character and, in general, in cities that have grown too quickly in a disorderly manner.

c. Vehicular traffic. Le Corbusier, observing the accelerating annual increase in the number of parking lots for automobiles in France, proposed the extrapolation of a tendential curve to create a town planning that would accommodate this phenomenon (1927). The facts have exceeded Le Corbusier's predictions. (In the United States, for example, the rate of average annual increase of 16 vehicles per 1,000 inhabitants between 1920 and 1930 reestablished itself without fluctuation after 1946.) The automobile has completely altered cities and regions to its requirements, creating innumerable new problems that are technical, economic, psychological, sociological, and hygienic. Problems concerning safety have also arisen. The automobile revolution is now an accomplished fact, but the necessary responsible choices or modifications of collective behavior have not yet occurred. Automobile development has been passively endured as an inevitable fact. Some attempts have been made, however, to adapt the existing or projected urban fabric by means of specific engineering techniques; but frequently there has been impotent surrender to the invasion of the cities by automobiles and the resultant antieconomic, chaotic, and dangerous situations of disorder, obstruction, and saturation. Even public services have within a few years become passive nearly everywhere as the preference given to private vehicles in free circulation and the congestion caused by the lack of adequate and timely measures have extensively reduced the use of mass transportation.

It is now clear that the problems of vehicular traffic cannot be completely solved with superhighways, intersections, multilevel approaches, exit routes, and cloverleaf patterns. These are designed to make the aggregate circulation as fluid as possible, so as to guarantee the maximum absorption of vehicular flow. However, such technical devices involve extremely high costs and considerable land coverage, and they can serve only as a skeletal framework for urban and extra-urban circulation, as do the spinal axes of the urban expressways in Germany (e.g., Düsseldorf, PL. 180; Essen; Cologne). Other examples are the main networks of expressways in many North American cities, such as Chicago, Los Angeles, Pittsburgh, and Kansas City, Mo. (FIG. 255).

When networks such as these are complete, after enormous financial outlays, the fluidity of traffic can be guaranteed only for the major arteries but not for secondary city arteries. Obstruction and congestion are therefore only partially solved. High-rate meters have been installed in parking places in central-city areas; underground or elevated parking lots have been constructed; and adequate parking spaces have been established in residential and office areas. Cities such as Vienna and Hamburg have adopted these opportune but not resolutive adjustments. A constant increase of motor vehicles according to the existing tendency will lead, by the year 2000, to four times as many motor vehicles in circulation. Even the total capacity of absorption of the freeways will be reached at some point, imposing burdensome and perhaps impossible duplication. The urban expressway system may be feasible in certain favorable urban-planning situations in which space is available or can be made available at tolerable costs (e.g., in various North American cities where the suburban and even the central areas have low density); however, it is not possible in all cities, especially in European cities with their high building density. The problem of vehicular circulation is not an isolated one, and it cannot be solved by expedients of traffic engineering that are brilliant but expensive. Nor is it helpful to deplore the modest sums spent by nations or various localities for technical solutions guaranteeing free circulation of private vehicles in cities. The problem is quite different. It must first be decided whether or not the free access of vehicles to every part of the urban territory (especially the central areas) has first option for the present and the foreseeable future. If so, the costs must be cal-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

culated and borne. But if it is not, or if the most ingenious technical solutions cannot guarantee free access, or if the costs required for its accomplishment are intolerable, then vehicular traffic in some parts of the urban fabric must be limited or completely excluded. Public means of transport must be substituted, and solutions toward integration and equilibrium must be found.

Thus posed, the problem becomes one of town-planning policy. It must be kept in mind that it is not traffic that engenders the city, but the city that generates traffic. Consequently the flow varies in relation to the intensity of exchanges within the city and to the spatial distribution of the origin and destination of the traffic itself — that is, the spatial distribution of the various urban elements and, therefore, of the general urban scheme.

There now exists a complex and thorough technique for surveying and forecasting traffic and for comparing alternative solutions. It is based on a series of related operations that permits (1) measurement of total flow on typical days and during selected hours of the day, and analysis of the flow according to the motives for the journey; (2) measurement of frequency of contacts between the point of origin and destination of traffic, and the fixing of preferred paths of traffic flow based on these measurements; (3) calculation, based on constructed models, of anticipated intracity traffic flow at certain periods of the day, assuming future development in accordance with existing flow tendencies and with various alternative planning schemes for the distribution of points of origin and destination; (4) full-capacity use of existing infrastructural networks (i.e., city streets); (5) verification of coherence between projected flow and projected capacity of infrastructural networks or, in existing cities, verification of capacity of absorption of the existing or modified network, assuming maximum use; (6) verification of financial congruity between different solutions and available funds deriving from revenue anticipated on the basis of the various schemes of the plan; (7) institution of an over-all balance between advantages and disadvantages ("costs" and "profits") of the automobile-circulation patterns and mass-transportation systems in the sphere of the infrastructural solutions proposed; and (8) evaluation of which among the proposed solutions is best.

The operations for reaching a rational conclusion are undoubtedly long and expensive; but certainly the optimum solution cannot be found only within a study limited to the infrastructural network as an autonomous element. This is the conceptual limit of the Chicago Area Transportation Study (1959–62). Urban planning imposes itself as a necessary and unsuppressible condition for the solution of traffic problems. An exemplary operative study in this direction, although still incomplete according to the conceptual scheme proposed, is the study arranged in 1962–63 by the city of Leicester, England (W. K. Smigielski, *Leicester Traffic Plan*, 1964). It evaluates the costs of two alternative solutions studied essentially in terms of redeveloping the central area. One alternative is based on the free circulation of private vehicles, with an adequate tangential network for flow around the center, necessary points of penetration, and parking in garages. The other alternative is based on integration between private and public means of transportation and requires a ring system of roads on the perimeter of the central city. Private conveyances park at the points, from which a network of special bus routes for public transportation branch off, using the "park-and-ride" system that has proved to be so successful in some North American cities. A cost comparison shows the economic advantages of the second solution, which is about one-third less expensive than the first.

The previously mentioned studies for the creation of pedestrian malls in Fort Worth and Providence were oriented in this direction. The same scheme was used in development plans for the central area of Newcastle upon Tyne (1961), for the reconstruction of Coventry (1961), and for the *Innenstadt* of Essen (FIG. 255), with a complete network of shopping streets for pedestrians. Restitution of the streets of the central city to the pedestrian is occurring in Oslo and is being provided for by plan in Västerås, Sweden, and in other Scandinavian cities. This constitutes one of the social benefits of reorganization and rationalization of the traffic network and has become a presiding principle in the planning of new administrative and business centers. The advantages of this principle are widely proven in numerous achievements, including the Lijbaan of Rotterdam; the "town sections" of Vällingby (PL. 159) and Farsta (PL. 158) in Stockholm; the civic centers of Harlow, Stevenage (PL. 161), and Basildon (PL. 156) in England; and the center of Cumbernauld in Scotland (PL. 163). The same principle is found in the various shopping centers built in suburban or even rural areas in the United States, including two built by Victor Gruen Associates: Randhurst Center (PL. 178), about 22 mi. from Chicago, and Northland Center (1955), outside Detroit, each of which has parking accommodations for 10,000 vehicles.

The esthetic aspect of road infrastructures is threefold: the work itself, the integration of the work into the urban or natural landscape, and the development of new dynamic urban and landscape perspectives. The major elements of the work in its three phases are the "unfolding" of the roadway, the width and elevation of the barrier between opposing lanes of traffic, the curves, the furniture (e.g., billboards, lights, directional signs), and the completion of the entire road area with greenery. In Italy, one example of a technically inadequate work that disfigures the landscape is the highway (1963) between Perugia and Foligno, which passes below Assisi and Spello. Its poor quality becomes apparent when compared with the excellent technique and esthetic effects of the examples illustrated and discussed by Tunnard and Pushkarev in their study *Man-made America* (New Haven, 1963).

The Crowther and Buchanan reports, published in *Traffic in Towns* (London, 1963), clearly show the justification for alarm concerning city traffic problems in the immediate future. The reports also illustrate the acute interest in an urgent and rational solution and the necessity for further investigations and experimental verifications. The skill and delicacy with which these problems can be solved from the point of view of urban planning is shown by Paul Ritter (1964). The solutions impose themselves at all levels as a priority requirement for survival under civilized conditions.

d. Equipped industrial zones. The planned industrial complex (i.e., the complex subject to legal control of location and possibly of technology) presupposes a certain policy of economic development that may be expressed in negative and positive terms. Negative control includes the prohibition of industrial establishments outside the areas set aside for that purpose in the land-use plan; this is the principle set forth in the projected master plan. More important is positive control, which manifests itself in operative intervention; this includes the two different forms of direct intervention and incentive for the industrial location of complexes in specified places.

Direct intervention is typical of countries with a planned economy and is exclusively followed in the U.S.S.R. The intermittent use of direct intervention also occurs in countries with free-market economies, falling as much within the powers of state intervention as within the management of the monopolistic and oligopolistic organizations. It is part of the political instrumentalization in countries with planned mixed economies. The guiding and propelling action in such countries, however, most often takes the form of incentives.

Experience shows that negative control can achieve operative efficacy only if the entire national territory is controlled by ordinances of equal juridical and technical validity, since speculators are otherwise permitted to maneuver in nonplanned suburban or external zones in such a way as to defeat competitively the zones of designated use. This occurred in the 1950s in the metropolitan areas of Turin and Milan. However, active intervention, either direct or based on incentive, will immediately achieve the specific objectives in view. This is shown not only by the industrial planning of the department of Kraków in Poland, for example, but also by the industrial development policy pursued in England since 1934, on which were subsequently modeled the planned interventions in the

industrial field in France (1950) and Belgium (1962); the English policy has also inspired, if only formally and therefore inefficaciously, the policy of industrialization in southern Italy since 1959.

The English policy for economic development in areas with unemployment or in danger of unemployment is based on a substantial series of legislative measures, such as the Special Areas Development and Improvement Act of 1934 and its later supplements, as well as the Distribution of Industry Acts of 1945, 1950, and 1958. The policy is firmly interpenetrated with urban planning, so that every installation in the master plan of industrial locations with a land coverage greater than 5,000 sq. ft. must be authorized by the Board of Trade. Since 1934 the policy has functioned in an area equal to 8.8 per cent of the territory of Great Britain and has affected about 18 per cent of the population. As a result, many equipped industrial zones have been established, and industrial nuclei with works built at state expense have been rented out. The industrial zones consist of trading or industrial estates, among them the famous 700-acre Team Valley Estate (PL. 179), designed by the architect William Holford, which was founded in 1936 at Gateshead, across the river from Newcastle upon Tyne. The English policy has shown itself to be by far the most effective incentive for attracting industries to specific regions, according to Alix Meynell, former Undersecretary of the Board of Trade (*Location of Industry*, London, 1959).

This method of industrial incentive toward economic development is an effective instrument for establishing good working conditions in an esthetic and psychologically acceptable environment and for substantially modifying the industrial landscape. The trend has also been followed in other countries, such as Germany and France. In the United States this trend experienced special and significant progress during the early 1960s with the decentralization of individual industrial works and the concentration of groups of related industries in vast and well-organized industrial parks; these are conveniently located with respect to the highways and are linked together in a territorial framework. The most notable example of this development is the chain of industrial parks around Boston on Route 128, including the New England Industrial Center, the Waltham Research and Development Park, and the Waltham Industrial Center (PL. 179). It constitutes the embryo of a new territorial organization of high quality, with working areas located on particularly pleasant sites and articulated with large expressway networks.

In Italy the Olivetti complexes at Ivrea (PL. 179) and Pozzuoli are commendable from the point of view of spatial organization and public facilities. The development of specialized industrial zones such as those of Marghera, however, continues according to antiquated criteria of mere grouping within a region, while the large majority of industrial complexes in the development areas has continued to decentralize and reconcentrate with no attempt at rationalization. In the south of Italy, apart from instances of direct state intervention (e.g., large iron and steel works of Italsider in Taranto) or rare cases of excellent establishments built by private groups, attempts to create planned industrial complexes have produced negative results, especially from the point of view of urban planning and regional organization. The will to plan, to control, and to coordinate was lacking. The most disappointing evidence of this was the inability to begin work on the plan for development of the industrial area of Taranto (1962). This was the first plan to be prepared within the framework of the 1959 law on industrialization, and it had the benefit of favorable conditions such as a huge reserve of land at very low cost and the motivation provided by the presence of a powerful industry. It becomes evident from these data that the planning of industrial establishments holds great interest and contains definite advantages for those countries which can turn to account the evolutionary possibilities for determining the character and localization of industrial complexes.

e. Public recreation facilities. New urban living habits arising in part from the rhythm of the short work week and annual vacations have since 1945 gradually augmented the demand for public recreational facilities. This is expressed in increased hotel vacation facilities, sometimes in the possession of two residences, and in a growing need in the urban areas for parks, promenades, and mass sport and recreational establishments. This demand results in large extensions of urban areas and structurally modifies the living environment so as to require preventive planning and suitable financial and administrative measures. In this respect, too, Amsterdam preceded other cities. In 1929 Amsterdam planned a large artificial wood, the Amsterdamse Bos (executed 1931–40), situated south of the city and extending over 1,400 acres. In Vienna an imposing network of public facilities was constructed for popular culture and diversion. In the 1950s Hamburg set aside two long strips of green space along the banks of the Alster and Elbe rivers for pedestrian promenades, each 12 mi. long. Also Moscow has an equipped recreational area of more than 12,000 acres in the northwestern section of the city. Within its own municipal territory Stockholm owns more than 14,800 acres of land (i.e., one-third of the whole) permanently zoned for parks, natural reserves, and sport facilities; the sport facilities alone cover 1,000 acres, equal to 53 sq. ft. per inhabitant. Outside the administrative limits of the city, Stockholm owns an additional 39,500 acres of woods intended for recreation (about 2,100 sq. ft. per inhabitant). In 1965 the city of Oslo owned some 480 sq. ft. of land per inhabitant equipped for sports, excluding wooded land and promenades. Compared with these cities, Genoa with its 16 sq. ft. of public green space per inhabitant, and Rome and Milan with 21 sq. ft. per inhabitant, offer very modest recreational facilities. After establishing city parks in the 19th century and the beginning of the 20th, Italy did nothing more in this field.

In addition to the more strictly urban requirements for public recreation, there are various needs on a regional and national level, including public facilities in natural parks and tourist areas in attractive landscape surroundings. Here, too, there are excellent examples. Denmark zoned its entire national territory in 1962, reserving 43 per cent of the total area of the country (i.e., 7,300 sq. mi.) for national parks, promenades, recreational areas, and summer residences. In Holland, where available land is scarce, prudent territorial plans specify in detail the particular features to be protected: interesting landscape areas, boundaries, paths, canals, and certain rural areas. Whatever could be salvaged for recreation and leisure was set aside within the manmade and essentially utilitarian landscape. In England there are some 7,000 sq. mi. of national parks, equal to one-eighth the total area of England and Wales. Almost as much area of restricted green belts has been established for the protection of the principal metropolitan areas.

Undoubtedly the improvement of the Mediterranean coastal areas and the Alpine mountain regions, owing to the tourist industry, occurred in extremely difficult evironmental conditions. Perhaps in no other European country has there been such irreparable destruction of landscape through a lack of self-discipline as in Italy. Among the rare exceptions, which are therefore even more laudable, is the vacation village of Eni at Borca di Cadore (architect Eduardo Gellner, 1958). The recovery of what can still be salvaged has become a necessary way of making amends. There have been some initial steps in this direction. The 1963 economic development plan for Umbria, for example, includes a proposal to use the smaller medieval complexes, otherwise destined to complete neglect, as public facilities for recreation.

The problem of public facilities for recreation is also a collective and spatial problem, and it therefore concerns town planning. The solution can come only through active intervention and, in certain cases, through vigorous forms of control proportionate to collective incapacity for self-discipline.

Plans for the future. From this review of the main problems relative to the basic elements of the urban complex, and from the references to recent situations and tendencies in planning and performance, there emerges the strong necessity for an over-all view of the problems, without which it is impossible

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

to attain a balanced and unified solution. Possible choices for urban development are obviously related to traffic solutions, to decisions concerning the central cities and renewal of the preexisting urban fabric, and to the policy of spatial distribution of industrial complexes. What is most important for comprehensive economic and social efficiency, in an urban complex as well as in a territorial context, is the interrelationship between the structural elements of the whole. Each of the elements comes into play in terms of quantity and quality as the functionalists predicted; but primarily their actual spatial distributions become apparent in the numerous possible combinations, as well as in the ways these combinations affect the structural and consequent human interrelationships.

Today the question of static and crystallized socioeconomic phenomena, as in the preindustrial agricultural economies, is no longer pertinent. The balance between the preindustrial population and its resources could be easily reached and maintained or, if necessary, adjusted to various levels of evolution in techniques. The relative regional and local urban structure could therefore remain unaltered for long periods or be modified from time to time in successive leaps. Contemporary socioeconomic and urban phenomena, however, are essentially dynamic and fluid. The attainment or maintenance of a degree of satisfactory coherence can be guaranteed only by the most balanced and continuous development possible. This development must be consistent with the potentialities of the existing establishment, when at best the urban complex has already attained an intrinsic efficiency and balance and contains adequate reserves for the requirements of expansion; or it must be obtained by means of the maximum use of selected endogenous energies, with the stimulation of initiatives that are weak or latent but concurrent with the process of development and/or with the preventive limitation of forces that are superabundant or distorting; or it must be obtained by means of direct intervention for the timely grafting of exogenous solutions. The integrity of the territorial base demands an integrated master plan capable of guaranteeing the attainment of an efficient and balanced state and the continuity of balanced development. The fragmentation of the comprehensive plan into local plans or plans for various administrative levels may be useful for operational purposes, but it can have no value other than an instrumental one. However, by starting from a series of local and functional plans conceived individually and in terms of special interests, it is almost impossible to compose a unified plan that is homogeneous and coherent merely through successive amalgamations or coordination of the separate plans. Serious recomposition requires a long, repetitive process of compromise that permits the gradual elimination of internal contradictions between sectors. In order to carry out this process, however, the laws of internal coherence must be formulated beforehand and the target of the plan must already be developed, so that such laws can be applied to it.

The attempt to realize a master plan through a mosaic of local and functional plans (by juxtaposition, coordination, and verification of internal coherence) may constitute the first stage of a conceptual approach to master planning through an integration of parts and a rationalization of the system. In this first stage the major internal incompatibilities would be eliminated and the functionality of the system itself would increase. Some attempts have been made in this direction on a territorial level — for example, in the case of municipal plans that call for coordination under regional plans for communications and industrial complexes. Experience shows, however, that these attempts generally lead to failure owing to the lack of a common denominator (i.e., general principles and point of view) and to the lack of integration between possible technical solutions and economic realities. The master plan at the city level has long been recognized and applied as an instrument for the integration of various neighborhood and institutional plans (e.g., plans for capital improvement, location of industry, transportation, recreation, redevelopment of the central city or slum areas) and as an over-all scheme to compose the various local problems within a unity; similarly, on the territorial, regional, or supercommunal level, the need for a coherent, integrated master plan is gradually being recognized and applied. In other words, the step that town planning is taking everywhere and on all levels is from planning of a functional type (simple rationalization of the system) to planning of an organic type. This is the second and decisive stage, in which planning aims at systematically organizing or reorganizing structures and their functioning. At this stage the plan is submitted as an over-all creative scheme equipped with a central principle; its coherent development guarantees the internal compatibility between the parts and the compatibility of the parts with the whole. The plan at this stage is necessarily one and continuous and can only be expressed in operative terms — that of presiding over city planning and socioeconomic and urban development, of which it represents the conscious structural form.

In the formulation of a plan, from the technical, administrative, and economic points of view, it is therefore necessary to determine from the start what type of plan is to be specified: an organic structural plan, a strictly functional plan, or a plan with built-in indefiniteness that may be equally poor in ideas and operative force. This last type characterized the failure of town planning in the 1950s in certain countries. The specification is indispensable because different techniques and methodologies and different technical-juridical instruments of execution correspond to the various plans; it is, after all, the instruments that must be subordinated to the ends. To establish unattainable goals with inadequate instruments is certainly foolish and inefficient; but to fail to adopt appropriate methodologies, technical and financial means, and juridical instruments is equally absurd.

The conceptual and operative progress toward the goal of organic structural planning, which appears to be the only rational means toward a stable solution of the problems posed by contemporary civilization, is therefore conditioned by parallel and coherent progress in economic planning and in the juridical and administrative sphere. Mistakes are paid for dearly; they signify defeat and annulment even in the case of plans magnificently conceived by notable planners.

Adaptation of means to ends is therefore the primary condition for the practicability of a plan. The second condition is multiple authorship, since a plan, whether it proposes functional rationalization or structural reorganization, can no longer be a single work based on an individual conception, even though that conception results from unusual intuitive gifts. The intuitive method adopted in the personal formation of plans conceived as single works was the first answer to the need for integrated plans; this yielded some valuable results, but they precluded experimental *ex ante* verification. The new methods of comparison between alternative solutions, however, did not exclude the intuitive method of conceiving a unified spatial solution. On the contrary, starting precisely from the latter method in the form of over-all schemes, objective comparison between various schematic spatial solutions became possible with the new methods; the verification of these solutions and their optimum use in economic terms also became possible with all available scientific instruments. This comparison could be made before the definitive and detailed elaboration of the general operative plan. With this methodological integration of intuition and verification, error and inconsistent choices diminish, and the plan itself is rendered efficient as it grows. It becomes less a magnificent vision than a scheme of creative reasoning for the solution most suitable to reality.

If this perspective is not conceptually mistaken, plans thus formulated should be equally immune to presumptuous improvisations, discretionary choices, the tyranny of specialist techniques, and the temptations of escapist utopias that appear from time to time. The plans would provide for all — planners, politicians, and citizens — a common base of reasoning from which choices could be justly and democratically made. The plans would also provide a point of reference from which results could be evaluated and corrections could be made in subsequent short- and long-term programs. They would then become, as they already have in some countries, a serious, prudent, slow, but continuous work of creation and verification, conducted without excessive pessimism or optimism, but with steady conviction.

Giuseppe Samonà speculated on the development of urban planning when, at the height of anxiety and hope, he wrote (1959): "Men and structures, cities and regions, all involved in a development of events that are still obscure but full to the brim with a vitality unknown before, are thus trapped by a technique that, having overstepped its instrumental limits, tends to penetrate all values and impose itself as a form of defense against the explosive events that henceforth dominate the life of all peoples."

Town planning, the science of the future, is engaged in all latitudes and political regimes in preparing creatively and consciously the conditions of life for the future, foreseeing the scope, structure, and form of urbanization; thus it aspires to be recognized as the collective art par excellence. Its success will depend upon the extent to which it becomes a primary pursuit in community living.

TRAGEDY AND THE SUBLIME. Certain aspects of reality or fantasy, or events and figures that transcend the normal or the rational, provoke a strong and more or less instinctive emotional reaction that, together with its critical evaluation, constitutes that particular esthetic experience which is usually defined as "sublime." According to modern theorists of the sublime this experience is based, above all, on the ambivalence of the sense of attraction and repulsion and thus differs from, when it does not directly contradict, the concept of the pleasingly "beautiful." As such, the esthetics of the sublime was a fundamental element not only of the anticlassical reaction of the 18th century but also of that romantic vision of antiquity which found its most lofty and coherent formulation in that and the following century. The feeling of dismay in the face of the unknown, the grandiose, or the inevitable (see DEMONOLOGY; DIVINITIES; MAGIC; MONSTROUS AND IMAGINARY SUBJECTS; TERROR AND THE MALIGN) has been, however, a source of creative inspiration, particularly within the religious sphere, in every period of history. It constitutes one of the dominant themes in the birth and development of tragedy (which was regulated by precise rules that the sublime tended to escape); nor are aspects and reflections of the tragic lacking in the religious and secular manifestations of the representational arts, although these cannot be classified in a clearly defined thematic category (see ESCHATOLOGY; HISTORICAL SUBJECTS; MYTH AND FABLE; etc.).

SUMMARY. The tragic in art (col. 264). The concept of the sublime and its development from antiquity to the 18th century (col. 268). The esthetics of the sublime in the 18th and 19th centuries (col. 270).

THE TRAGIC IN ART. It is difficult, at first sight, to identify a specifically tragic tradition, whether iconographic or stylistic. The tragic would seem, on the one hand, because of the nobility of its themes, to share the tradition of historical subjects (with a theoretical basis principally inspired by the *Poetics* of Aristotle), and on the other hand to be associated with that of the tradition of the sublime (see below). Direct relationships between tragedy and art are nonetheless discernible in various periods of Western civilization and generally determine varying mutations, whether in the style of narrative, the expression of sentiments, or the choice of subjects.

At this point another difficulty arises. The term "tragic" has assumed a wide range of meaning: on the one hand it indicates the actual dramatic structure according to the Greek model, and on the other hand, the "pathos" that accompanies such a theatrical form. It can be figuratively applied to a somber tale without dialogue and, with equal legitimacy, to a macabre and terrifying scene such as the *Raft of the Medusa* by Géricault (VI, PL. 118). It is associated with the situation, whether poetically or artistically depicted, of man overwhelmed by a boundless landscape that transcends him — a situation that is found, for example, in the landscapes of Caspar David Friedrich (q.v.), where the influence of romantic poetry, particularly of

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

an eschatological and funereal nature, is apparent. Such a situation, however, also forms part — and perhaps more properly so — of the concept of the sublime (see below).

The essential aspect of the tragic, however, is that of conflict and opposition, even when it is only symbolically achieved by means of the contrast of forms, lights and shadows, and gestures. The introduction of this element — besides being strongly characterizing in nature — also acquires effective historiographic validity, since dramatic contrast, as a theatrical type, does not exist in all civilizations and disappears for long periods (throughout the entire Middle Ages, except for occasional reappearances), while at other times it preserves only a scant and fitful vitality. The tragic in art presents the same historical vicissitudes and in fact follows a parallel development, based on corresponding periods of cultural presence.

For these reasons, the concept of the sublime — which, more broadly, included the monstrous, the awesome, and the sacred — extends to the great representational cycles of the Egyptian tombs that illustrate the journey of the soul in the afterlife as well as to the epic mythology of the Mesopotamian and Greek worlds, where the theme of man's (or man-god's) battle against beasts, monsters, or monstrous divinities recurs as a dominant motif, culminating in the drama of the gigantomachy of the Pergamon altar (VII, PL. 173). A parallel may be drawn with the theme of war and the hunt as expressed in the historical subjects of the ancient Orient and in the monuments of Rome and Sassanian Iran (see HISTORICAL SUBJECTS), although here the tension is attenuated by the secular content or the abstract symbolism of the regal power. In these compositions the sense of majesty and that of ineluctability interweave, and in their "scenic" expression the concepts of the tragic and the sublime are thus superimposed. Tragedy also includes the noble and pathetic aspect of pity for the fallen and the conquered (PL. 182), most consciously expressed in the barbarian figures of historical Roman reliefs.

Where the sense of death as a definite and irrevocable passing is lacking, owing to a particular religious interpretation of the entire cosmic life, the concept of the tragic is attenuated or replaced by other values. The uninterrupted cycles of birth and death, as postulated by the great religious movements of India (except for Islam), reduce the values of majesty and exclude the sense of tragedy (even from the theater). Nor do they permit indulgence in sorrow, which is often deemed a deformation that at the same time is connected with the individual's actions in his preceding lives, thus being a foreseeable and, in a certain sense, desired consequence of voluntary acts. Only the death of the Buddha, in the Hellenistic-Iranian interpretation of northwestern India (see GANDHARA), is described in sorrowful forms, just as notes of sorrowful pathos recur in those episodes of the Buddha's life which indicate the stages of his detachment from his family and the world. These, however, are foreign interpretations that cannot properly be defined as Indian. Moreover, they concern a religion that treats sorrow as one of the basic points of its doctrine, seeking to eliminate it, together with death and old age, from the reality of a world that, in relation to the absolute, is only a shadow.

The scenic-dramatic enucleation of the story in classic Greek art can perhaps be associated with the regularization of actual tragedy (there was a similar development in the 16th and 17th centuries). The relations established between the theater and the representational arts resulted in the dissemination of dramatic subjects, characters, situations (PL. 181), and perhaps even stage costumes (especially between 460 and 400 B.C., that is, up to the time of Euripides). It would be interesting to discover an analogous association in the conquest of a more profound expressiveness, a greater wealth of emotional situation — in the last analysis, of ethos — between Aeschylus, Sophocles, and Euripides and contemporaneous painting and sculpture (see CLASSIC ART); but in spite of the ascertainable contacts, affirmed by ancient sources — Aristotle, for example, declares that Zeuxis (q.v.) is "poor in characters" compared to Polygnotos (q.v.) — the paths seem more divergent than parallel.

In their critical works Johann Joachim Winckelmann and especially Gotthold Lessing, in his *Laokoön* (1766), glimpsed this asynchronism between the theater and the arts. They explained it as essentially a result of the greater idealization of art, certain passions being repugnant to the idea of the beautiful, since, by placing the body in forced postures, they cause the beauty of its ordinary state of repose to disappear. The classical artist, Lessing pointed out, refrained from these postures or reduced them to a lesser grade of expression, so that they were still capable of some beauty. Externalization of the emotions and expressive vehemence proceeded at the same rate in sculpture, however, as in dramatic art. It is also noteworthy that the term (and therefore the related concept of) *mimeisthai* began to be used with reference to actors (by Aristotle, Plato, Xenophon) between the last years of the 5th century B.C. and the first years of the 4th — that is, precisely at the time when the tendency toward expressionism began in the plastic arts. Xenophon relates how Plato accused Parrhasios (q.v.) of not having adequately represented, through the expression of the eyes, the passions of the soul. The conclusion of the development was, so to speak, a synthesis of realism and the sublime, which is to be found later only in the northern European religious painting of the Renaissance and in romanticism.

In the Middle Ages liturgical drama became, by the 11th century, an essential element in the genesis of narrative painting. In the famous Bayeux tapestry, the gestures of the figures are directed toward the spectators in a dramatic manner. Various iconographic motifs in the portrayal of Gospel scenes probably had a theatrical origin, while the Deposition, as early as the St. Albans Psalter, assumed the character of a *tableau vivant*, combining the illusionism of dramatic action with a direct appeal to the emotions. This connection is confirmed by the presence at St. Albans of Geoffrey of Le Mans, a prelate who was greatly interested in the mystery plays. The type of painted cross with the figures of Mary and John at the sides corresponds to a Byzantine dramatic staging, in which the characters recited from behind painted tables. The pathetic element, however, is often lacking in medieval miniatures and frescoes, or rather, is associated with more abstract and stylized forms (see MONSTROUS AND IMAGINARY SUBJECTS, col. 260 ff.). It was only from the 13th century onward, as a result of visionary and prophetic preachings — that is, of a more direct emotionalism — that the sacred scene, throughout almost all of southern Europe, assumed an emotional interest that at times became expressionistic (PL. 182).

The rebirth of tragedy took place in Italy between the 13th and 14th centuries, notably in the Paduan cultural sphere with Albertino Mussato's political drama commemorating the tragic end of the ferocious Ezzelino da Romano. The play is characterized, above all, by a strong opposition of characters and by singularly violent dialogue. It may seem excessive to seek a connection between Mussato and the dramatic plasticity of Giotto (q.v.), whose most perfect expression is to be found in the Scrovegni Chapel in Padua (VI, PLS. 199–203), but it should be remembered that documents connect the chapel with sacred dramatic representations and that some narrative expedients of Giotto have been recognized as having a scenographic origin. The influence of sacred drama is discernible in almost all the painting of the 14th and 15th centuries, both in the setting of the single episodes (within open pavilions, which constituted an evolution from the classical "door" of the proscenium) and in the general tendency toward simultaneity.

In the 16th and 17th centuries a parallelism with tragic drama was generally sought in the representational arts: for example, in the emphasis to be placed on design (assimilated to the dramatic plot), on the study of the expressions ("fury" is often mentioned), on mimicry, and on the direct relation with the spectator in accordance with the famous maxim of Horace (*Ars poetica*, 102–03) regarding the tragic actor: "If you would have me weep, you must first feel grief yourself" (*Si vis me flere, dolendum est primum ipsi tibi*). Around the protagonists, Leonardo da Vinci had already advised the introduction of a chorus of "bystanders" who perform "actions that show admiration, reverence, sorrow, suspicion, fear, bliss, or whatever the situation demands." Toward the end of the 16th century a concern for a rigorous unity of action became apparent in the

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

arts. In his treatise (*Il Figino*) of 1591, Gregorio Comanini declared that a good painter "does not paint diverse actions within a picture, but only one, it being no less unfitting that several subjects be painted in a picture than if two men are seen under the same cloak" (Barocchi, 1962, p. 345); all the images depicted in the painting were to be focused on this single action.

In the frescoes by Luca Signorelli (q.v.; IV, PL. 179; VII, PL. 380; XIII, PLS. 36, 37) in Orvieto and in the frescoes, now destroyed, by Leonardo da Vinci and Michelangelo (qq.v.) in the Palazzo Vecchio in Florence, the emphasis on the passions resulted in a turbulent dissolution of the events depicted — an effect that for other reasons was later sought by the great narrative painters of the baroque period, particularly Rubens (q.v.). This emotional emphasis, combined with the desire to concentrate the entire painted scene in a single moment, led not only to a different interpretation of the drama (from general and cosmic to private and interior) but also to a decisive deepening of psychological content. There is good evidence of these trends in the intensely dramatic sacred scenes of Caravaggio (q.v.), which closely adhere to the unitary prescription of Comanini cited above (III, PLS. 34, 37, 39, 43).

In the 17th century closer relations between tragic drama and painting were established by Nicolas Poussin (q.v.). In many of his works an imitation of the sequence of events of tragedy (from which, moreover, he drew several subjects) is explicit. In his work and in that of the other great French masters of the 17th century, echoes of discussions concerning the unity of place and of action can also be found; but the essential contact lies in the analysis of character, in the states of mind expressed, in the desire to find a constant transition from tranquillity to the greatest excitement and vice versa. Perhaps the desire to find an equivalent for the final catharsis of tragic drama also inspired the wide, Venetian-style landscapes and the well-proportioned classical architecture that contain — or at times even absorb within a natural cycle — man's agitated passions (XI, PLS. 234, 236). Stylistic affinities have also been established with the metaphorical and descriptive language of the great tragic poets of the French baroque period.

In the 18th century, while the theater moved increasingly toward ballet (as is apparent from Lessing's *Hamburgische Dramaturgie* of 1766), engraving and painting seemed to exploit the possibility of a harsher and more direct realism in order to take on both the emotional and the didactic aims of tragedy. The most notable examples of this development are the series of prints by Hogarth (q.v.) that are structurally inspired by the stage and end in terrifying catastrophes: the *Four Stages of Cruelty*, *A Rake's Progress* (Br. Mus.), etc. Hogarth's connections with the theater are so well known that further comment is unnecessary. In another social climate, Goya (q.v.) had similar connections with actors and dramatists. This was during the years of the rediscovery of mannerist tragedy and of Shakespeare, whose tragedies were strikingly illustrated by Henry Fuseli (q.v.; PL. 187). The pictorial "tragedies" of this period are characterized by a growing adherence to daily life and anticipate not only Victor Hugo's famous preface to *Cromwell* — which would seem, in a sense, a commentary on the artistic philosophy of a painter like Géricault (q.v.), since it asserts that reality results from the completely natural combination of the sublime with the grotesque — but also the activity of the realist theater of André Antoine (who was in contact with students of Courbet).

More than theories it was the tragic experiences of World War I that drew attention to the images of mankind's sufferings and revolts. Michelangelo and Tintoretto, Grünewald and El Greco, the mannerists of Italy and the Low Countries, were dramatically reevaluated, owing chiefly to the influence of Max Dvořák (1874–1921). In architecture too, primarily through the efforts of Eric Mendelsohn (q.v.; V, PLS. 104, 105), a deep and exciting emphasis was sought. In fact, it could well be said that, beginning with expressionism, the whole of modern art has developed in a tragic, if not apocalyptic, vein — from the drawings of George Grosz (XI, PL. 446; XII, PL. 572) to Picasso's *Guernica* (VII, PL. 278). Realism, at least up to Ben Shahn (q.v.), has acquired a much more profound participation in human sorrows, notwithstanding the desire to transfer daily happenings to an existential or absolute plane. Even when reference to the natural has been absent, this commitment has not ceased; indeed, almost all critics agree in recognizing that *art informel* has a strong capacity to express the desire for "salvation" and the terror of the "fall" (G. C. Argan, "Salvezza e caduta nell'arte moderna," *Il Verri*, No. 3, June, 1961). In the summer of 1963 an exhibition dedicated to anguish was organized at Darmstadt ("Zeugnisse der Angst in der modernen Kunst"), which included works by Ossip Zadkine, Max Ernst, and Umberto Mastroianni.

It is evident that there is a problem of communication in expressing precise tragic content through *art informel* in a form that is not simply metaphorical. Almost every important monument dedicated to the European resistance to Nazism has given rise to considerable perplexity and to the adoption of banal symbols such as laceration, twisting, the sinking hook, the thorn that wounds, wringing hands. Henry Moore, commenting on the results of an international contest for a monument to the victims of the Auschwitz concentration camp, emphasized the great difficulty of creating a monument that would express the emotion aroused by crime of such stupefying dimensions. Attempts to design such monuments met with similar results in almost all countries (except in the case of monuments of an exclusively architectural character, which thus evaded the theme of the tragic).

It is to be hoped that the "new realism" — linked, through the work of such artists as Francis Bacon, to the English tradition, which has never abandoned its tragic vocation — or perhaps "pop" art, capable often of an intense portrayal of the contemporary human situation, or other modern movements may succeed in reestablishing a link with the theater, which, for its part, should take more account of the stylistic developments of modern culture.

Eugenio BATTISTI

THE CONCEPT OF THE SUBLIME AND ITS DEVELOPMENT FROM ANTIQUITY TO THE 18TH CENTURY. In esthetic criticism the concept of the sublime is connected with that feeling of ambivalent pleasure — of attraction and fear — which the reader or the observer derives from works whose subject or whose form transcends the proportions of human measure and circumstance. This effect is obviously achieved by images and scenes that are unreal or deliberately awe-inspiring (see MONSTROUS AND IMAGINARY SUBJECTS; TERROR AND THE MALIGN). Similarly an architectural structure that because of its vastness or its violent contrasts of light and shadow stirs a sense of foreboding and tension that generates the same esthetic pleasure may be characterized as sublime; and the term "sublime" has also been widely used in literary descriptions of natural landscapes and in criticism of landscape painting to designate tormented landscapes, full of contrasts and dramatic qualities (see LANDSCAPE IN ART) — in fact, it is precisely in certain aspects of landscape (storms at sea, dark forests, precipitous cliffs, deserts) that almost all theoreticians of the sublime, including Kant, most frequently found examples to illustrate their definitions. These are settings in which nature weighs overwhelmingly upon man, as in the landscapes of Joachim Patinir (q.v.; V, PL. 296), Salvator Rosa (q.v.), and Alessandro Magnasco (q.v.; IX, PL. 264). Ruins, too, whether real or artificial, are significant in that they inspire a sense of the destructive rapacity of time as well as an attempt to dominate this sense with the mind. In all these meanings, the concept of the sublime was frequently associated with the paintings of Salvator Rosa, the first to reveal the poetry of wild and deserted nature, in which man rediscovers himself (PL. 183; IX, PL. 16; XI, PL. 149); it was then associated with many other painters, including Rembrandt (q.v.; XI, PL. 458) and Rubens (q.v.; IX, PL. 19; XII, PL. 332), and with the etchings of Piranesi (q.v.; V, PL. 241). This typically preromantic esthetic ideal strongly influenced the painting of visionary artists such as William Blake (q.v.; PL. 187) and William Turner (q.v.; PLS. 223–225), as well as the works of neoclassic artists such as Fuseli (PL. 187) and John Runciman (PL. 188) whose interpretation of antiquity was full of fantasy and emotion. Many

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

landscape painters, from Richard Wilson (PL. 183) to John Martin (PL. 185) and Arnold Böcklin (q.v.; PL. 188), pursued a "sublime" vision of natural scenery.

In many artistic trends the study of landscape and nature readily touches on the relationship between man and nature, underlining the disparity that exists between the immensity and crushing force of nature and the smallness of man, who nonetheless realizes, with his intelligence and sensitivity, the sublime beauty of the blind forces which loom over him and which he dares to challenge. In the Buddhist symbolism of the Ch'an sect (Jap., Zen) the contrast between nature, in its immensity, or rather, immeasurability, and the small human images that it dominates is without doubt pervaded by a tragic, and at the same time romantic, note referable to the power of the extreme forces from which man may definitively free himself only by that divine spark which constitutes the human spirit (see BUDDHISM). In this case, for the Chinese artist, the tragic and the sublime coincide, albeit as complementary aspects of a reality to be overcome.

Although the esthetic idea of the sublime, in all the aspects that have been enumerated, is present in the art, criticism, and poetics of all periods and of all countries (see CRITICISM; ESTHETICS), its conceptual determination and definition, with the corresponding use of the term "sublime," is found only in certain phases of the history of art and esthetics. On one hand, therefore, the history of the sublime coincides with the history of explicit knowledge and positive appreciation, of awe-inspiring phenomena artistically represented, of the gigantic, of ornamentation used with the aim of amazing, haunting, and almost forcing the observer's spirit beyond rationally intelligible experience, of deformation intentionally pursued so as to express a dramatic vision of reality. On the other hand, in a more exact and rigorous sense, the history of the sublime presents itself as a reconstruction of the deliberate use of this term to define a particular esthetic category that is distinct from the "beautiful" as used in a restrictive sense to designate not the quality, the esthetic value as such, but the theory of clear, balanced, harmonious forms that give the observer a sense of spiritual serenity.

The sense of the sublime, as something distinct from the beautiful although with occasional strong connections, almost always recurs when the divinity is presented in such forms as to arouse in the beholder the tremendous shock of contact with the metaphysical world. This element, sought after and desired by artists of every period and every country, is often tinged with a quality of terror (see TERROR AND THE MALIGN); but at other times the artist is inspired solely by the *maiestas* of the god, creating an image of the divinity which is both mystical and fantastic and which arouses in the beholder a sense of awe that coincides with the sublime. This occurs in medieval Christian art, in the works of Fra Angelico (q.v.), and above all in Buddhist art inspired by the meditative techniques of Yoga.

The history of the implicit theories on the sublime should begin with Aristotle's *Poetics*, which, in opposition to the Platonic condemnation of the mimesis of the "ugly," declared that the representation of phenomena arousing pity and terror is capable of freeing and elevating the soul; but explicit theorization begins with the anonymous treatise *On the Sublime* (Περὶ Ὕψους), the rhetorical treatise that first defined the sublime. This is a text dating from the 1st century of the Christian Era, supposedly edited by a Greek of Hebrew origin; it is in epistolary form and of controversial character, originating from the dispute between the Apollodorians (followers of Apollodorus of Athens) and the Theodorians (followers of Theodorus of Gadara) referred to by Quintilian in Book III of his *Institutio oratoria*. The Apollodorians professed a rationalistic and demonstrative ideal of rhetorical art, while the Theodorians gave major importance to the pathetic element, to suggestion, and to fantasy. The treatise undertakes to show how the oratorical sublime, by means of a certain nobility of expression, can elevate the soul of the hearer not only to a state of persuasion but to feelings of ecstasy, joy, and pride.

The treatise *On the Sublime* was transcribed many times in the Byzantine period and was attributed, after the 10th century, to Dionysius of Halicarnassus or to Cassius Longinus. It made its entrance into Western civilization in 1554, when Francesco Robortelli published it at Basel, attributing it to a hypothetical Dionysius Longinus. Its European career, however, began only in 1694, when Boileau, the theorist of French classicism, edited a French translation preceded by ten essays entitled *Reflexions critiques sur quelques passages du rhéteur Longin*. The influence of the treatise was chiefly apparent, however, not in Continental Europe but in English culture. As early as 1636 the first English edition had appeared, and by 1700 the work was known to all the cultured English public, not only through Boileau's translation but also through a number of English translations.

THE ESTHETICS OF THE SUBLIME IN THE 18TH AND 19TH CENTURIES. It was in England in the 18th century that the concept of the sublime received its first theoretical formulations, with applications both to poetry and to the figural arts. Among the earliest of these formulations (although the sublime is not referred to as such) are those of Joseph Addison (1712) and George Berkeley (1713), which form a fundamental guide to 18th-century taste. In the essays dedicated to the pleasures of the imagination that occupied Nos. 409–21 of the *Spectator*, Addison, with frequent references to the treatise of the pseudo Longinus, carefully analyzed the pleasure of the sublime. In the second essay he described the sense of spiritual calm that comes from the contemplation of vastness, especially boundless panoramas such as stormy seas, starry skies, and spacious, varied landscapes. In the fifth essay he applied these concepts to the esthetic evaluation of architectural works, in which the sublime consists in the grandeur either of the bulk of the buildings or of the style of construction. In the eighth essay he discussed another aspect of the sublime: the pleasure which the reader derives from a terrifying description and which springs from his awareness that he need not fear the objects described. It is this aspect of the sublime that is concisely defined by Berkeley in the second dialogue between Hylas and Philonous, when the latter observes that our souls are filled with a "pleasing horror" at the sight of the vast depths of the ocean, or of some towering mountain whose peak is lost among the clouds, or of a dark, ancient forest.

It was Edmund Burke who, in his *Philosophical Enquiry into the Origin of Our Ideas of the Sublime and the Beautiful*, published in 1756, first rigorously defined the empiricist concept of the sublime. His theories on the sublime gained wide acceptance in English cultural circles of the 18th century. He defined the beautiful as inspiring feelings of tenderness and affection, while the sublime arouses feelings of gloom and terror. In Burke's description of the awe evoked by the sublime, the memory of the ecstasy spoken of by the pseudo Longinus at the beginning of the treatise *On the Sublime* is evident. Burke says, of this ecstasy, that it is not produced by rational thought but anticipates and stimulates it irresistibly. In this violence of emotion that precedes rational thought lies one of the reasons why the sublime, in precisely the sensist definition given it by Burke, was to occupy a central place in the theory and criticism of the romantics.

After defining the general idea of the sublime, Burke proceeds to an analysis of its various aspects and of the factors that contribute to rendering a work of art sublime. In the first place, the representation of objects that, in nature, provoke terror either through the vastness of their dimensions or through their inherent menace can be characterized as sublime (see MONSTROUS AND IMAGINARY SUBJECTS). Sublime, too, is the obscurity that helps to render an object terrible. Other coefficients of the sublime, according to Burke, are power (and therefore the representation of objects whose power inspires a sense of terror); vastness of dimensions; artificial infinity, as he calls it — that is, the illusion of the infinite obtained by the repetition and uniformity of the parts (this, together with vastness of dimensions, contributes to architectural sublimity); and well-ordered magnificence.

For Burke, the relationship between light and darkness is a further factor in sublimity in architecture. "All edifices cal-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

culated to produce an idea of the sublime ought rather to be dark and gloomy, and this for two reasons; the first is that darkness itself . . . is known by experience to have a greater effect on the passions than light. The second is, that to make an object very striking, we should make it as different as possible from the objects with which we have been immediately conversant; when therefore you enter a building, . . . to make the transition thoroughly striking, you ought to pass from the greatest light, to as much darkness as is consistent with the uses of architecture" (Part II, Sec. xv). An architectural work, to be sublime, must also be almost completely bare: gilding, mosaics, paintings, and statues contribute little to architectural sublimity. Burke recommends bearing in mind that everything that is luminous and gay diminishes the effect of the sublime. He does not seem to concede sublimity to Gothic architecture, which Addison had already qualified as a miserable style in spite of its material greatness. According to Burke, a multiplication of angles detracts from the sublime quality of a building, since its result is that "the whole must of course assume a broken, unconnected figure; the lights must be unequal, here strong, and there weak; without that noble gradation, which the perspective always effects on parts disposed uninterruptedly in a right line" (Part II, Sec. ix).

Colors, whether in nature or in painting, can be considered as contributing to the sublime, according to Burke, who observes that a green mountain is not sublime, whereas a tenebrous mountain is, just as a clouded sky is more sublime than a clear one and the night more sublime than the day. On the grounds that obscurity — and therefore the indeterminate quality of the object represented — is a source of the sublime, while clarity is not, Burke passes unfavorable judgment on the clear pictorial representation of horrible or repugnant subjects. With a probable allusion to the *diableries* of the Flemish painters, he adds: "All the designs I have chanced to meet of the temptation of St. Anthony were rather a sort of odd, wild grotesque, than anything capable of producing a serious passion" (Part II, Sec. iv).

Inasmuch as the pleasure of the sublime was not a pure pleasure but was mixed with pain, it came to be placed in opposition to the pleasure of the beautiful. And it was precisely this antithesis of the sublime and the beautiful — which saw in the sublime not a negation of the beautiful but a positive esthetic value — that was to induce Kant, who knew the work of Burke, to set himself the philosophical problem of the sublime as contrary but not contradictory to the beautiful. The first work in which Kant discussed the sublime, the *Observations on the Feeling of the Beautiful and the Sublime*, dates from 1764. In this work, the difference between the beautiful and the sublime, which had been empirically established by Burke and other English writers, was analyzed dialectically by Kant in such a way as to eliminate, on the level of speculative assumptions, such premises as the neoclassical one that the sublime was the antithesis of the beautiful and hence was to be identified with the ugly.

In the *Observations*, Kant's investigation of the beautiful and the sublime is limited to the psychological level; its object is merely to show how the diversity of the beautiful and the sublime rests on differences of physiopsychological constitution, of sex, and of national character. He provided a quite different speculative foundation for the distinction between the beautiful and the sublime at the height of his philosophical maturity, when he approached esthetic problems critically and wrote the *Critique of Judgement*, first published in 1790 (see ESTHETICS); the treatment of the sublime occupies the entire second book ("Analysis of the Sublime") of the first part ("Critique of Esthetic Judgement"). It begins by establishing the fundamental principle of the *Critique of Judgement*, namely, that esthetic pleasure (contrary to the opinion of Burke and of the English empiricists in general) does not depend on the sensations. According to this work the difference between the beautiful and the sublime consists in the fact that the beautiful produces a feeling of exaltation of life, while the sublime is connected with a suspension, followed by a stronger effusion, of the vital forces. Like the beautiful, however, the sublime produces a universal, disinterested pleasure.

Kant's sublime, as opposed to the beautiful, has two aspects, which he calls the mathematical sublime and the dynamical sublime. The mathematical sublime, through its immeasurable vastness, terrifies and dismays; but it also inspires pleasure (which for Kant, too, is fundamental to the concept of the sublime) through an awareness of the spirit's faculty to go beyond every measure of the senses, through "a feeling of our possessing a pure and self-sufficient reason, or a faculty for the estimation of magnitude, whose preeminence can only be made intuitively evident by the inadequacy of that faculty which, in the presentation of magnitudes (of objects of sense), is itself unbounded" (Eng. trans., J. C. Meredith, p. 502). In what Kant calls the dynamical sublime, the contemplation of scenes that arouse terror (which in nature may be overhanging rocks, as depicted by Salvator Rosa; storms, as in Gaspard Dughet's paintings; volcanoes in eruption; a tempest at sea, recalling Turner; the cataracts of a great river, such as Constable painted), when the observer himself is safe and therefore the danger is represented as merely possible and not real, heightens man's spiritual forces and reveals his superiority, as a rational being, over a nature that menaces only his natural being. "Sublimity, therefore, does not reside in any of the things of nature, but only in our own mind, insofar as we may become conscious of our superiority over nature within, and thus also over nature without us (as exerting influence upon us). . . . The proper mental mood for a feeling of the sublime postulates the mind's susceptibility for ideas, since it is precisely in the failure of nature to attain to these . . . that there is something forbidding to sensibility, but which, for all that, has an attraction for us" (p. 504) and which clearly manifests the command that reason exercises over sensibility. The esthetic criticism of romanticism was to profit from this Kantian definition: for the romantics, artistic images were symbols of ideas, and their validity increased the more they rendered attractive to reason what was terrible to sensibility.

The first to comment on and develop the theories of Kant concerning the sublime was Friedrich von Schiller, who in 1792–93 published his essay on the sublime ("Vom Erhabenen") in the magazine *Neue Thalia*, of which he was the editor. The essay begins with an accurate paraphrase of the Kantian definitions but develops Kant's argument with surer and more penetrating artistic references, extending the concept of the sublime to the artistic representation of passion, suffering, and pain and observing that it is not the feeling of security produced by the representation of others' sufferings that is the source of the sublime and of the pleasure that it engenders, but rather the consciousness of our moral liberty, from which the "pathetic sublime" originates. The pathetic sublime consists in feeling that "our moral being is delivered from the causality of this suffering and therefore from its influence on the determination of our will." On the basis of these premises, Schiller concludes his essay on the sublime by stating those laws which, for him, are fundamental to all tragic art and hence are valid not only for the drama but also for painting and sculpture. These are (1) the representation of suffering nature and (2) the representation of moral liberty in suffering.

In his treatise on esthetics entitled *Kalligone* (1800), J. G. Herder submits the theory of the sublime contained in the *Critique of Judgement* to severe criticism and in a note praises the *Observations on the Feeling of the Beautiful and the Sublime*. He finds Burke's work of great merit, emphasizing its derivation from the Newtonian principles of attraction (the beautiful) and repulsion (the sublime). The principal objection that Herder makes to the concept of the sublime as stated by Kant concerns the transcendental foundation and the contrasting of the sublime and the beautiful, which he finds erroneous also in Burke. Herder considers that the beautiful and the sublime "are not opposites, but the trunk and branches of a single tree whose top is the beautiful in its most sublime form," and he adds that "the feeling of the sublime is the beginning and end of the realm of the beautiful." Herder's ideal is the reconciliation or conjunction of the beautiful and the sublime. The feeling of the sublime, Herder concludes, "is an expanding of our breasts, a looking and a straining aloft, an exalting of our being.

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

To search for the sublime in the night and in the mist, in the inferno and the abyss, in the horrible and terrifying, or even in the formless, and there to lose oneself by becoming oneself formless is a confusion of concepts, just as it is a confusion of feelings to transform into a battle of Titans the beatific sensation of feeling oneself rise above oneself." In an exposition of the sublime in art, Herder points out that the sublime is always united with the beautiful in its highest expressions. In Greek architecture, which joined the one and the multiple, "when the impression of the One is stronger, the building appears more sublime to us; when the impression of the multiple prevails, the building appears more beautiful to us." Concerning sculpture, Herder observes that its culmination is the sublime. The so-called "sacred style" of the Greeks, he adds, acts on the spirit with an indescribable force and leaves affectation far behind, since with a few forms, often harsh and crude, it creates a strong and solid unity and with it a greatness that taxes the imagination. Simplicity gives force to the image, shapes a vigorous unity, and this is the sublime. In painting, he says, the sublime consists "not in multiplicity, but in unity; not below, in the noisy approbation of the throng, but at the summit, at the point of greatest tranquillity."

Friedrich von Schelling arrived at analogous conclusions on the inseparability of the beautiful and the sublime in his *Philosophie der Kunst* of 1802–03, which marks his separation from the romanticism of Jena. For Schelling, the ideal of the beautiful without sublimity is the ideal of cold and regular form professed by classicism; the ideal of the sublime without beauty is the romantic ideal of a shapeless material, absolute liberty without discipline, chaos. Real beauty, according to Schelling, is the union of liberty and discipline, of the unconscious and the conscious, of the beautiful and the sublime. The sublime is the infinite which shows itself in the particular and which expands beyond the narrowness of a form that imprisons it in its own particularity; the beautiful is the exposition of the particular in the absolute, the rendering absolute of the particular in the formal determination that establishes it as particular.

Georg Wilhelm Hegel, in his posthumous *Philosophy of Fine Art* (1835), gives a historical context to the dialectic relation between the beautiful and the sublime by considering them as two different stages in the historical evolution of art. As his departure point, Hegel adopts the distinction between the beautiful and the sublime formulated by Kant in the *Critique of Judgement* and defines the sublime as the attempt to express the infinite, despite the impossibility of finding anything in the real world that is adequate to such expression. Because of this lack of reference to the real world, the sublime, according to Hegel, is inexpressible by means of the finite and can find expression not in the visual arts, but only through verbal representation — in other words, in poetry. Old Hebrew poetry, the poetry of the Old Testament, is, according to Hegel, the highest expression of the sublime; the iconoclasm of the Hebrew religion (see IMAGES AND ICONOCLASM) is justified, in his opinion, precisely because the Old Testament esthetic ideal was founded on the sublime. Hegel considers that the sublime belongs to symbolic art and that classical art cannot claim to express the sublime. In his analysis, which identifies the various esthetic ideals with the successive stages in the historical evolution of art, the sublime is conceived as a stage of withdrawal, since it is an aspect of symbolic art destined to die with the passage from symbolic to classical art. Classical art gives birth to the representational arts, which, because of their expressive limitations, cannot rise to that representation of the infinite in which the sublime consists.

Hegel's historical approach to the esthetic ideals reflects his sympathetic but nonetheless restrictive attitude to the romantic school, which had made the sublime its ideal, even in the critical evaluation of the visual arts. At the time of Hegel's death, in 1831, the esthetic ideals of romanticism, although extinct in Germany, were in full flower in France. A year earlier, on July 25, 1830, Victor Hugo had begun to write his *Notre Dame de Paris*, in which the critical apologia of Gothic architecture is based on the esthetic idea of the sublime as understood in the two Kantian specifications of the mathematical sublime and the dynamical sublime, with, in addition, an accentuation of the terrible sublime, the macabre, and the monstrous. These concepts of the romantic sublime are graphically expressed in the illustrations chosen by Hugo for the first edition of his novel (the originals are preserved in the Musée Victor-Hugo in Paris). The romantic passion for the sublime, above all under the aspect of the macabre, the terrifying, and the repugnant, was later to be transmitted to the French decadents. It was on the esthetic idea of the sublime that J. K. Huysmans subsequently based his critical interpretation of the Isenheim Altar by Grünewald (1908).

An isolated position, in the first half of the 19th century, was that of A. Schopenhauer, who discussed the sublime in the third book of *The World as Will and Idea* (first published in 1819 but influential only after the revised edition of 1844), dedicating an entire section of his work to it. He defines the feeling of the sublime as originating from the contemplation of objects whose significant form, although stimulating pure contemplation, shows a hostile attitude toward the human will in general, threatening it with a superior force that overcomes all resistance or reduces it to nothing in the face of its own immeasurable greatness. From this point of view Schopenhauer approves and adopts Kant's distinction between the mathematical and the dynamical sublime, although he strips it of every reference to morality. The pleasure of the sublime, therefore, is not derived, as is the pleasure of the beautiful, from a knowledge that frees itself from the will but from the contemplation of the will itself. As an example of the sublime in architecture Schopenhauer indicates the mathematical sublime as it occurs in the interiors of large buildings such as St. Peter's in Rome or St. Paul's in London. These interiors, although small in comparison to the universe, being entirely and directly visible to the observer in all three dimensions, give an impression of size that dwarfs the proportions of the human body. As to sculpture, Schopenhauer, repeating the arguments of Winckelmann and Lessing, denies that it can express the sublime, the essential qualities of this art being, in his view, beauty and grace. Nor is painting adapted to the expression of the sublime, because at its highest level painting, according to Schopenhauer, is not a knowledge of the will but a knowledge of the mind, the "idea" that brings complete resignation and suppression of the will.

Schopenhauer's distinction between the beautiful and the sublime was the last to be formulated in the philosophy of the 19th century. However, although the denomination of the sublime was little used by the theorists and critics of the second half of the 19th century — or, at most, used in a nonspecific sense as a simple characteristic of certain works and certain artists — the purport of the distinction between the beautiful and the sublime endured, although under other designations. It appeared again in the *Birth of Tragedy* (1872), which was written by Nietzsche at twenty-six years of age under the combined influence of Schopenhauer and Wagner. In the *Birth of Tragedy* Nietzsche applies Schopenhauer's dualism of "will" and "idea" to the interpretation of the ancient world. This leads him to distinguish between an "Apollonian" art — clear, serene, of pure idea, whose characteristics correspond to those of the beautiful as it had been defined, in opposition to the sublime, by Burke, Kant, and Schopenhauer — and a "Dionysiac" art inspired by the unconscious and indomitable will, shadowy, intoxicated and intoxicating, corresponding in great part to Schopenhauer's concept of the sublime. In his reference to the ancient world, Nietzsche's distinction between the Apollonian and the Dionysiac is related to the desire to deliver the critical interpretation and evaluation of antiquity from the classicism of Winckelmann to which Lessing and Kant, Schelling and Hegel, and Schopenhauer himself had remained substantially faithful. The philosophical problem, however, that appears in the concluding pages allows of extensive application, equivalent to an actual reestablishment of the concept of the sublime. In fact, Nietzsche sustains, in this early work, that existence and the world appear justified only as an esthetic phenomenon, in which the ugly and the discordant also play

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

their part. This affirmation, which legitimizes, on the esthetic level, those forms which do not correspond to the ideal of the beautiful is equivalent to a philosophical rehabilitation of that duality of the beautiful and the sublime which the Hegelian dialectic had practically eliminated from the esthetics of idealism.

The theory of Heinrich Wölfflin is, like that of Nietzsche, founded on an esthetic dualism intrinsic to the vision of the artist, derived from an analytical consideration of art and its history. In Wölfflin's dualism the beautiful and the sublime are not referred to, his categories applying to vision, not feeling; but in all its pairs (linear and pictorial; superficial and profound; closed forms and open; multiplicity and unity; absolute clarity and relative clarity), one of the two terms, the first, has connotations that allow its inclusion in the traditional category of the beautiful, while the second is usually to be placed in the category of the sublime. Also significant is the fact that the dualism of Wölfflin, before its theoretical and systematic development in his *Principles of Art History*, was slowly elaborated through a process of historical research, whose fundamental stages are marked by the essay *Renaissance und Barock* (1888) and by the study on Dürer (*Die Kunst Albrecht Dürers*, 1905). The old dichotomy of the beautiful and the sublime, founded on the psychology of feeling, becomes in Wölfflin — especially through the influence of the "pure visibility" theory — a dichotomy founded on the psychology of vision.

In a purely philosophical capacity, Benedetto Croce (1901), theorizing on the indivisible unity of the esthetic category and excluding all schematization going beyond the individuality of artistic expression, had meanwhile rigorously excluded any return to the dichotomy of the beautiful and the sublime, asserting that the sublime "is everything that is or will be so called by those who have employed or shall employ this word." Notwithstanding its sharp exclusion by Croce, however, the dualism of the esthetic category reappeared in the esthetic theories and in the art criticism of the first half of the 20th century because of the necessity of critically justifying those tendencies of modern art which are unacceptable from the point of view of the monistic esthetics that, in the last analysis, was founded on a classical conception of the beautiful (see EUROPEAN MODERN MOVEMENTS). Even though the term "sublime" has not returned to general circulation in the current language of esthetics and criticism — though it was used as a category of Byzantine art by P. A. Michelis (1946) — the concept has been implicit in more than a few theories and critical trends. Nor has there been any lack of speculative esthetic theories that have reinstated the old internal distinction of the esthetic category: among them should be mentioned those of Souriau (1929), Calogero (1947), and Dufrenne (1953).

A genuine theory of the sublime as distinct from the beautiful is found in the treatise on esthetics by the German philosopher Nicolai Hartmann (1953), who dedicated an entire section of his work to the sublime and the gracious. According to Hartmann, the sublime is to be found in all fields and not only in esthetics. The esthetic sublime occurs when admiration is accompanied by "distance," the calm contemplation of the object admired, without direct participation in its greatness. Since art is the creation of fictitious appearances, the sublime as found in the appearance created by the artist may be the esthetic sublime, when it is not the form of the work of art as such that is sublime but that which it represents; or it may be the artistic sublime, when the sublimity resides in the formal structure of the work. The artistic sublime occurs in all the arts, with the exception of those which are simply ornamental. In the structure of a work of art, sublimity resides in the more profound strata, whose external manifestation is only partial. For this reason the sublimity of works of art is characterized by the obscure, the undetermined, the mysterious, the deep and unexplored, the abysmal. The sublime thus conceived has, however, a relatively small place in painting, which, when it reaches true sublimity, ceases to be truly pictorial — painting, according to Hartmann, consisting in the palpable magic of color. In the frescoes of Michelangelo in the Sistine Chapel, he observes, the sublime is graphic-sculptural because "perhaps only in this way is it possible to capture the supernatural grandeur of man"; and in the later portraits of Rembrandt color is sacrificed to something more profound, which grasps the essence of man. In sculpture the sublime expresses itself as a great human ideal passing into the superhuman, a visionary intuition fixed in stone, as in the carriage of the head of the Olympian Apollo or in the head of Athena with the Corinthian helmet. In architecture, Hartmann considers that the sublime derives chiefly from monumentality: thus palaces, churches, the temples of antiquity, the towers and walls of cities, may be considered sublime, as well as interiors whose spatial configuration gives an effect of loftiness, such as Gothic cathedrals, with their overwhelming height and vastness. Weight can also be a source of the sublime in architecture, as, for example, in such early Romanesque architecture as the octagon of the Palatine Chapel in Aachen. A pure example of the architectural sublime is to be found, according to Hartmann, in the Doric temple, where the appearance of depth is given by the counterplay of the columns and the entablature. This esthetic definition of Hartmann, based on the formal structure of works of art as such, is the most recent theoretical formulation of the artistic sublime; it shows that the question of the twofold esthetic value of the beautiful and the sublime, far from being obsolete, still merits the attention of philosophical esthetics as well as of militant criticism.

TREATISES. Reflections on art, explicit written criticism, have taken the form of the theoretical or the practical esthetic or technical treatise or have combined these various aspects. Obviously there is a technical and theoretical content also in historical writings (see HISTORIOGRAPHY) and in critical expressions (see CRITICISM) that do not constitute treatises as such; and there is an implicit theoretical content in the work of art itself as well as in the activity of art patrons and collectors, that is, in the orientation of taste (see MUSEUMS AND COLLECTIONS; PATRONAGE). Accepting the fact, then, that treatises cannot be separated from historiography, esthetics, and art criticism, except for extraneous aspects, it is necessary to consider the art literature that took the form of the treatise in order to give it a history and a bibliography.

The treatise on art was predominantly the work of artists, especially during the Renaissance and in the mannerist period. It was only from the 17th century on that a theoretical and technical literature written by nonartists originated and spread, branching into various specialized areas. In the 19th century, with the development of modern criticism and historiography, the literary form of the treatise disappeared, with the exception of handbooks. Later, artists themselves began to explain their principles with a new freedom, sometimes in fragmentary form, sometimes in the form of manifestoes, no longer convinced that art could be confined within a system of teaching. Thus the very purpose of the traditional treatise ceased to exist.

SUMMARY. Antiquity (col. 277). The Byzantine world (col. 280). The Middle Ages (col. 281). The Renaissance and mannerism (col. 286): *The early Renaissance; The High Renaissance; Mannerism; Architectural treatises in the 16th century; The treatise outside Italy.* Artistic theory in the baroque period (col. 293). The 17th century in England, Spain, and the Low Countries (col. 295). The 18th century (col. 297): *England; France; Germany; Italy.* The 19th century (col. 300). Representative treatise writers, 15th–19th century (col. 302): *The Renaissance and mannerism; The 17th and 18th centuries: a) Italy; b) Spain; c) France; d) Low Countries; e) England; f) Germany; The 19th century.* The Eastern world (col. 311): *Islam; India; China.*

ANTIQUITY. Interest in the problems of artistic technique and curiosity about the life and work of the most illustrious artists in the fields of architecture, sculpture, and painting were aroused at a very early date in Greece, almost contemporaneously with the appearance of some of the most significant monuments. Such interest arose, as was logically to be expected, apropos of mathematical and geometrical problems and not from philosophical and esthetic considerations, since the first treatise writers had theoreticopractical and technicoprofessional intentions. Esthetic investigation followed a little later and began to develop in the sphere of dialectic. Unfortunately nothing has been preserved of the older treatises, except for references by later authors. It is a great loss to be no longer able to read them today, since the available information about them sometimes fades away into legend.

One of the oldest treatise writers was certainly that Agatharchos of Samos (5th cent. B.C.) who, according to Vitruvius (*De architectura*, VII, pref. 11), fashioned a stage set for one of the plays of Aeschylus and wrote a work on scenographic perspective that induced the philosophers Anaxagoras and Democritus to take up the theme in their own works, in which they taught that objects painted on a flat surface must be arranged in such a way that "*alia abscedentia, alia prominentia esse videantur*" ("some seem to recede, some to project"). However, this information does not agree with Aristotle (*Poetics*, 1449a, 16), who attributes the introduction of scene painting to Sophocles. With the facts presently available, it is difficult to solve the problem: perhaps Agatharchos prepared a monochromatic stage decoration, while Sophocles's painter, Apollodoros, fashioned a stage decoration in color, obtaining a greater scenographic illusion; and Agatharchos may have given only a commentary on the technique of the landscape or buildings drawn, while Democritus and Anaxagoras may have studied the mathematical principles of perspective. Writings on painting are also attributed to the painter Pamphilos of Amphipolis (Suidas, *Lexicon*, s.v.), master of Apelles and founder of a school of painting at Sikyon (ca. 360 B.C.), where mathematics and geometry were taught as propaedeutics of art (Pliny, *Naturalis historia*, XXXV, 76–77). There were treatise writers for architecture, too; the principal ones are listed by Vitruvius (op. cit., VIII, pref. 12): Silenos (?), on the proportions of the Doric order; Theodoros of Samos, on Polycrates's Temple of Hera at Samos — the same Theodoros who supposedly also contributed to the Artemision at Ephesus (Diogenes Laertius, *Lives*, II, 103) and discovered, with his father, the way to cast bronze statues (Pausanias, *Periegesis of Greece*, VIII, Ch. XIV, 8, X, Ch. XXXVIII, 6); Chersiphron of Knossos and his son Metagenes, on the Artemision at Ephesus (Pliny, op. cit., XXXVI, 95; Strabo, *Geography*, XIV, 640); Pytheos, on the Temple of Athena at Priene and, together with Satyros, on the Mausoleum at Halikarnassos; Iktinos (q.v.) and Karpion (or Kallikrates ?), on the Parthenon, which they conceived; Theodoros of Phokaia (Phocaea), on the tholos at Delphi; Philon of Eleusis, on the arsenal (*skeuotheke*) and the proportions of the temples at Piraeus; Hermogenes of Priene, on the Temple of Artemis Leukophryene at Magnesia ad Maeandrum and that of Dionysos at Teos; Arkesios (Argelios, Tarchesios), on "Corinthian" proportions and on the Temple of Asklepios at Tralles. As for sculpture and toreutics, apparently the first treatise writers were Polykleitos (q.v.) and Euphranor, both from Sikyon; the former is supposed to have sculptured the *Doryphoros*, according to a canon of proportions that he himself explained in a book aptly entitled *Canon* (Galen, *De placitis Hippocratis et Platonis*, V, 449; Pliny, op. cit., XXXIV, 55), the latter to have written several books on proportion and on colors (Pliny, op. cit., XXXV, 129). Other theoreticopractical treatises were written by Xenokrates of Athens (ca. 280 B.C.), on sculpture and painting (ibid., XXXIV, 83), and by Menaichmos, on toreutics (ibid., XXXIV, 80; Athenaeus, *The Deipnosophists*, II, 65b, XIV, 635b, 637f). More properly descriptive treatises, often with curious information, were written by Douris of Samos (q.v.; 4th cent. B.C.), on painters and toreutics (FGrHist, 76F 31); by Adaios of Mitylene, on statues and composition (in painting), and by Antigonos (of Karystos ?), on toreutics and painting, fragments of which have come down to the present through the quotation in the treatise of Polemon of Ilium (FHG, III, 132–34); by Kallixenos of Rhodes, who is remembered for an inventory of painters and sculptors (FGrHist, 627T 1); and by Hegesandros of Delphi, on sculptors (FHG, IV, 421, 45). From the late Alexandrian and the Roman period are the treatises on painting by Hypsikrates (Diogenes Laertius, op. cit., VIII, 188), Theophanes (of Mitylene ?; FHG, III, 316, 7), and Melanthius (FHG, IV, 445); those on painting and painters by Juba II (FGrHist, 275F 80–96), Pamphilos (FHG, IV, 466), and Artemon (FHG, IV, 343, 13); and many others of which only the titles and authors' names are known.

Next to the treatises descriptive of the individual arts may be placed the works of the periegetics, that is, of the travelers who loved to take notes on the monuments they visited. These artistic-antiquarian periegeses must be distinguished from the more geographical ones, such as the "circumnavigations," which are not of interest here. The first of the periegetics is Diodoros of Athens (4th cent. B.C.), who wrote a treatise on the (sepulchral ?) monuments of Athens (FGrHist, 372); from the 3d and 2d centuries B.C. are the description of Samos by Menodotos (FGrHist, 541), *The Periegesis of the World* by Polemon of Ilium (FHG, III, 108–26), a work on the Acropolis by Heliodoros of Athens (FGrHist, 373), and a treatise on the *anathemata* of the temples of Delphi by Alexandrides of Delphi (FHG, III, 106–07). Writers from the 2d and 1st centuries B.C. include Mnaseas of Patras, with a periegesis across Europe, Asia Minor, and Libya (FHG, III, 149–58); Alketas, with a description of the dedicatory offerings at Delphi (FGrHist, 405); Semos of Delos, with a description of his island (FGrHist, 396F 1–22); Demokritos, with a work on a temple at Ephesus (FGrHist, 267F 1); Sokrates of Argos, with a description of the Argolids (FGrHist, 310); Antigonos, with a periegesis of Macedonia (FGrHist, 775); Phlegon of Tralles, on Sicily (FGrHist, 257T 1); and others about whom little is known. Pausanias, the last and the best of the periegetics, was a Greek perhaps from Asia

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

Minor; his work, the *Periegesis of Greece*, almost completely extant, was written under the Antonines, A.D. 143–61 and after 176. The historicotopographical descriptions of the Greek regions follow this order: I, Attica; II, Corinth; III, Laconia; IV, Messenia; V–VI, Elias (including Olympia); VII, Achaia; VIII, Arcadia; IX, Boeotia; X, Phocis. The last part, containing descriptions of the northern regions and the islands, has probably been lost, although it is possible that the work was left unfinished. The *Periegesis of Greece* is a sort of guide that describes in topographical order principally the Greek religious monuments of the various regions beginning with the provincial capitals, with various historical and folkloristic digressions. The work was considered by some 19th-century scholars to be based almost entirely on earlier sources, without direct knowledge of the places mentioned, but present-day opinion tends to evaluate it in a more balanced way, considering the information in it, whether gained from literary sources or from actual journeys, substantially reliable, since topographic studies and archaeological discoveries have sometimes confirmed it. Pausanias's work has serious inaccuracies and gaps, but his aims and the religious spirit that inspired him must be kept in mind. The *Imagines* of Philostratus the Elder and the Younger, modeled on older treatises of Adaios and Antigonos, are of a more ecphrastic type, containing descriptions of 65 paintings in a collection that existed at the time (3d cent. of our era) in a villa at Naples. The 14 *ekphraseis* of Kallistratos, describing statues and paintings, are similar. These are typical products of the Severan age, which were to find successors in the Byzantine era.

The Latins had no treatises that can be compared with those of the Greeks. According to Vitruvius (op. cit., VII, pref. 14), the only Romans who wrote about architecture were a certain Fufidius, otherwise unheard of; M. Terentius Varro, in his *De novem disciplinis*; and Publius Septimius, a contemporary of Varro. Their writings, together with those of the Greek treatise writers (Pytheos, Metrodoros, Hermodoros, Hermogenes, etc.), probably in Latin translations or summaries, were used by Vitruvius (q.v.) in his *De architectura*. An uneven work, "a confused stringing together of lists and notes of various periods and sources" (to quote S. Ferri's introduction to his 1960 translation of the work) in an unpolished and rather difficult Latin, it is composed of ten books: I, Architectural Principles; II, Use of Materials; III, Ionic Temples; IV, Doric and Corinthian Temples; V, Public Buildings: Theaters, Baths, Harbors; VI, Town and Country Houses; VII, Interior Decoration; VIII, Water Supply; IX, Dials and Clocks; X, Mechanical and Military Engineering. Apparently Vitruvius wrote the more homogeneous parts (I–VII) at the invitation of Octavian when the latter was dealing with the construction problems of Rome (Vitruvius, op. cit., I, pref. 2). The work, the fruit of the author's experience as an architect, is, according to S. Ferri's introduction to the 1960 translation, "a perfect theoretical system of measure and proportion, to act as a general guide to future architects."

No less a compilation, and no less confused, is Pliny the Elder's *Naturalis historia*, especially the part in which he discusses artists and works of art, analyzed from a techniconaturalistic point of view; but in fact, Pliny's interest is primarily directed toward the materials used by artists, and only occasionally does he reach the point of listing works and artists. Of interest to the history of art are the last books of the treatise: XXXIII, On gold and silver and their use by sculptors and goldsmiths; XXXIV, On the casting of metals and on bronze sculpture; XXXV, On earths and mineral colors, sculpture in clay, and painting; and XXXVI, On marble and hard stone, sculpture and carving. Pliny classified sculptors in stone, painters, and goldworkers in order of merit but dealt with sculptors in bronze in chronological order, often in groups of three or four. In this it is clear that Pliny was following two or more sources that classified differently. The problem of identifying the sources Pliny drew upon was much discussed in the 19th century; and this is related to other problems concerning his working method. Sometimes he directly transcribed the source at hand; sometimes he treated the data of the source from his point of view; and sometimes he used the source as a point of departure for a long discussion. Among the works he consulted there was certainly a chronological source, Apollodoros's *Chronica*; a technicoartistic one, Xenocrates (apparently through Antigonos, whose work had been previously used by Varro); an anecdotal one, Douris of Samos; and lastly, a periegetic one, Licinius Mucianus (the *Acta*, now lost). But besides these he had a great number of other works at hand — handbooks, encyclopedias, catalogues of artists, technical treatises, collections of *mirabilia* (perhaps that of Pasiteles), etc. — so that it is difficult today to attribute individual passages to the various sources. Contemporary critics agree that Pliny, in his evaluation, substantially followed Xenocrates's Sikyonian canon, tempered by Antigonos's Pergamene canon (see IV, cols. 120–121), and that he used a critical terminology that gains in perspicuity and clarity when read in Greek (introduction to S. Ferri's translation of Pliny the Elder, 1946, pp. 5–29). Quintilian's *Institutio oratoria* (XII, 10, 1–12) also contains a passage on the Pergamene canon (see X, col. 97).

The modern concept of art criticism — that is, an independent and constructive activity and a means of reading and "reconstructing" the artistic work — did not exist among the ancients; therefore there were no treatises on art criticism, as there were none on esthetics. However, in the writings of the philosophers (Plato, Aristotle, etc.) and the orators (Dionysios of Halikarnassos, Lucian, Callistratus Sophista, etc.) there are statements on art that, although inspired by the concepts of "type" and of "form and material" in which they believed and which formed the basis of their education, can be considered the critical code of antiquity. Basically, the ancients, too, studied the work of art, trying to break it up into its constituent elements and determine their scope, but they did so according to their almost naturalistic mentality. For a long time the ancients were unable to escape the spell of the Platonic-Aristotelian concept of mimesis (q.v.), even though conceived as the artist's idea of reality ("art is a rational quality, concerned with making, that reasons truly"; Aristotle, *Nichomachean Ethics*, VI, 4, 21). With the advent of Plotinian theories (see IV, col. 122; V, col. 36), however, which no longer considered the imagination as a mere memory of images on a sensory level but as a superior activity on a noetic level whose function is to represent intelligible beings by images, the concept of art changed, since the function of the imagination was no longer to reproduce reality mechanically but to borrow forms and colors in order to express the world of ideas, that is, the world of the artist. Such theories had a determining effect also on the use of light and color and on the suppression of geometrical and aerial perspective and the use of inverse perspective; and these theories should be considered the foundation of medieval esthetics.

THE BYZANTINE WORLD. The tradition of the ancient Greek and Greco-Roman treatises found a certain continuance in the Byzantine world, above all effecting a literature descriptive of towns, places, and works of art, sometimes in prose and sometimes in poetry, and all of it extensively permeated by rhetoric. Although conceived in the form of a panegyric, the *De aedificiis*, by Procopius of Caesarea, which contains (I, 1, 27–65) a description of Hagia Sophia, is one of the most important sources for art history from Anastasius I to Justinian I. Likewise the *Topographia christiana*, by the contemporaneous Cosmas Indicopleustes, gives information on Egypt, India, and Ethiopia; the anonymous *Patria Constantinoupoleos*, a compilation from the 12th century attributed to Codinus (Pseudo-Codinus ?), is rich in information on the Constantinople monuments. Also of some usefulness are the *De excidio Thessalonicensi*, by Ioannes Cammeniata (10th cent.), for its description of the city, and the *Descriptio Trapezuntii* and *Descriptio Corinthi* by the brothers Ioannes and Marcus Eugenicus (15th cent.). Adhering more to the ancient ecphrastic type are the descriptions of the statues of the Gymnasium of Zeuxippos by Christodoros (of Thebes; 5th cent.); of Hagia Sophia, of its ambo, and of the Pythian Baths in the writings of Paulus Silentiarius (6th cent.); of various monuments of Gaza in the rhetorical works of Procopius, Coricius, and Ioannes of Gaza (6th cent.); of the Church of

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

the Mother of God at Constantinople in a treatise by Photius (9th cent.); of the Church of the Holy Apostles in works by Constantine of Rhodes (10th cent.) and Nikolaos Mesarites (13th cent.); of the statues destroyed by the Latins during the conquest of Constantinople by Nicetas Choniates (12th–13th cent.); of the Augusteion by Georgios Pachymeres (14th cent.); of the imperial tombs in the Church of the Holy Apostles by an anonymous writer, perhaps of the 14th century; and of sacred icons, in the works of several poets, from Georgios of Pisidia (7th cent.) to Christophoros of Mitylene (11th cent.), and Emanuele File (14th cent.). But the most original work, which illustrates the Byzantine esthetic concept and pictorial technique, is a rather late treatise, the *Hermeneia* (*Painter's Manual of Mount Athos*), by Dionysios of Furna, a monk and painter from about the middle of the 18th century. This work, a complete treatise on Christian iconography, sums up and codifies the long Byzantine religious pictorial experience. According to the author's preface, the exemplars were the paintings of Manuel Panselinos, famous painter of frescoes (12th cent.) in several churches of Mount Athos, and the technicoartistic precepts of the treatise mirror the practice of a Mount Athos pictorial school of his time. The *Hermeneia* is not, therefore, an official compendium, a canon of Byzantine art, as was thought, but a handbook that sets forth the practical knowledge of the workshops. Perhaps the author kept in mind similar earlier works, but not earlier than the 16th century. The first part explains the various technical processes of the art (transfer of the drawing; preparation of the glue, of the layers of plaster, and of the gilding, colors, glazes, lacquers, etc.); the second part sets forth the various types of representation of Old and New Testament episodes and of the life of the Virgin, the saints, and the martyrs; and the third part deals with the proper distribution of sacred paintings in a church and with the inscriptions to be added to the paintings.

THE MIDDLE AGES. Certain medieval treatises are part of encyclopedias of knowledge; others have their origin in liturgical concerns; others again have a more marked technological character; and still others are real didactic instructions intended for apprentices of the various arts.

A characteristic common to all medieval treatises is in fact the preeminent position assigned by the treatise writers to the technical aspect and to the artist's purpose (functional and utilitarian). For medieval culture in general, art was not an autonomous spiritual activity, but a process that aimed, through certain materials and techniques, to produce objects intended to serve particular aspects of daily life or to be used in religious functions. This concern with the extrinsic purpose of artistic activity and preeminence of the technical aspect are the two elements found in the treatises of craftsmen, who theorized in order to train their apprentices better or to acquire greater mastery of their own trade; in the treatises of men of culture, concerned with giving all knowledge an organic and definitive arrangement; and in the treatises of churchmen, who dictated the norms according to which houses of worship and ecclesiastical furnishings were to be formed. Naturally, the internal structure of the different treatises varies according to the authors: in treatises by craftsmen the technical aspect has greater importance and the functional, utilitarian purpose remains at a secondary level or is unexpressed; likewise at a secondary level, though not entirely lacking, are statements of general concepts concerning the nature of art. These general concepts are the main concern of the more or less encyclopedic treatises written by men of culture, although they do not attain, except indirectly, the level of philosophical definitions, in that, since painting and sculpture (in part, also architecture) were considered mechanical and applied arts, the definition of their essence coincided with their operative process, understood always as a technique subordinate to extrinsic purpose. In the writings of churchmen the treatment of the functional and utilitarian purpose, considered as extrinsic to the artistic ideation as such, is primary and predominant. Art is always considered a technique serving an extrinsic purpose, and the beauty of a work of art is an aspect of its aptness to its intended purpose. The historical reconstruction of medieval treatises must therefore take into account the different origins and structures of the individual treatments.

The *artes mechanicae* (painting and sculpture) were different from the *artes liberales* of the trivium (grammar, rhetoric, and logic) and the quadrivium (music, geometry, arithmetic, and astronomy), which were more sciences than arts. Architecture was considered an applied science or a technique based on science; this explains the ambiguity of its classification, for some treatise writers placed it in the category of pure technique while others elevated it to the dignity of a science.

A reference to architecture is made in one of the oldest liturgical treatises, the *Constitutiones apostolicae* — attributed to Pope Clement I (90–99 ?) but in fact from the 4th century — which contains the first reference to the relation of ecclesiastical architecture to the Roman basilica: "And first, let the building be long, with its head to the east, with its vestries on both sides at the east end, and so it will be like a ship. In the middle let the bishop's throne be placed, and on each side of him let the presbytery sit down; and let the deacons stand near at hand, in close and small girt garments, for they are like the mariners and managers of the ship" (II, 7, 57, trans. A. Roberts and J. Donaldson, Edinburgh, 1870, p. 83). The allegorical comparison of the basilica to a ship was to be found again in later treatises concerning the architecture of the basilican type; and the allegorical interpretation of the architectural forms, which is constant in every treatise written by churchmen, is furnished with further subject matter by a sermon of St. Augustine, in which, with reference to a religious building, he says that Christians should build within themselves "the perfection one sees in stone and wood."

An early example of a treatise of the encyclopedic-scientific type concerning architecture and the architectural figural arts is the *Etymologiae* of Isidore of Seville, written between the 6th and the 7th century; architecture, painting, and sculpture (limited to ornamental stuccoes, since statuary as such was regarded with suspicion as an idolopoietic art in Isidore's time) are here considered to be manual arts, intended for producing objects necessary in man's everyday activity (see HANDICRAFTS). In the chapter *De navibus, aedificiis, et vestibus* Isidore deals with architecture as an art (in the sense of a productive technique) born of man's need of a roof for shelter, and with painting and sculpture as decorative elements added to a building to make it more beautiful. In dealing with architecture Isidore, following the concepts of Vitruvius, says that there are three fundamental elements in a building: *dispositio*, *constructio*, and *venustas* (beauty).

The part dealing with painting, sculpture, and architecture in Isidore's *Etymologiae* is perhaps the earliest example of the medieval treatise, although it is summary and included in a work of encyclopedic nature, just as the *Constitutiones apostolicae* is a very old treatise inserted into a work dealing with liturgy. In relation to painting, the *Capitulare de imaginibus*, contained in the *Libri Carolini*, written at Charlemagne's behest, is analogous to the *Constitutiones apostolicae*. Just as the latter, by recourse to allegory, justified theologically the borrowing of architectural forms and techniques from Roman antiquity, so the former, by defining painting as a technique in the service of religion, purposed to justify, against iconoclasm, the use of images in places of worship while at the same time limiting their scope. The function of painting is to recall the *res gestae*; and against idolatry, which attributes to the image a sacral quality in itself and through itself, the *Libri Carolini* stressed the human aspects of production and workmanship inherent in the images and consequently their ability to achieve a greater or lesser degree of beauty according to the personal qualities of the artisan. Images of better workmanship and more valuable material are to be admired because of their craftsmanship and the quality of the material, not because of devotion, which is due not to images as images but to God and the saints. From this limitation emerges a recognition of artistic quality (see IV, col. 124).

The compilation of the *Libri Carolini* dates from the last decade of the 8th century, and not until the 10th century is

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

there a treatise, rudimentary though it may be, that deals with the technical processes of the artisan and presumably springs from direct personal experience of those processes: the so-called "recipe book" of Heraclius, entitled *De coloribus et artibus Romanorum*. Nothing is known of its author, and the name Heraclius seems to be fictitious or borrowed from mythology. The content of the treatise is predominantly of a magicotechnological nature, not without admiration for Roman antiquity, conceived as a sort of *Paradise Lost* of man's knowledge and magic power. Of special interest is the part composed of numerous formulas and technical processes dealing mostly with illumination, glasswork, and goldwork.

About a century after the "recipe book" appeared the *Schedula diversarum artium*, written by a certain Theophilus and compiled toward the middle of the 11th century by the German monk Rogkerus (Rugerus) of Helmarshausen, who lived in the Ottonian artistic and cultural environment. The *Schedula*, which was first discussed in a 1774 article by G. E. Lessing (*Vom Alter der Ölmalerei aus dem Theophilus Presbyter*, in *Lessing Werke*, IX, Stuttgart, 1869), has a proem of a philosophical and theological nature and three books dealing with illumination and mural painting, the making and pictorial decoration of glass, and goldwork. The *Schedula* is of particular importance because the technical processes therein described from direct experience are accompanied by theoretical references indicating that the author was fully aware not only of the nature (in the ecclesiastical culture of the Ottonian empire) of the artistic function in the decoration of cult objects and buildings but also of the value added to these, in relation to their direct liturgical purpose, by the beauty of the decoration. The *Schedula diversarum artium* may thus be considered a rudimentary summary of the Ottonian-Romanesque esthetic ideas. These ideas, although they shared in the general medieval conception, were characterized by the particular importance attributed to the beauty of artistic objects as a fundamental coefficient of their aptness to their functional and utilitarian purposes. Therefore, according to the author of the *Schedula*, the pictorial decoration of walls and vaults, with its abundance of images and of colored ornamental elements, is responsible for the fact that the interior of the church — that is, of the environment intended for worship — came to be constituted as a space, which seems, because of its beauty, to be exceptional and set apart from everyday worldly experience: an anticipation of Paradise in this world. The restrictions of extrinsic purpose and the freedom of pure decoration are reconciled in the *Schedula*: images that are to be executed according to the strict prescriptions of iconography and with the intention of visually transmitting certain meanings have at the same time an ornamental function that increases the beauty of the object intended for liturgical use, while the other images, in which the inventive inspiration of the craftsman may be freely released, combine to make the object more beautiful; and the more beautiful it is, even from the simply ornamental point of view, the more it corresponds to its extraesthetic — that is, liturgical — purpose.

Chapter 12 of the *Apologia ad Gulielmum sancti Theodorici abbatem*, by Bernard of Clairvaux, contains material indirectly referable to treatises on art. This chapter, dealing with the relation between the form and decoration of places of worship and the mystical experience as it was conceived by the Cistercians, prescribes not what the monks ought to do to make their churches correspond to functional and utilitarian purposes but what they ought not do (see IV, col. 125); Bernard, in fact, denounced the abundant decoration whose principles and criteria Theophilus had laid down a hundred years before. In this respect Peter Abelard concurs with Bernard. Abelard, in his *Epistulae ad Heloisam* (in PL, vol. 178, Letter VIII, pp. 279–82), prescribed that the cloister oratory must not have precious ornaments but must be characterized by a stark severity. A completely different opinion was held by Abbot Rupertus (*De divinis officiis*), who advises the adornment of churches with as many gold and silver decorations as are compatible with the means of the faithful.

The tradition of interpreting ecclesiastical architectural forms in allegories, which goes back to the *Constitutiones apostolicae* and St. Augustine, continued uninterruptedly through the Middle Ages, providing material for a series of writings that, in whole or in part, fall within the scope of this article. In the early-12th-century *Gemma animae*, by the monk Honorius of Autun, the elements of the basilica are anthropomorphously interpreted. Besides this interpretation, in which the church structure, according to an analogy already formulated by St. Augustine, represented the body of the faithful purified by grace, Honorius formulated another allegory: the church as a building was the image of the Church as an institution. The transition from the anthropomorphous to the institutional allegory came about by way of the Song of Songs, which was also interpreted allegorically. On the basis of this complicated system of allegories that allegorized other allegories, Honorius of Autun described the ideal basilica.

Closer to architectural practice, although at the same time faithful to the tradition of allegory, was one of the most important treatises on ecclesiastical architecture of the Middle Ages, the first book (*De ecclesiae aedificatione, ornatu et utensilibus*) of the *Mitrale seu De officiis ecclesiasticis summa*, compiled by Sicardo (Siccardus), bishop of Cremona (d. 1215). The church, said Sicardo, after having begun this part with a verse from Tobit — "Lapidis pretiosi omnes muri tui et turres Hierusalem gemmis aedificabuntur," which permits him to connect his treatise with the allegorical theme that saw the Church as the New Jerusalem on earth and as a worldly prefiguration of the heavenly Jerusalem — should "rise on high, long and wide" and should contain "railings and pulpits, columns with bases and capitals"; while outside it should have "cemeteries, towers, and cloisters." The *Mitrale* of Sicardo also contains prescriptions regarding the utensils destined for liturgical use. Sicardo's work is thus one of the most exhaustive of the treatises produced by churchmen for liturgical ends, and it includes, as well, clear ideas regarding the spiritual purpose of art and the essential and intrinsic value of its beauty as a means to that end.

The *Libellus de consecratione ecclesiae sancti Dionysii* (1154) and the *Liber de rebus in administratione sua gestis* (1149), both by Suger, Abbot of St-Denis, preceded Sicardo's work by a few decades. The *Liber* contains a detailed report of the reconstruction of the basilica of St-Denis, planned and directed by Abbot Suger; the *Libellus* describes the previous state of the basilica, whose oldest parts dated from the Merovingian period, and the new basilica, which incorporated as much of the older structure as possible. From these descriptions and reports there emerges a clear picture of Suger's ideal ecclesiastical structure: it should have an abundance of pictures on the inside walls; coverings of precious materials and a profusion of gold, silver, and jewels; stained-glass windows executed by the best craftsmen from every country; and so on. The theologicophilosophical comments that accompany the historicodescriptive annotations are of particular importance. From them emerges the idea that the ecclesiastical building, through the beauty of the craftsmanship and the precious materials used, is a passage that leads man, through his senses, to direct contact with the supersensory truths of the mysteries celebrated there. While Sicardo's treatise, although later than the two historicoapologetic works of Suger, expounds the Romanesque ideal of the church conceived as a space closed in by walls that isolate it from the surrounding world, the writings of Suger give preeminence to light as a coefficient of beauty and of anagogical functionality, inseparable from each other, and expound the new Gothic concept of the ecclesiastical building as a transparent universe, material and abstract at the same time.

The fundamental *Livre de portraiture* by Villard de Honnecourt is based on the artistic act and the technical examination of it. Villard de Honnecourt was a 13th-century Picard architect who traveled widely in France and the rest of Europe. In his treatise interest is directed solely to artistic techniques — more precisely, to geometric design as the basis of architectural planning and construction. According to Villard de Honnecourt, geometry is basic not only to the structure of buildings but also to the ornamentation, which is as indispensable as structure to buildings — and to the furnishings, which he discusses, giving precise instructions on the making of a church

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

lectern. This inseparability of structure and ornament is a fundamental aspect of Gothic art, and at its base lies geometry, the essence not only of structure and ornamentation in man's creations but also of Creation itself. The mathematical essence of the cosmos is the mathematical essence of construction. Villard de Honnecourt's treatise presupposes the lifting of the operative processes of the architect and the maker of utensils to the level of a science, a mental activity; thus it represents an early assimilation into the liberal arts of an art that had been considered up to that time a constructional and mechanical activity: *iometrie*, that is, the art of design mathematically calculated as a function of the technique of construction, an application of geometry, the pure art of measuring spaces mathematically, which Martianus Capella and after him all of medieval culture had included among the liberal arts as the second art of the quadrivium.

Villard de Honnecourt's book may be considered the first organic treatise on medieval architecture; in it architecture is considered not for its possible allegorical meanings but in relation to the operative process of the architect. This process begins with an intellectual operation, a mathematically calculated design, and guides the work of the builders under the direction of the architect. The architect is thus the ideator, the planner, and the head of all the workers — an operator who participates directly in the manual work, the mechanics of the art of construction. Albertus Magnus (b. 1206/1207), in the first book of the *Metaphysics*, claims that architects are superior to purely mechanical craftsmen because they know the reasons for what they do. Villard de Honnecourt and Albertus Magnus, then, among the medieval treatise writers, may be considered the ones who most clearly anticipated — or perhaps combined to lay the ground for — the appreciation of the ideative and intellectual essence of all the arts that developed in 15th-century Florence and was to be the beginning of the modern view of art.

Vincent of Beauvais, a contemporary of Albertus Magnus, wrote the *Speculum maius*, a universal encyclopedia of knowledge based on updated versions of previous works of this type; his work is still an exemplar of the art treatise included in a philosophicoscientific encyclopedia. In the *Speculum naturale*, one of the three parts into which the *Speculum maius* is divided (the other two are the *Speculum doctrinale* and the *Speculum historiale*), Vincent metaphysically defines beauty as a quality of the whole universe, while in the *Speculum doctrinale* he provides theoretical definitions of paintings, sculpture, and architecture. In the definitions of paintings and sculpture he is close to Isidore of Seville, often repeating him textually; in the definition of architecture he sets out concepts that go directly back to Vitruvius's treatise, whose vitality had endured throughout the entire Middle Ages. The only novelty in the encyclopedia is furnished by the esthetic context resulting from the definition — corresponding perfectly to the spirit of Gothic architecture — of beauty as concordant multiplicity and variety, an indivisible union of function and ornament.

Villard de Honnecourt, Vincent of Beauvais, and Sicardo of Cremona are the three most significant treatise writers in the 13th century, respectively in the technicodidactic, ecclesiasticoliturgical, and scientificoencyclopedic fields. Among the ecclesiasticoliturgical writings may also be mentioned the occasional notes found in the oldest documents of the Franciscan order, especially in the work of St. Bonaventure of Bagnorea (Bagnoregio). Such notes are included, for instance, in the statutes of the *Constitutiones generales narbonenses* limiting figured ornamentation and lavish decoration in Franciscan churches and in a tract by St. Boneventure justifying the fact that the Franciscans built their convents and churches in the cities so as to spread devotion among the townsmen. These, however, are merely tangential notes and cannot be included among the true treatises. But the *Rationale divinorum officiorum* of Durand de Mende (d. 1296) is a systematic exposition of the liturgical significance of ecclesiastical architecture and furnishings. The work, with the usual anthropomorphic and anagogical allegorism, may be considered a sort of *summa* of medieval treatises from the liturgical point of view.

Recipe books on the preparation of the colors used in painting are numerous in the 13th and 14th centuries, texts in which usually some rudiments of chemistry are intermingled with directions concerning artistic technique. The *Libro dell'arte* of Cennino Cennini, a Florentine painter of the Giotto school, belongs in this category; but it surpasses all others for its organic quality and its thoughtful examination of the essence of painting. Just as the *Livre de portraiture* claims for architecture and for all forms of design the dignity of science based on *iometrie*, so the *Libro dell'arte* maintains that painting is the daughter of wisdom. Painting is in fact, according to Cennini, an application of science effected through the hands: "Painting . . . calls for imagination and skill of hand, in order to discover things not seen, hiding themselves under the shadow of natural objects, and to fix them with the hand, presenting to plain sight what does not actually exist" (C. Cennini, *Libro dell'arte*, in E. Holt, *Documentary History of Art*, New York, 1957, I, p. 137). The art of painting, according to Cennini, is no longer an *ars mechanica*, simply a manual technique; the technical aspect, which is analyzed carefully and explained with scientific and didactic precision, is the execution of an idea elaborated by the imagination under the stimulus of the noble spirit. In Cennini's insistence on the noble spirit as the principle of the vocation of painting and on the intrinsic morality of painting, which demands, love, respect, obedience, and perseverance, there is a vindication of the nobility of painting as an art embodying science and virtue, not simply a mechanical art. And Cennini affirms that the basis of painting is drawing, as an operation of the intellect, which "will take delight in drawing" (ibid., p. 138). Even though many of Cennini's definitions stem from the medieval tradition, the spirit in which he uses them, transcribing them in their proper context, is a new and different one, in which the intellectual basis of pictorial art has an importance that no previous author had ever dared to confer on it. What emerges from the *Libro dell'arte* is a concept of painting as an operative process which is born of sentiment (the love that decides the vocation of artists) and which arouses in the imagination the desire to present "what does not actually exist." This desire is the starting point for the pictorial process, by which, while observing a rock, the painter can draw a mountain. The phases of this process are drawing — an operation in which the intellect delights and therefore a mental operation translated into a material technique — and coloring, also not an exclusively manual operation because it draws on several sciences and demands nobility of mind and of spirit. Ideation and craft were thenceforth to be two phases of a single process. It is because of this concept that, after the *Libro dell'arte*, the medieval phase of the art treatise, which treated art either in its purely craft aspect or from the point of view of its ulterior purpose, came to an end.

The Renaissance and mannerism. *The early Renaissance.* With the 15th century the concept of art changed radically and was presented in completely new terms. There emerged a concept of art as the imitation of nature (see MIMESIS), realized through scientific knowledge of natural laws. Art was identified with science and, even as early as the writings of Alberti (q.v.), tended to be expressed in terms of a true science of vision founded on Euclidean geometry. Such a recognition implied the redemption of art from the "mechanical" sphere and its elevation to the ranks of the liberal arts (see VII, cols. 270, 275), affirming the superiority of intellectual value over material and technical values and of theory over practice — or, better, the principle according to which practice must be guided by scientific law and be identified with that law. Painting, defined by Alberti as an intersection of the visual pyramid and a surface representation of depth, is based on optics (see OPTICAL CONCEPTS) and on perspective (see XI, cols. 204–206). In addition, Alberti, the true father of the Humanist theory of the figural arts, put forward with new evidence the concept of the beautiful as harmony, that is, as a concert of all the parts among themselves and with the whole (the "eurythmy" of Vitruvius). The natural law of symmetry that characterizes the human body and makes it a harmonious image is thus the

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

basis of beauty; and because Renaissance philosophy places man at the center of the universe, a microcosm reflecting the macrocosm, the human figure, with its symmetrical and perfect proportions, seemed to reflect the symmetry and harmony of the universe and became the center and measure of all things. Since this harmony consisted in geometrical, mathematical, and proportional relationships, it followed that beauty lay in the perfection of numbers and of pure geometric forms such as the circle and the sphere.

Such a rigorous anthropocentric and mathematical concept, dominating all the arts of the Renaissance, caused the medieval concept of the beautiful as ornamentation added to form to be replaced by the concept of form beautiful in itself even if unadorned. The reaction against the flamboyant Gothic and the repudiation of pleasing materials, of polychromy, and of decorative details took place in the name of the new theoretical principles. Furthermore, the principle of the hierarchy of types, subsequently maintained up to the 19th century, derived from the same anthropocentric concept. The most noble type was certainly considered that which portrayed man and human action. Painting was essentially narrative, the painting of "history," that is to say, the representation of human actions (these being derived from mythology and from ancient and sacred history). If such was the scope of painting, it was not merely science but an art, a *poesis*: the Horatian principle of *ut pictura poesis* was revived by Alberti and remained a constant theme for more than four centuries, the true pillar of Humanistic esthetics (see HUMANISM, col. 723 ff.). Since in order to represent history the painter had to know it, he extended even more the radius of his own culture, which became encyclopedic, equal to that of the historian, the scholar, and the poet, and therefore aspired to win a similar social status. Naturally in the 15th century portraiture also had a historical justification and was considered a type as worthy as the historical one in the strict sense. It was only in the 16th century that other autonomous types were to appear — landscape, still life, scenes of everyday life — and a true hierarchy of subject matter was to become established in an explicit form (see below).

Another fundamental concept, which had already appeared in Alberti's work, was that of decorum, understood in two senses: as seemliness, morality, the repudiation of immodest and shameless subjects, and as fidelity to history and to the character of what was represented. In this sense it would have been an error of decorum to represent Mars as an ephebus or Apollo with the muscles of Mars. The artist was obliged to know the texts perfectly and to represent historical personages with their exact attributes.

The theoretical treatises of the early Renaissance, unlike those of the Middle Ages, were not aimed at the practitioners of art but at the Humanists. The three treatises of Alberti — *De pictura*, dedicated to Brunelleschi, the first theoretical writing of the new era; *De statua*; and *De re aedificatoria* — were written in Latin. Architecture is dealt with from Vitruvius's viewpoint, on the basis of the concepts of *firmitas*, *utilitas*, and *venustas*, and on the basis of his typology. In architecture, too, anthropocentrism is realized through the theory of proportion.

The new theoretical system was also developed in texts that cannot be called treatises and therefore are not included in this article (for these, see HISTORIOGRAPHY). Of this type, for example, and rich in theoretical content, is the *Commentarii* of Lorenzo Ghiberti (q.v.). Book III is a true theoretical treatise on art, which the author seeks to establish on the new scientific bases.

Schlosser has placed among the "romantics" Antonio Filarete (Averlino), a Tuscan architect and sculptor in bronze, active in Milan and Rome, who wrote his treatise (1451–64) in the form of a dialogue. The idea of the antique is very strong in Filarete, but it is accompanied by a romantic enthusiasm that colors antiquity with a fairy-tale quality, in the late Gothic manner. The foundation of an ideal city, Sforzinda, holds a preeminent position in the text; it translates for the first time into the field of town planning that rational spirit and ideal of regular beauty which was being realized in the construction of the city of Pienza, sponsored by Pope Pius II. Moreover, Filarete established architectural types, dealt with optics and perspective, and advanced a theory of color.

Dominant among the pure theorists were Francesco di Giorgio (q.v.), who wanted to be a modern Vitruvius and who published a quantity of drawings and measurements of ancient buildings; Piero della Francesca (q.v.), author of *De prospectiva pingendi*, based on Euclidean foundations; and Luca Pacioli, author of *De divina proportione* (see XI, col. 721). These three theorists were in touch with one another at the court of Urbino, where the geometrical ideal was formulated with extreme purity, later spreading out until it influenced every school of the Italian Renaissance.

The High Renaissance. The artistic theory of the 15th century culminates in the personality of Leonardo da Vinci, who, as is known, was more interested in research than in implementing the findings, more insatiable in investigation than prone to mull over the results (this is why so few of his works remain). But all the theoretical and scientific material that poured into the famous manuscript in sketches and drawings takes on the true value of artistic creation. This reduction of art to a science of vision illuminates the science itself with the genius of the artist. His thought was not bound by a fixed system: he was interested in proportion but studied it also in connection with psychic and physical movement; and he elaborated the concept of vision by accentuating the shifting values of light in shading off, that is, in the graduated passage from light to dark and in aerial perspective (see XI, cols. 209–210). The same desire to capture the most subtle and fleeting movement of the spirit appears in his studies of psychological expression and physiognomy.

It is important to emphasize that only a draft, a series of annotations and sketches, of Leonardo's treatise is extant. This explains the slight influence the treatise exerted in the 16th century, limited to Albrecht Dürer, Ambrogio Figino, and Giovanni Paolo Lomazzo. Leonardo was nevertheless the great anticipator of the century of Galileo and laid the basis of the experimental method and of the modern concept of science as investigation.

Leonardo sums up in his person the Renaissance ideal of universality. In his *Paragone* he deals with the preeminence of the arts and maintains the superiority of painting, undoubtedly a natural science through which one gains experience of the universe, the only experience that leads to knowledge. With such positivism, which opposed Platonic-Aristotelian natural and speculative philosophy and could have led Leonardo before the Inquisition, he anticipated by more than a century the revolutionary concept of science as investigation (see SCIENTIFIC AND MECHANICAL WORKS).

It should be pointed out that according to Leonardo the image is clearer and more determinative than the written word, and in this lies the cognitive value of vision and the superiority of painting to poetry. Sculpture, however, is considered inferior to painting because it demands a preponderantly manual procedure. But Leonardo's affirmation of the superiority of the ideal and cognitive values in respect to the practical and technical values of art is clear.

Antiquity and the style of the masters had but slight interest for Leonardo: nature is at the center of his theory. He defines art as an imitation of nature and declares that he who imitates other imitations is the grandson and not the son of nature. Leonardo lacks, consequently, an abstract concept of ideal beauty. The canon of perfect proportion is drawn from the direct study of reality and is not presented as an apriori design for perfection. Leonardo lastly discusses, with many subtle observations, the problems of relief, movement, color, proportion, and anatomy.

Other 16th-century treatises discussed the scientific qualification of art — for example, the lost work on anatomy by Il Rosso and the *De dissectione partium corporis humani* (Paris, 1545) by Charles Estienne — as well as perspective (J. Peckham, *Perspectiva communis*, Venice, 1593) and optics. Scientific interest lasted throughout the 16th century, and treatises often expounded on proportion, anatomy, perspective, and the like.

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

Discussion of the universality of the artist continued. In a didactic poem (*Trattato di pittura*, Rome, 1509) Francesco Lancillotti describes a vision: during a sea voyage, Painting appears to the author as a lady worthy of reverence and laments her exclusion from the liberal arts. Besides this thesis, set forth in the allegorical and symbolical terms characteristic of the century, Lancillotti discusses the concept of the *bella maniera*, *disegno*, color, composition, and invention, which were soon to be considered esthetic categories.

In the *Due lezioni sopra la pittura e la scultura*, published in 1546, Benedetto Varchi exalted the cult of Michelangelo, a typical mannerist attitude also evident in the *Disegno partito in più ragionamenti*, by Anton Francesco Doni (1549). While Varchi considered sculpture and painting to be equally noble arts, B. Cellini (letter to Varchi, in P. Barocchi, *Trattati d'arte del Cinquecento*, I, pp. 80–81) held that sculpture is superior to painting (see X, cols. 102–103). Although Michelangelo's thesis that favored sculpture was widespread, the technical and scientific sense of the definition of art was not obscured. The *De sculptura*, by Pomponius Gauricus (Gaurico), was written in the classical dialogue form; Gauricus, who was born in Salerno in 1482 and worked in Florence, Germany, and the Low Countries and who knew the works of Philostratus the Elder and the Younger and Pausanias, Pliny, and Vitruvius, not only reiterated the importance of the theories of proportion but also developed the theory of the "pregnant moment," i.e., the moment that is capable of synthesizing what has happened and what is about to happen and of suggesting the temporal development of the scene represented.

Paolo Pino, in his *Dialogo di pittura* . . . (Venice, 1548), exalted virtuosity and artifice is a new way representative of manneristic taste. Schlosser (p. 244) described Michelangelo Biondo's treatise (*Della nobilissima pittura*, Venice, 1549) as "medieval scholasticism gone mad." The treatise (*L'idea del teatro*, Florence, 1550) of the Friulian Giulio Camillo (Delminio) manifests a cabalistic and mythological erudition and opens a door on cosmic secrets. These treatises are examples of the manneristic orientation toward experimental research into new and secret laws, toward the curious, the wonderful, and the rare, which characterized the boldest points of the movement and which opposed classical and natural rules with the taste for the exceptional and the irregular, that is, a restless and anticlassical taste.

Mannerism. The mannerist concept of art remained, however, absolutely rationalistic; almost all the artists were theorists and almost all the treatises were written by artists, who claimed, in fact, to be the only ones competent to judge art, thus liberating themselves from subjection to patrons and buyers. Artistic academies were modeled on the literary ones — a triumph in the struggle to have the *arti del disegno* included in the liberal arts. Artists were differentiated from artisans, and the concept of *disegno* (the intellectual process in the creation of a work of art) affirmed the superiority of the "idea," the invention, or the *maniera* over the pure and simple technique of imitation. The theory of art as mimesis (*ars simia naturae*) was of course reiterated, and in architecture, too, imitation of natural models was spoken of; but the theory of art perfecting nature was beginning to appear. The "idea" and the *maniera* indicated the intention of the artist, and imitation was subordinated to this intention; although the influence of Aristotle and Castelvetro was still evident, there was a move toward the Platonic concept that the "idea" actually exists.

To sum up, it can be said that the mannerist treatise writers introduced all the theories and concepts that were to be influential in art for two hundred years; and in order to evaluate the tendencies of each writer it is therefore necessary to establish how these various theses and ideas were organized in his system and which ones predominated. One typical concept was that of the genius, the divine artist, the beautiful madness of inspiration, as well as the corollary that one cannot learn art but is born an artist. This thesis is in clear contrast to the contemporaneous concept of didacticism and of art as a product of rules, systems, and perfect models.

The Middle Ages had accepted the profane in allegories and moralities. With Savonarola there had been the most violent antipagan movement, which included all the arts considered hostile to Christian life. Against this background appeared the *delectando docere* theory. Art became an instrument for the diffusion of knowledge, in antithesis to the hedonistic concept characteristic of the era of Raphael, which was to be reaffirmed only in the baroque period. The old comparison culminated in the formula of *ut pictura poesis* (as with painting, so with poetry), affirmed in ancient times by Aristotle and Horace (*Ars Poetica*, 361). This theme, already put forward by Alberti, now became central and was to dominate until the middle of the 18th century. The Renaissance thesis of art as the representation of human action was developed to its extreme consequences.

The concept of decorum, understood in the two senses mentioned above, also goes back to antiquity. While the seemliness and moral aspect of decorum was developed by the moralists and by the treatise writers of the Counter Reformation, the aspect of fidelity to the subject represented and to historical reality became even more widespread and led to the establishment of iconographic and emblematic types. The moralists drew attention to the sins against decorum committed by Michelangelo, and they did so in the name of a theory that was the direct consequence of the preeminent position given to the historical and mythological content.

It may then be concluded that especially toward the end of the 16th century investigation was replaced by the codification of acquired knowledge, to the advantage of young artists. The treatise, then, assumed the value of a manual and an introduction, both theoretical and practical, to the profession.

The concept of beauty was not yet central, as it was to be in the baroque period, and the *bella maniera* rather than *arte bella* dominated. Thus arose the thesis of eclecticism as a synthesis that the artist must work in the styles of the masters and as a synthesis of nature and *maniera*. Beauty lay in the appearance of the idea. Vincenzo Danti (*Trattato delle perfette proporzioni*, Florence, 1567) placed beauty in relation to the aim: for example, anatomy would demonstrate the correct function of the limbs, which are in themselves beautiful since they are related to their function. Nature is imperfect due to its extensive accidental quality, which impedes the realization of forms; and art must emend such defects, restoring to the forms that perfection which was the intention of nature. On this subject the distinction Danti made between imitating and portraying is very clear.

Giorgio Vasari, the founder of art historiography, in the preface to the 1568 edition of the *Lives* defined painting, sculpture, and architecture as *arti del disegno*, making *disegno*, understood as a technique and as ideation, their common foundation. *Disegno* is "visual expression and declaration of a concept existing in the soul and what is imagined in the mind and constructed in the idea." The base of the three arts was *disegno* inasmuch as it was a technique of imitation, capable therefore of progress and improvement, a technique that reconciled the imitation of nature with invention and *maniera* (style). The most typical exponent of manneristic theory was Giovan Battista Armenini, who expressed even in the title of his treatise, *De' veri precetti della pittura* (The True Precepts of Painting), the tendency to establish theoretical and practical rules in order to have "a beautiful and learned style," offering a choice not only within nature but also among the examples afforded by the art of the great masters (see ECLECTICISM).

The last exponent of the century was Federico Zuccari (Zuccaro), crowning example of the cultured artist. He was a head of the Accademia di S. Luca in Rome, and his writings manifest the development the academies were to follow as centers of theoretical elaboration and of official control of taste and criticism. With sincere philosophical ambitions and with considerable ability in the use of scholastic language, he explained more clearly than others the theory of the *disegno interno* (inner design, or idea) and the *disegno esterno* (outer design, or technique). The same concept is found in the treatise by Giovanni Paolo Lomazzo (*Trattato dell'arte della pittura* . . .,

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

1584), the most important work to appear in northern Italy; ideal beauty is conceived in the neo-Platonic sense, as an image derived from God that exists in the mind of the artist, a concept in complete harmony with the spirit of the Counter Reformation. Lomazzo did not insist on the exemplary quality of the ancients; on the contrary, by defining painting as imitation in terms of perspective and by dealing at length with proportion, distinguishing between real proportion and optical illusory proportion, he assumed an anticlassical position. Leonardo's influence on Lomazzo is apparent in the latter's concern with emotions, or rather the passions or expressions, which are perfected by the study of mimicry and character (see CHARACTERIZATION: PSYCHOLOGICAL, PHYSIOGNOMICAL, AND ETHNIC), and in his attention to the phenomena of color and light.

The artistic culture of Venice, which expressed a world dominated by a lack of interest in theory and by a sensual and hedonistic sensitivity manifested in art through the use of color, is at the foundation of the writings of Pietro Aretino (*Lettere sull'arte*, 6 vols., 1537–57), Paolo Pino (op. cit.), and Lodovico Dolce (*Dialogo della Pittura . . .*, Venice, 1567). Aretino was an admirer of Titian and Tintoretto. Like him, Dolce was not an artist but a writer who supported the liberty of genius even while repeating that the artist must surpass nature and imitate reality not as it is but as it should be, and even while considering the ancient as exemplary. He did not believe in proportion because movement destroyed it, which means that he felt the irreconciliability of proportional and mathematical vision to sensual and naturalistic vision. However, he gave considerable importance to color and to the phenomena of light and shade, which are the basis of Venetian hedonism.

Some treatises were direct products of the Counter Reformation (see REFORMATION AND COUNTER REFORMATION), following the course indicated of the Council of Trent, which in 1545 began the struggle against the iconoclasm of the northern reformers and the paganizing hedonism that had animated the esthetic appreciation of images during the Renaissance.

In his *Due dialoghi . . . degli errori ed abusi de' pittori nei quadri storici* (1564), Giovanni Andrea Gilio, a churchman, dealt with "the errors and abuses by painters of historical scenes" and condemned the virtuosity that replaced iconographic fidelity to the subject represented. He took up the theory of decorum in order to lead the painter back to fidelity to the sacred texts and even went so far as to readmit to the artistic sphere the ugly and the horrible — necessary qualities in the representation of the martyrdom of the saints. He also dealt with decorum in the sense of seemliness and modesty; and throughout the late 16th century and after, in the treatise as in art history, examples abound of diatribes against nudity and the presumed lack of modesty.

Other Counter Reformation writers were Johannes Molanus (Jan Vermeulen; 1570) and Gabriele Paleotti (1582; see XI, col. 909). These were moralists, who wrote without being art connoisseurs. Their example was to be followed in the 17th century and later.

Architectural treatises in the 16th century. Vitruvius's text was rediscovered in 1414 at Montecassino, but, as mentioned previously, it had not been completely unknown during the Middle Ages. However, it was republished in 1486, then in 1496 and on up to the important edition of Fra Giovanni Giocondo (Venice, 1511, 1513), which contained woodcut illustrations. This classic edition was followed by a translation with commentary by Cesare Cesariano (Como, 1521), who was a student of Bramante and who developed the theories of *triangolatura* and *quadratura*. In 1556 in Venice Daniele Barbaro's translation was published, followed by Giovan Battista Bertano's commentary (1558). Vitruvius's text was soon translated in other European countries. The various 16th-century treatises on architecture revolve around Vitruvius, in particular those of Antonio Labacco (1552), Pietro Cataneo (1554, 1567), G. A. Rusconi (1590), and G. B. Montano (1608).

In 1542 Claudio Tolomei from Siena, Ferdinando Maffei, G. Philander, Giacomo da Vignola, and others met in Rome to found the Accademia della Virtù and to prepare an edition of Vitruvius. This program was carried out by the above-mentioned writers and by others throughout the course of two centuries.

Among the original treatises the first in chronological order and the most widely read and circulated was the *De partibus aedium*, by Francesco Mario Grapaldi (Grapaldus; 1494), many times republished and translated up to 1618. Architectural theory, which had been developed by artists during the 15th century (Brunelleschi had begun the studies on perspective and had applied his knowledge of proportion and the module to his buildings), now spread among the *signori*, i.e., the dilettantes and the patrons, who claimed for themselves the pleasure of planning. There is a clearly classical orientation in Giangiorgio Trissino's treatise, which has come down to the present day in fragments (*Frammento di un trattato di architettura*, Vicenza, 1878). The great architect Baldassare Peruzzi (q.v.) was an artist and theorist too, but his treatise has been lost; its contents are implicit in his drawings and notebooks, which are of great interest.

An admirer of Peruzzi was Sebastiano Serlio (q.v.), whose treatise was published in separate books beginning in 1537. Through him the Vitruvian classification of the five orders spread throughout Europe (Serlio lived and died in France). Among the illustrations there are numerous plans for Venetian palaces showing that the Tuscan style had penetrated into Venice. In Serlio's work is found the first treatment of the "painted façade," a type of decoration that had been widely spread by the school of Raphael. Furthermore, Serlio established the typological characters, as in the sets for tragedy, comedy, and satire. Vignola's treatise (1562) is more of a handbook; he set forth the rules and precepts more rigidly. Andrea Palladio (q.v.), in his *I quattro libri dell'architettura* (Venice, 1570), established the foundations of those architectural principles which were then to remain fixed and almost constant until the 19th century; he developed the theory of proportion with a puristic classical taste that was to give rise to the widespread phenomenon of Palladianism, so important in England and France.

With *Dell'idea dell'architettura universale* (Venice, 1615) Vincenzo Scamozzi (q.v.) opened the 17th century, adapting the theory of the "ideá" to architecture; his work, however, contains no innovations.

The treatise outside Italy. Italian theory spread slowly throughout Europe in various ways: through the presence in Italy of foreigners as invaders, pilgrims, tourists, or artists in search of work; through the activity of Italian artists abroad, called with increasing frequency to foreign courts; and through the dissemination of published treatises. The Renaissance style thus began spreading to countries still dominated by the Gothic taste, assuming new accents either through contact with traditions that were still medieval or through contamination by mannerist elements in Italy.

Once they discovered ancient and Italian art, the Germans, the French, and the Spanish sometimes became even more vigorous supporters of Italian art than the Italians themselves. The scientific spirit, considerably developed in northern Europe and especially in Germany, must have facilitated interest in a Humanistic concept of art. The first to spread to the north the art-science connection, by then consolidated in Italy, was Jean Pélerin le Viateur (Viator) with his *De artificiali perspectiva* (Toul, 1505). This was the first treatise to consider not the *perspectiva communis* — science, geometry, and optics — but the *perspectiva artificialis*, an artistic medium. It contains engravings of buildings, for the most part French, then extant.

The German yearning for the classical, so much the more acute because of the innate romantic and expressionistic spirit of the Germans, induced Albrecht Dürer (q.v.) not only to study Italian art and the ancient models but also to go deeply into theoretical research, studying proportion and perspective. He saw in beauty an almost unreachable ideal that man could approach through study, but above all through a divine gift (see IV, cols. 527–528). Dürer synthesized the Renaissance for his own country. He did not imitate the Italian artists but rath-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

er wanted to relive their art and that of the ancients within himself. Although Dürer did not consider his treatise on proportion (1528) a technical handbook, his followers used it as such. Because of the influence of Leonardo da Vinci and because of his own Germanic temperament, Dürer studied the typological and the ugly, whose phenomenology had been completely neglected by the Italian theorists and treatise writers.

In Germany the so-called "art books" directed to apprentices — not only to painters but to craftsmen in general — became popular at an early date. Walther Rivius (Ryff) published Vitruvius in German in 1543, the earliest edition outside Italy, and wrote a treatise (1547) dedicated to craftsmen, defined by Schlosser (p. 277) as "the true Bible of the late Renaissance in Germany." It is a real catalogue, based on Alberti and Serlio and illustrated with engravings derived from Italian models.

Other books or booklets were those of Erhard Schön (1538), Hieronymus Rodler (1531), Hans Sebald Beham (1528), Heinrich Lautensack (1564), and Jost Amman (1578), which constitute the beginnings of the practical treatise that was to flourish and reach its peak in the vast literature of the *libri di modelli* (model books).

In France, after the treatise on perspective by Jean Pélerin le Viateur, there appeared in 1543 the *Annotationes* of G. Philander, and in 1547 the first French Vitruvius, translated by Jean Martin and with engravings by Jean Goujon. Original treatises were those of Philibert Delorme (1561, 1567) and J. A. Ducerceau (1559, 1561).

In the Iberian Peninsula the first influence of the Italian Renaissance may be noticed in the *De pintura antiqua* (1548) by the Portuguese Francisco de Hollanda, who was in Rome in 1538 and was fascinated by the genius of Michelangelo. This treatise is composed of four dialogues in which Michelangelo himself interposes to explain his own theories (although they should not all be considered his). The author bases his work also on Vitruvius, Pliny, Gauricus, and Dürer.

Artistic theory in the baroque period. In the 17th century all the traditional theories were repeated monotonously in treatises that continually quoted previous works because of the insensibility to plagiarism, the spirit of erudition that dominated the culture, and the traditionalism that hindered all liberal attitudes to problems. However, the criticism of artists began to include that by *virtuosi*, amateurs, dilettantes, and littérateurs. Horace's theory of *ut pictura poesis* had evolved to the point where literature was considered the mistress of painting and the rules of dramatic theory, such as unity of place, time, and action, were applied to painting. This led the arts to the confused position against which Lessing was to react a century later.

The idea of the beautiful became central, and Vasari's definition of the *arti del disegno* gave way to that of *beaux arts*. First Giovanni Battista Agucchi and later Giovanni Pietro Bellori brought the concept of "idea" back from the neo-Platonic plane to the Aristotelian plane — the "idea" does not exist a priori, but derives from nature — which led to the *belle nature* theory developed by the French classicists. Technique was secondary to the idea, and this is mirrored in the art of the century, with the spread of sketches and plans whose execution was often left to others. (It is sufficient to consider Bernini, an entrepreneur and producer of ideas who availed himself of other artists to carry out his conceptions.) The hierarchy of types succeeded in establishing itself schematically in correspondence with the historical development both of the new forms of art and of the new content.

At the beginning of the century Giulio Mancini's treatise, written in 1630 but only recently published, was the first and the most comprehensive document of the new point of view. Mancini, a physician, began his treatise with a defense of criticism by nonartists, opening the way in this area to the dilettantes and littérateurs. Further, he gave considerable importance to the "idea," defined poetry as the mistress of painting, and attributed new values to the concept of decorum. He contrasted the logical and verisimilitude — nature idealized according to the principles of decorum — to pure naturalism and mannerism, which was by then obsolete. Decorum was central in the new literary concept of painting, since it was the instrument of fidelity in representations (thus in Nicolas Poussin or in Guido Reni even the colors are adapted to the subject represented, to the period, and to the characters of the personages). Furthermore, decorum justified the use of the ugly and of types, because "Vulcan must be depicted lame," and in such a type of representation a "beauty of deformity" was to be recognized, since caricature and realistic interest in art were opposed to the ideal study of the ancient. Mancini also proposed a hierarchy of types with greater clarity, establishing three types of landscape: simple, arboreal, and perfect. However, he gave more importance to historical representation, for which he demanded not only fidelity to the literary subject but also clarity of composition and perfect intelligibility.

Giovanni Battista Agucchi, a friend of artists and in close relations with Domenichino, formulated a theory in which his reaction to the *maniera* and to pure imitation in the name of the "idea" anticipated the thought of the most significant theorist of the century, Giovanni Pietro Bellori. The latter, in the introductory essay of his *Vite* (1672), more clearly condemned both the imitators of nature (Caravaggio) and those who broke away from nature (the mannerists). Nature, which during the Renaissance had been mistress of art, now came to be considered as source material over which art was mistress. That the artist rose above nature in his idea found support in the study of the ancients and of Raphael. It should be noted that by then the theories of proportion had lost all their value in determining the beautiful.

The portrait, too, was idealized, and invention, composition, and expression became the essential qualities of painting, which with new conviction was defined as mute poetry.

Except in minor treatises, such as those of Francesco Scannelli (1657) and Fra Francesco Bisagno (1642), the same theories appeared in the works of all the writers and historians of the century. What is more noteworthy is the moralistic attitude, which followed the paths laid down by the theorists of the Counter Reformation and which may be noticed in the *De pictura sacra* (1625) of Cardinal Federigo Borromeo, in the treatise published in Florence in 1652 by the Jesuit Giandomenico Ottonelli and Pietro da Cortona, and in the satires of Salvator Rosa (ca. 1664). Rosa, who violently attacked pure realism and the genre paintings of the *bamboccianti*, remained consistent in his art: he vested his landscapes and battles with an epic and philosophical value. That removed them from the ranks of genre.

Classical theory was codified in France, the country that had reacted most strongly against the Gothic tradition in accepting the Renaissance. The French aspiration toward the classical and toward rational clarity arrived at its first great expression in this century. In 1648 the Académie Royale was founded in Paris, and in 1666 the Académie de France in Rome. The real tutelary deity of the Académie Royale was Nicolas Poussin, who, although living in Rome, exercised a considerable influence in his native land. The academicians concentrated on theoretical activity, which culminated in lectures, later published, that constitute an important document of the period. The first theoretical writings were those of Hilaire Pader (1653, 1658), who translated Lomazzo and popularized Italian theory, and of Abraham Bosse (1645, 1649, 1667), who, like Mancini, reflected the problems inherent in art collecting. But the real theoretical synthesis came with the didactic poem by Charles Alphonse Dufresnoy, *De arte graphica*, often translated and widely circulated for its expository clarity. Of equal importance were the writings of A. Félibien, who rigorously defined the hierarchy of types and the theory of ideal beauty and went so far as to disavow practical knowledge and technique, even including proportion in this latter. The supremacy of literary content over pictorial form led to the rigorous applications of the three unities of tragedy. Drawing was considered superior to color. These theories were defended by Charles Lebrun (Le Brun; q.v.) for twenty years. A supporter of Poussin's ideal, he wrote a treatise (1698) on physiognomy, anticipating Johann Kaspar Lavater (*Physiognomische Fragmente zur Beförderung der Menschenkenntnis und Meschenliebe*, 1775–78) and establishing types

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

for the emotions; facial mimicry acquired the value of visual expression of the sentiments of the personages, who were portrayed like actors on a stage. Idealization led toward an abstract typology, from the particular to the general, from nature toward the ideal types. Attempts were made in every area to establish the definitive rules of true art, as was proposed in Henry Testelin's treatise, *Sentiments . . . mis en tables de précepts* (1680).

This atmosphere of rigorous domination by the Académie and of the unquestionable authority of the ancients led to the first open rebellion. These emerged in the two famous *querelles*: that of the ancients and moderns and that of the Poussinists and Rubenists. The reaction to the authority of the ancients in the name of modern progress and of freedom of taste, begun in England by Bacon, was upheld especially by the brothers Pierre, Claude, and Charles Perrault. Claude, in his treatise (1676), attacked the theories of proportion of ancient times; and he distinguished between things of absolute beauty and those of relative beauty, placing among these latter all the formal elements subject to the evolution of taste and fashion. Having thus shaken the authority of the ancients, he opened the way for the recognition of modern values.

The *querelle des anciens et des modernes* was involved with that between the Poussinists and the Rubenists. Since the 16th century the Tuscan and Roman school, based on drawing, had opposed the Venetian school, based on color. By that time drawing had been recognized as a fundamental part of the academic and classical concept, because since ancient times it had found scientific bases in perspective, anatomy, chiaroscuro, and proportion. Color, on the other hand, eluded rational and scientific definition. Drawing seemed rational and objective, color sensual and subjective. Moreover, drawing did not demand color, whereas color was inconceivable without drawing. On this point the classicists were assisted by the Cartesian principle: *Il y a de la répugnance que le plus parfait soit une suite et une dépendance du moins parfait.*

It was Roger de Piles who, in the notes to his edition of Dufresnoy (1673), took up the defense of color against Félibien. De Piles had a precedent in Lomazzo and Marco Boschini, who had maintained that drawing without color was a body without a soul. The argument was taken up in the Académie. Philippe de Champaigne upheld drawing, while Jacques Blanchard supported color. The latter declared that he who despised color was in fact imitating "sculpture rather than nature." Finally De Piles gave the most comprehensive theory of color in a study of the complementary colors, tone, etc. Moreover, he affirmed the thesis of genius and of taste, that is, of subjectivity, to which the concepts of the colorists naturally led.

THE 17TH CENTURY IN ENGLAND, SPAIN, AND THE LOW COUNTRIES. English 17th-century treatises lacked originality and importance and consisted of translations or writings that assimilated and reiterated Continental ideas; however, there were signs of an antiacademic and independent attitude, a contrast of contradictory elements that was to lead to the great innovating explosion of English thought on esthetics and the figural arts in the following century.

The only Humanistic concept with which English writers were concerned during the 16th century was the dignity of the arts as liberal arts. A translation of Baldassare Castiglione's *Il cortegiano* had so much success that it started a literary trend that exalted the "gentleman," adapting the Italian prototype to English taste and society. In 1563 John Shute's treatise on architecture introduced Vitruvius; in 1598 appeared Richard Haydock's translation of Lomazzo's treatise, and its influence can be noted in the treatise by the 17th-century miniaturist Nicholas Hilliard, *A Treatise Concerning the Art of Limning*, first published in 1911–12. Hilliard maintained, among other things, that the miniature was nobler than the fresco because it entailed less manual work. Thus the traditional comparison was adapted to the local artistic situation, in which only the miniature had gained importance. Inigo Jones (q.v.), the great architect who introduced the Palladian style to England, supported the concepts of "idea" and of invention and the need for a theoretical foundation for architecture. With Henry Peacham, the "gentleman" became the virtuoso, that is, the typical Englishman animated by curiosity about every branch of culture. It is interesting to note that Peacham translated and incorporated into his treatise (1606) a few of Vasari's biographies.

Franciscus Junius, a Dutchman, librarian to the Earl of Arundel, was the author of *De pictura veterum*, which appeared in Latin in 1637 and was translated into English in 1638. This treatise was a veritable encyclopedia of all that was known about ancient art at that time. The work therefore exerted great influence on the French treatise writers too; however, it should be noted that Junius maintained a more liberal point of view than that of the Académie: he accepted the theory of modern progress, realized that the ancients did not necessarily have to be considered exemplary, and gave great importance to the antirationalistic concept of genius. Paralleling Quintilian's five-part division of the art of oratory and the similar division of architecture by Vitruvius, Junius divided painting into five parts, a scheme later to be taken up by the French theorists. It is important to note, however, that the last part refers to grace, that indefinable beauty that escapes the rules.

In England, then, there was a keen awareness of the merit of the moderns. Bacon, as well as having been the first supporter of the superiority of the moderns over the ancients, had stated that there was no beauty without a certain unusualness of proportion and that beauty was not a product of the rules but of inspiration. This did not prevent the theory of proportion from being introduced and defended by Henry Wotton in *The Elements of Architecture* (1624), in which he worked out the neo-Platonic concept of the affinity between artistic creation and divine creation, in opposition to pure naturalism and mannerism.

Imagination, contrary to logic, continued to be considered the originating factor of art right up to Joseph Addison's *The Pleasures of the Imagination*, which manifested the following century's reaction to classicism.

One of the forces that led writers to the support of subjectivity was the taste characteristic of the amateur and of the collector, of which a precise reflection is found in the treatise (1658) by William Sanderson, who, however, still conceived landscape in the topographical sense and did not distinguish between the painter and the cartographer. After the Restoration (1660) numerous technical and theoretical treatises were published, all of them indicative of Lomazzo's mannerist influence in counteraction to French classicism, which was introduced to England by William Aglionby, whose text (1685) widely plagiarized Dufresnoy's treatise, and later by Anthony Ashley Cooper, Earl of Shaftesbury, who lived on into the 18th century and who anticipated Lessing in certain aspects. The classical movement found strong support in the literature of the day, in the works of Alexander Pope and John Dryden. The local pictorial tradition, however, created by Rubens and Van Dyck, and the influence of nearby Holland were to constitute the final and decisive bulwark against the triumph of classicism.

The Humanistic theory of architecture had penetrated into Spain in the 16th century, and the *Comentarios de la pintura* by Felipe de Guevara had anticipated the monumental work of Junius on ancient painting. In the 17th century, when the Spanish school of painting assumed European importance, texts were few but interesting. The first chronologically was that of a Florentine immigrant, Vincenzo Carducci (Vicente Carducho), entitled *Diálogos de la pintura* (1633), which, in opposition to Caravaggio, Velázquez, and Ribera, still supported the manneristic theses. Moralism, developing partly from treatises on mysticism, characterized the *Arte de la pintura* (1649) by Francisco Pacheco, Velázquez' father-in-law, which gave explicit details on the iconography of ecclesiastical painting. The *Discursos practicables . . .*, by Jusepe Martínez, and the *Pictor christianus . . .*, by Juan Interian de Ayala, which followed the same trend, should also be mentioned.

In the Low Countries Humanistic theory became established not only with Junius's treatise but also with the works by Samuel van Hoogstraten (1641), a student of Rembrandt, and by the Walloon Gérard de Lairesse (1707). Rubens and the Italianate artists were preeminent in the popularizing of the Italian concepts in the north.

In Germany, besides the works (1675–79) of Joachim von Sandrart, there was a revival of the Counter Reformation theories in the *De inanibus picturis* (1678) by J. F. Jünger and in the *Pictor errans in historia sacra* (1679) by M. Philippus Rohr.

THE 18TH CENTURY. The 17th-century treatises had shown a substantial unity, in contrast to the variety of the artistic trends during the century, but had not produced a critique capable of interpreting the art of innovators such as Caravaggio, Rembrandt, and Salvator Rosa. In the 18th century such unity gave way, in critical as well as in theoretical treatises, to a proliferation of opposing and contrasting theories whose interrelations and differing nuances and emphases cannot be detailed here; it must suffice to indicate the continuing antithesis between the classical tradition, which culminated in neoclassicism, and the anticlassical attitudes that led to the romantic movement.

England. England assumed the preeminent position held by France in the preceding century. After 1660 a classical movement had formed in literature and thought with Dryden and Pope and in art with Palladianism, which, after Wren and Vanbrugh (qq.v.), found champions and theorists such as Robert Morris (*Lectures on Architecture*, London, 1734). The Earl of Shaftesbury renewed the Humanist approach at the beginning of the century in terms that were new only in a pantheistic love of nature and in a new rigorousness that, in identifying the beautiful with the Greek, anticipated Lessing. Beauty consisted of the presence of God in nature and therefore in the harmony of the universe. Nature was, then, the norm for beauty, which was one, objective, and absolute. Furthermore, this harmony, being based on proportion, had a rational character; the very faculty in man of perceiving beauty, his taste, was a rational faculty, universal and immutable, that could be educated through the study of rules.

Toward the middle of the century this point of view changed radically. Numerous writers, under the influence of empirical philosophy, transferred their attention from the object to the subject, to the phenomenology of perception, that is, to the psychological level. Frances Hutcheson, though continuing to believe in objective and proportional beauty, investigated that mental faculty which is capable of perceiving beauty with pleasure, i.e., taste (see XI, cols. 762–766). There followed many treatises on taste, a faculty of the soul for discerning with pleasure or displeasure the beautiful and the ugly. Such an investigation was bound to lead to rejection of objectivity and of the rational quality of beauty, opening the door to new types of beauty, to the multiplicity of beauty, and to the relativity of taste. In his *Essays on the Nature and Principles of Taste* (London, 1790) Archibald Alison rejected the idea of beauty resulting from proportion. In 1759, Alexander Gerard declared that taste and genius were subjective faculties, born of the imagination; and a year later, David Hume wrote: "Beauty is no quality in things themselves. It exists merely in the mind that contemplates them: and each mind perceives a different beauty. . . ." Thus in the treatises of Richard Payne Knight (1795), Edmund A. Burke (1756), and Joseph Addison taste and genius appeared as subjective faculties, imaginative and not rational.

Naturally theory was, as ever, urged on by art; Jonathan Richardson the Elder's treatise (1715), coming so fortunately at the beginning of the century, revealed how the assimilation of current theories was fostered by the "amateur taste," which was by then highly developed in English society. The main representative of English classical and official taste during the 18th century was Sir Joshua Reynolds (q.v.), who revealed in his *Discourses* (1769–91) a liking for the masters of color, Rembrandt, Titian, and Van Dyck. Reynolds not only rejected the supremacy of "rational" design in respect to "irrational and sensual" color but also shook the hierarchy of types to its foundations, maintaining that any subject may convey feelings of greatness. He ennobled the portrait, idealizing it and translating it into an allegorical and historical portrait; but he also discerned an ideal value and a value of greatness in a pure landscape.

An opponent of Reynolds in art as in writing was William Hogarth (q.v.), author of *The Analysis of Beauty* and of the essay on the comic. Hogarth rejected the theory of proportion and any idealization in the classical sense and maintained that form must serve function. He reiterated the thesis — attributed to Michelangelo and referred to by Lomazzo — that the "serpentine" and "waving" line was the most suitable for the representation of the human figure (this was a simple preference, characteristic of mannerism, for an abstract, formal motif). Hogarth declared that grace and variety, and therefore beauty, lay in the undulating line. This was a meaningful thesis for an epoch in which the rococo taste was developing the undulating, curved line to the point of arabesque, in repudiation of the straight line and regular forms.

The concept of grace, by no means new, became important. Dufresnoy and De Piles had described grace as an indefinable form of beauty which eluded the rules and which in fact was often based on irregularity. Anton Raphael Mengs, too, considered grace a higher form of beauty; but alongside this ideal — anticlassical because it was established on an irrational presupposition — he placed another one: the sublime. Burke adopted this concept, which Nicolas Boileau had revived in his edition of Longinus, and made it a type of superior beauty: the sublime, which appeared in the works of many other writers, including Shaftesbury, indicated a type of beauty that moved the imagination with scenes of grandeur, of truth, or of horror, leaving man breathless. The roots of this ideal, too, were to be found in Michelangelo's assessment, as well as in Salvator Rosa's taste for wild and terrifying landscapes.

On the subjective level, the beautiful, which was one and absolute, gave rise to yet more categories, such as the picturesque (q.v.), related to the taste for landscape architecture, which was the object of several treatises, among them that by Uvedale Price (1794). The picturesque, born of the irregular, was the informal, unrestrained garden, the *rocaille*, in contrast to the regular architectural garden of André Le Nôtre (q.v.).

Other ideals of beauty and even other rules were discovered in Gothic and Eastern art, in forms that classicism decidedly condemned. William Chambers, in his essays (1753) on Oriental gardens and Chinese architecture, as well as Horace Walpole (1762–71) and Batty Langley (1747), in their writings on the Gothic, reflected the new anticlassical orientation.

France. In France Roger de Piles, Pierre Jean Mariette (1768), and Anne Claude Philippe, Comte de Caylus (1755), championed the critique by the connoisseur. The first great critic of the *salons*, Denis Diderot, defended the relativity of taste; he exalted feeling in comparison with traditional rationalism, and he loved the ancients as "primitives." La Font de Sainte-Yenne, another *salon* critic, supported historical painting against modern art, while D'Argenville denied the hierarchy of types and accepted all schools and all tastes. The rococo found expression in the *Réflexions critiques* . . . by Jean Baptiste Dubos, who rejected the rules in favor of feeling, which was considered the free judge of art, whose purpose was to affect the emotions.

In the 17th century François Blondel (the Elder) had been the Boileau of architecture, supporter of the classical Palladian ideal against the encroaching baroque; Claude Perrault (q.v.), as has been mentioned, had fought the rules and the authority of the ancients in the name of freedom of taste. An effect of this break may be observed in the work of Louis Géraud de Cordemoy (1706), who criticized the authority of Vitruvius in the name of truth and naturalness. The stylistic rules were deduced from a consideration of the material and the technique and their relation to the aim; the rules had to correspond to the "natural" prototype of all architecture, the wood hut. All the forms that did not have a rational function — such as the baroque twisted columns — were rejected. The reaction against classical principles took place on the level of rationalism proper to the century of the Enlightenment and not in the name of the free expression of feeling. De Cordemoy exercised considerable influence, and his ideas were spread by Marc Antoine Laugier. Other French treatises worth mentioning were those of Charles Augustin Daviler (1691), Gabriel Germain Boffrand (1743), and Charles Etienne Briseux (1752).

Germany. Germany made a fundamental contribution to the development of art criticism: Alexander Baumgarten laid the foundations for modern esthetics and Johann Joachim Winckelmann for modern historiography. Furthermore, German treatise writers, divided between the classical ideal and rococo preromantic taste, sharpened the conflict that led to the two opposing movements of neoclassicism and romanticism.

The Italian masters were judged absolutely perfect — for example, by Nikolaus Goldmann (1643), a mathematician and supporter of classical theories in architecture. The great theoretical treatise in this field was that by Josef Furttenbach the Elder, which appeared in 1635. In Dresden, classicism was to dominate even up to the high rococo period. There, the court architect and teacher at the Academy of Architecture founded in 1673, Friedrich August Krubsacius, gathered together all the principles that were traditional and by now proper to the neoclassic taste. But sensitivity to the Gothic and to *chinoiserie* was apparent in the *Fürstlicher Baumeister* . . . (1711–16), by Paul Decker. A document of the taste of the period is the work of Karl Eusebius von Liechtenstein, *Werk von der Architektur*, which was a treatise intended for the use of this great patron's descendants and was published only in 1910.

Another German, Georg Wolfgang Krafft, active in Leningrad, where Western art had successfully penetrated, dealt with architecture (1750, 1758). Anton Raphael Mengs, a painter active in Spain, revived and publicized once more the myth of beauty and of classical perfection. He wished to be the Raphael and the Poussin of his time, following the myth of the *peintre-philosophe*, like his great French predecessor. A reflection of the new sensitivity may be noted, nevertheless, in Mengs's admiration for Correggio and in his ideal of grace as a superior form of beauty. He preferred the Greek to the Roman and identified ideal beauty with the physical beauty of the human body. A similar position was taken by Gotthold Ephraim Lessing in his famous *Laokoon oder über Grenzen der Malerei und Poesia* (1766), in which he reacted against allegory as a mistaken tendency to transform paintings into poetry. The *ut pictura poesis* had in fact brought confusion to the arts. In this reaction to "history" Lessing placed beauty, as did Mengs, not so much in "human action" as in the figure. He, too, maintained the superiority of Greek art.

Another fundamental work of German classicism was the *Allgemeine Theorie der schönen Künste* (1771–74), by Johann Georg Sulzer. The same idealistic philosophy that laid the foundations for the autonomy of art by recognizing its subjectivity was dominated by classicism; while Johann Gottfried Herder, like Giovanni Battista Vico in Italy, was upholding the primitive in literature, Sulzer was influenced by Lessing's theories.

The sphere of the amateur was championed by Christian Ludwig von Hagedorn, who loved Rubens and wrote on landscape painting (1762); his work is permeated by a naturalism that is free of the rigid thesis of the hierarchy of types. Henry Fuseli (Johann Heinrich Füssli; q.v.), active in England, was an admirer of Rembrandt, Salvator Rosa, and Michelangelo and gave a romantic interpretation to the classical, contrasting the ideal of physical beauty with the taste for the visionary, at which he arrived through the classical concept of the sublime. The thesis of the spontaneity of the imagination found its greatest advocate in Wilhelm Heinrich Wackenroder (1797), who contrasted rationalism and the myth of an absolute and objective beauty with divine inspiration and spontaneity, recognizing in art an intuitive and nonrational value and basing art on feeling.

Italy. The Italian treatises in the 18th century did not attain the importance of previous centuries and continued, with few exceptions, along traditional lines, reflecting also the influence of the French, the English, and the Germans, as in the works of Giovanni Maria Ciocchi (1725) and Giovanni Gaetano Bottari (1754). Bottari wrote the *Dialoghi sopra le tre arti del disegno*, in which he restated the principles of classicism that dominated until the neoclassical movement proper.

Evident in the writings of Francesco Algarotti (1753, 1762, 1763), Antonio Martinelli (*Quattro discorsi che possono servire di risposta a quanto scrisse, scrive e scriverà . . . Giosuè Reynolds . . .*, Venice, 1783), and Saverio Bettinelli (1793) is the English fashion, which was accentuated by the continual presence of British amateurs and collectors, especially in Venice and Rome. Algarotti was also the most typical exponent of that literature for the *salons* and the ladies, which, as such, had become established in France. He was a man of the world and of the court, who in his writings on architecture (1753) made use of the work of Carlo Lodoli (see below). The Venetian tradition of Marco Boschini was continued by Antonio Maria Zanetti.

In the architectural field, practical handbooks such as that by F. Galli Bibiena (1731 ff.) continued to appear. A remarkable work was the posthumous publication (1737), edited by Vittone, of *Architettura civile*, by Guarino Guarini, who dealt at length with the cupola and analyzed the differences between Roman and Gothic architecture, explaining how, in his own buildings, after having abandoned the classical models, he had not only derived constructional principles from the Gothic but also sought the spatial effects of the Gothic. Thus were combined the various trends proper to the century: rationalism, mathematical mysticism, and the Gothic taste.

The greatest exponent of the rationalistic tendency, characteristic of the Enlightenment, was Carlo Lodoli (1690–1751), who was preceded in his theories by the Frenchman De Cordemoy. Lodoli (whose theories were compiled by Andrea Memmo in 1786) was the first in Italy to consider the beauty of a building as the representation of its function. Essence, structure, and solidity, rather than ornamentation and imitation, were the basis of esthetic merit; the reaction against the "screen façades" of the baroque, the ornamentation that hid the structure, and the disguising of the materials marked the rebellion against the baroque and the rococo and heralded neoclassicism.

Among the theoretical exponents of neoclassicism in architecture the most important was Francesco Milizia, who wrote a great deal, both historical and theoretical, always in strong opposition to the baroque of Bernini, Borromini, and Pietro da Cortona (see II, cols. 258–259).

THE 19TH CENTURY. When referring to the 19th century one can no longer speak of treatises, although the traditional literature of practical handbooks has persisted into the 20th century. The most vigorous and revolutionary, the most meaningful and efficacious theories were elaborated in writings that, except in rare cases, no longer had the traditional form of the treatise, especially at the beginning of the 19th century; rather, they appeared in letters, artists' diaries, manifestoes, and the like. Criticism itself followed the paths suggested by Diderot: it was fragmentary in form, bound to contemporary art and to the understanding of its problems and its vicissitudes. Philosophers and historians, who aimed at more encompassing works based on scholarly research, used ever more complex methods, widening the views of research. In general, studies of art divided into various areas: esthetics, criticism, poetics, the science of art, and historiography. Although these areas were interconnected, each was distinct in its purposes and instruments.

Neoclassicism was no longer the continuation of a tradition but a conscious return to the ancient, in reaction against the excesses of rococo and baroque. The neoclassical movement became the antithesis of the modern and aimed at adapting the modern to the ancient rather than at giving a present-day interpretation of the past (see ROMANTICISM). The relation between the two antithetical movements was manifested in varied and complex forms. On the esthetic level German idealism (Schelling, Hegel; see V, cols. 46–47) maintained the romantic concept of art as creation and not imitation; but the taste of all, or almost all, of the movement's exponents was neoclassical. Only Friedrich von Schlegel understood the Middle Ages and the Gothic (see IV, col. 138). In France academic taste and theory found their champions in Victor Cousin (1858), Félicité de Lamennais (1836–37), Théodore Jouffroy (1843), Antoine Chrysostome Quatremère de Quincy (1823, 1837), Emeric David (*Le cabinet du roi*, 2 vols., Paris, 1817), François

Guizot (1852), and Charles Blanc (1880). The treatise on perspective and landscape (1799–1800) by Pierre Henri de Valenciennes, although it reechoed traditional concepts on landscape, revealed a new naturalistic interest in its concern with light, shade, and color.

In Italy Leopoldo Cicognara, in his treatise *De bello* (1808), dealt with the beautiful and identified his own esthetic ideal in the art of his friend Antonio Canova. Romanticism found its first expression in the theories of the purists and Pre-Raphaelites. Antonio Bianchini's *Del purismo nelle arti* (1843) was supported by Pietro Estense Selvatico. Interest in things medieval, born of the conviction that belief and spontaneity were necessary in art, found its theorists and historians in Jacques Nicolas Paillot de Montabert (1829), Eugène Emmanuel Viollet-le-Duc (q.v.), and in England in William Young Ottley (*The Italian School of Design* . . ., London, 1823; *A Collection of Fac-similes* . . ., London, 1826), Augustus W. N. Pugin (q.v.; 1836), John Ruskin, and William Morris (q.v.). Ruskin's vast work (1903–12) is a monument to the taste and mentality of romanticism, exalting spontaneity, genius, love, and, on the stylistic level, color and light, in opposition to academic taste. William Morris (1901, 1947) offered a theoretical basis for the reevaluation of handicrafts, stressing the humbleness of the work and technique as a form of expression, in antithesis to industrial development and to art that was machine-produced for mass consumption.

Awareness of past art developed first of all among those artists who rejected tradition, repudiated the myth of the perfection of the ancients, and resolved to be men of their own times. Once more the artists led in contributing to the formation of this new historical and critical awareness. Realism (q.v.), already established in France by 1848, was founded upon the ideas of Gustave Courbet. In his *Journal* Eugène Delacroix (q.v.) praised the value of the imagination, color, and, in general, the essential points of the romantic movement; Jean Auguste Dominique Ingres, however, in his *Ecrits sur l'art* (1947), lauded the beautiful and drawing, as part of a new, refined classicism.

Beside the painters were poets, novelists, writers in general, and art dealers, who in opposition to the official criticism of the traditionalistic type gave life to art criticism in the true sense of the word — the so-called *salon* critics (Charles Baudelaire; Théophile Etienne Joseph Thoré, also known as W. Burger; Paul Mantz; Eugène Fromentin), whose writings were fragmentary but rich in new theoretical approaches and animated by new principles. Baudelaire (1868–92) identified Delacroix with romanticism and repudiated absolute principles and abstract postulates; he maintained that the critic, too, was obliged to be partial and prejudiced but must proceed from the point of view that opened the greatest number of horizons. Individuality and spontaneity became the only two postulates of art. Art freed itself completely from traditionally didactic foundations: it was not to be learned or taught.

Realism had laid the foundations for this repudiation of tradition and of the centuries-old principle of *ut pictura poesis* in favor of the present and of reality. Impressionism, in reducing reality to sensation, began the destructive process, transferring the stylistic values from object to subject — i.e., to the way of seeing things — thus opening the door to symbolism in art and to the "pure visibility" theory in historiography. "History," the chosen subject, the content, was immaterial; the real values were in line, form, and color, i.e., in the visual elements, symbols of the artist's temperament. Thus the painters were the first to seek theoretical justification for their way of feeling. Besides the writings of the impressionists (see IMPRESSIONISM) may be mentioned those of the Italian *macchiaioli* (q.v.) Adriano Cecioni (1932) and Diego Martelli (1953).

Science itself was overturning traditional principles. There is at least a parallel, if not a direct relation, between the reduction of space to time formulated by Bergson in 1889 and Cézanne's multiplying of station points in a succession of visual images.

Fauvism, cubism, futurism, and surrealism were based on precise theoretical convictions that were developed by the artists themselves and by their closest friends (see CUBISM AND FUTURISM; FAUVES; SURREALISM).

As already mentioned, among nonartist writers there was a precise distinction between the field of esthetics (to which the problem of the beautiful was left) and that of art science (concerned with the problem of artistic idiom and its schemes). As a reaction against realism the theory of art for art's sake appeared in France (Théophile Gautier, Mantz, Edmond and Jules de Goncourt, Fromentin) and opened the way to formalism, developed by Hans von Marées, Konrad Fiedler (1896), Adolf von Hildebrandt (1893), and Robert von Zimmermann (1858, 1865). Fiedler was the real founder of the science of art as distinct from esthetics — a science that concerned itself with the laws of vision, different from the laws of nature. Zimmerman left to psychology the study of the content of the imagination, retaining for esthetics that of its form. The province of esthetics was not knowledge (proper to logic), but the creation of criteria to be used as a basis for judgment — such as the material or tactile quality, or the pictorial perception or vision — criteria differing from the system proper to poetry. Attention was thus directed to symbols or visual systems. This was not a new approach, since De Piles had already stated that the parts of a picture implied the visual elements; the serpentine line of Michelangelo, for example, was a visual scheme. But while composition for many centuries (up to neoclassicism) had included "history," figures, emotions, and the like, now all these were rejected as extraneous, and composition was defined as the interrelation of line, form, and color. The theory of pure visibility culminated in the historical works of Alois Riegl (1893) and Heinrich Wölfflin (1915; see VII, cols. 526–527). The psychological theories of *Einfühlung* (empathy; see XI, col. 751), advanced by Wilhelm Worringer (1908), had their precedents in Lomazzo and in the 18th-century English treatises. The danger in this critical, historiographic, and methodological orientation was that it took a visual symbol as the yardstick for judgment, thereby creating abstract myths of form and color (e.g., the perfection of the "plastic"), and then traced the history of art as the progress of a stylistic element considered perfect at the moment of its maximum development. But this is the field of modern historiography, which identifies criticism and history, esthetics and history, and does not profess to teach artists.

Luigi SALERNO

REPRESENTATIVE TREATISE WRITERS, 15TH–19TH CENTURY. The bibliography relative to the following treatise writers is found at the end of the article. When pertinent, recent studies of particular interest were added to each separate entry in the list that follows.

The Renaissance and mannerism. Leon Battista Alberti: De re aedificatoria libri X, Florence, 1485; other eds.: Strasbourg, 1511, 1541; Paris, 1512, 1543 (trans.: It.: P. Lauro, Venice, 1543; C. Bartoli, 2d ed., Florence, 1565; Fr.: J. Martin, Paris, 1553; Eng.: London, 1739). De pictura, Basel, 1540 (It. trans. from the Lat.: L. Domenichi, Venice, 1547, Florence, 1568; C. Bartoli, in Opuscoli morali di Leon Battista Alberti, Florence, 1568); original It. text first published in H. Janitschek, L. B. Albertis kleinere kunsttheoretische Schriften, Eitelbergers Quellenschriften, XI, Vienna, 1877; other eds.: G. Papini, Lanciano, 1911; L. Mallé, Florence, 1950. De statua, original Lat. text first published in H. Janitschek, op. cit. (trans.: It.: C. Bartoli, op. cit.; Ger.: W. Rivius, Fürnembster Notwendigster angehend mathematische und mechanische Künste eigentlicher Bericht, Nürnberg, 1547). M. L. Gengaro, L. B. Alberti teorico e architetto del Rinascimento, Milan, 1939. See also ALBERTI, LEON BATTISTA. – *Romano Alberti*: Trattato della nobiltà della pittura, Rome, 1585. Origine e progresso dell'Accademia del disegno . . . in Roma, Rome, 1599, Pavia, 1604. – *Jost Amman*: Kunst- und Lehrbüchlein, Frankfurt am Main, 1578. – *Giovan Battista Armenini*: De' veri precetti della pittura libri III, Ravenna, 1587; other eds.: Venice, 1678; Milan, 1820; Pisa, 1823. L. Grassi, L'Arte, N.S., XVIII, 1948, pp. 45–54. – *Daniele Barbaro*: M. Vitruvii, De architectura libri decem, cum commentariis Danielis Barbaro, Venice, 1556. La pratica della prospettiva, Venice, 1569 ff. – *Martino Bassi*: Dispareri in materia d'architettura e prospettiva . . ., Brescia, 1572. – *Hans Sebald Beham*: Mass oder Proportion der Ross, Nürnberg 1528. – *Giovan Battista Bertano*: Gli oscuri e difficili passi dell'opera di Vitruvio, Mantua, 1558. – *Michelangelo Biondo*: Della nobilissima pittura, Venice, 1549. – *Francesco Bocchi*: Eccellenza della statua di S. Giorgio di Donatello, Florence, 1584. – *Giulio Camillo (Delminio)*: L'idea del teatro, Florence, 1550. – *Baldassare Castiglione*: Il corte-

giano, Venice, 1527; other ed.: Florence, 1892. – *Pietro Cataneo*: I quattro primi libri d'Architettura, Venice, 1554; enlarged ed., L'Architettura alla quale . . . sonosi aggiunti di più il 5.6.7. ed 8. libro, Venice, 1567. – *Benvenuto Cellini*: Due trattati, uno intorno alle otto principali arti dell'oreficeria, l'altro in materia dell'arte della Scultura . . ., Florence, 1658; other eds.: Florence, 1731, Turin, 1795; C. Milanesi, Florence, 1857; A. Jahn Rusconi and A. Valeri (together with Cellini's autobiography), Rome, 1901 (trans.: Fr.: E. Piot, in Le Cabinet de l'amateur, II, Paris, 1842; Ger.: J. Brinckmann, Leipzig, 1867; Eng.: C. R. Ashbee, The Treatise of Benvenuto Cellini on Goldsmithing and Sculpture, London, 1898). See also CELLINI, BENVENUTO. – *Jacques Androuet Ducerceau*: Livre d'architecture, Paris, 1559. Seconde livre d'architecture, Paris, 1561. Leçons de perspective, Paris, 1576. – *Cesare Cesariano*: Commento a Vitruvio, Como, 1521. – *Gregorio Comanini*: Il Figino, Mantua, 1591. – *Jean Cousin*: Livre de perspective, Paris, 1560. – *Egnazio Danti*: La Prospettiva di Euclide . . ., Florence, 1573. Vita del Vignola (introd. to Vignola, Le due regole della prospettiva pratica), Rome, 1583. – *Vincenzo Danti*: Il primo libro del trattato delle perfette proporzioni di tutte le cose che imitare o ritrarre si possono con l'arte del disegno, Florence, 1567; other ed.: Perugia, 1830. – *Lodovico Dolce*: Dialogo della Pittura intitolate l'Aretino, Venice, 1557; other eds.: M. Nestenus, F. Mouche, and N. Vieughel (in It. and Fr.), Florence, 1735; Milan, 1863; Florence, 1910; Lanciano, 1913 (Eng. trans., London, 1770). Dialogo nel quale si ragiona della qualità, diversità e proprietà dei colori, Venice, 1565; other ed.: Lanciano, 1913. M. Pittaluga, L'Arte, XX, 1917, p. 240 ff. – *Anton Francesco Doni*: Disegno partito in più ragionamenti, Venice, 1549. – *Albrecht Dürer*: Underweysung der Messung mit dem Zirkel und Richtscheyt in Linien, Ebenen und gantzen Corporen, Nürnberg, 1525, enlarged ed., Nürnberg, 1533, 1538; other eds.: Arnhem, 1603, 1606; A. Peltzner, Munich, 1908 (Lat. trans.: Paris, 1532, 1534, 1535). Etliche Underricht von Befestigung der Stett, Schloss und Flecken, Nürnberg, 1527; other eds.: Vienna, 1529; Berlin, 1803, 1823 (Lat. trans., Paris, 1535). Hierin sind begriffen vier Bücher von menschlicher Proportion, Nürnberg, 1528, another ed., Arnhem, 1603; numerous other eds. and trans. into D., Lat., Fr., It., and Port. Complete ed. of the three treatises, Arnhem, 1604. Posthumous works, ed. K. Lange and F. Fuhse, Dürers schriftlicher Nachlass, Halle, 1903. See also DÜRER, ALBRECHT. – *Antonio Filarete* (*Averlino*): Trattato d'architettura, written for Francesco I Sforza ca. 1451–64, later dedicated to Piero de' Medici, exists in manuscript. M. Lazzaroni and A. Muñoz, Filarete, Rome, 1908. – *Francesco di Giorgio*, Trattato d'architettura civile e militare, after 1482; other ed.: C. Saluzzo (2 vols., with atlas), Turin, 1841. For mss. see R. Papini, Francesco di Giorgio architetto, Florence, 1946. – *Francisco de Hollanda*: De pintura antigua, 1548; complete ed. (with commentary by J. de Vasconcelles), Porto, 1818 (Eng. trans.: A. F. G. Bell, Four Dialogues on Painting, Oxford, 1928). C. Aru, L'Arte, XXXI, 1928, p. 171 ff. A. M. Bessone Aurelj, Il Vasari, III, 1930, p. 202. – *Pomponius Gauricus* (*Gaurico*): De sculptura, Florence, 1504; various later eds., including the one of H. Brockhaus (with Ger. trans.) Leipzig, 1886. – *Giovanni Andrea Gilio*: Due dialoghi . . . degli errori de' pittori . . ., Camerino, 1564. – *Francesco Mario Grapaldi* (*Grapaldus*): De partibus aedium libri duo, Parma, 1494; other eds.: Brescia, 1501, 1506, 1508, 1516. – *Wenzel Jamnitzer*: Perspective, n.p. [Nürnberg], 1568. – *Antonio Labacco*: Libro appartenente all'Architettura, Rome, 1552. – *Alessandro Lamo*: Discorso, Cremona, 1584. – *Francesco Lancillotti*: Trattato di pittura, Rome, 1509. – *Heinrich Lautensack*: Gründtliche Underweisung, Frankfurt am Main, 1564. – *Leonardo da Vinci*: the treatise on painting circulated in various mss. until published under the title Trattato della pittura di Leonardo da Vinci, novamente dato in luce con la vita dell'istesso autore scritta da Raff. du Fresne, Paris, 1651; other eds.: Naples, 1733; Bologna, 1786; Fontani (based on ms. in the Bib. Riccardiana), Florence, 1792; G. Manzi (based on Vatican Cod. Urb. lat. 1270), Rome, 1817; H. Ludwig, Lionardo da Vinci, Das Buch von der Malerei (based on Vatican Cod. Urb. lat. 1270, with Ger. trans.), 4 vols., Vienna, 1882; M. Tabarrini, with notes by G. Milanesi (based on Vatican Cod. Urb. lat. 1270), Rome, 1890; A. Borzelli (based on Vatican Cod. Urb. lat. 1270), Lanciano, 1914; J. P. Richter, in the Literary Works of Leonardo (with Eng. trans.), London, 1883, 2d ed., London, New York, 1939; C. Ravaisson-Mollien, Les manuscrits de Léonard de Vinci de la Bibliothèque de l'Institut de France (facsimile ed.), Paris, 1881–91. L. Venturi, La critica e l'arte di Leonardo da Vinci, Bologna, 1919. See also LEONARDO DA VINCI. – *Giovanni Paolo Lomazzo*: Trattato dell'arte della pittura, diviso in VII libri, nei quali si contiene tutta la teoria e la pratica di essa pittura, Milan, 1584, 1585; other ed.: Rome, 1844 (trans.: Eng.: R. Haydock, A Tracte containing the arts of curious Painting . . ., Oxford, 1598; Fr.: H. Pader, Jean Pol Lomazzo . . ., Traicté de la proportion . . ., Toulouse, 1649). Idea del Tempio della Pittura, Milan, 1590; Bologna, 1785. M. L. Gengaro, Archivio Storico Lombardo, LIX, 1932, pp. 541–50. A. Paris, Annali della Scuola Normale Superiore di Pisa, XXIII, 1954, pp. 187–96. – *Johannes Molanus* (*Jan Vermeulen*): De picturis et imaginibus sacris, Louvain, 1570. – *Giovanni Battista Montano*: Libro d'architettura, Rome, 1608. – *Luca Pacioli*: Summa arithmeticae (with catalogue of artists), Venice, 1494. De V corporibus regularibus, Venice, 1507; new ed.: F. Riva, De divina proportione, I corpi regolari . . ., Fontes ambrosiani, XXXI, Milan, 1956. De divina proportione, Venice, 1509; other ed.: C. Winterberg (with Ger. trans.), Eitelberger-Ilgs Quellenschriften, N.S., II, Vienna, 1889. – *Giovan Battista Paggi*: Diffinizione ossia divisione della Pittura, Genoa, 1607. – *Gabriele Paleotti*: Discorso intorno le immagini sacre e profane, Bologna, 1582. – *Andrea Palladio*: I quattro libri dell'architettura, Venice, 1570, 1581; many later eds. and trans. (Eng. trans.: G. Richards, London, 1676; G. Leoni, with text in It., Eng., and Fr., London, 1715–20). R. Wittkower, Architectural Principles in the Age of Humanism, 2d ed., London, 1952. R. Wittkower, Arte Veneta, VIII, 1954, pp. 310–16. See also PALLADIO, ANDREA. – *Jean Pélerin le Viateur* (*Viator*): De artificiali perspectiva, Toul, 1505. – *Cipriano Piccolpasso*: I tre libri dell'arte del vasaio (1548), Rome, 1857; other eds.: G. Vanzolini (with reproductions of the drawings), Pesaro, 1879; London, 1934 (Fr. trans., C. Popelin, Paris, 1861). – *Paolo Pino*: Dialogo di pittura di Messer P. P. nuovamente dato in luce, Venice, 1548; other eds.: Leipzig, 1872 (facsimile); with introd. and notes by R. and A. Pallucchini, Venice, 1946. – *Antonio Possevino* (*Possevinus*): Tractatio de Poësi et Pictura ethica, humana et fabulosa collata cum vera, honesta et sacra, Rome, 1593; other eds.: Lyons, 1594 [1595]; Venice, 1603. – *Walther Rivius* (*Ryff*): Baukunst, oder Architectura . . . Unterrichtung zu rechtem Verstandt der Lehr Vitruvii, Nürnberg, 1547. – *Hieronymus Rodler*: Kunst des Messens, Siemeren (Simmern), 1531. – *Giovanni Antonio Rusconi*: Dell'architettura secondo i precetti del Vitruvio, libri X, Venice, 1590; other ed.: Venice, 1660. – *Vincenzo Scamozzi*: Dell'idea dell'architettura universale, Venice, 1615; other eds.: Piazzola, 1687; Venice, 1694, 1697, 1714 (Eng. trans., Brown, London, 1690; W. Leyburn, Mirror of Architecture, London, 1708). F. Barbieri, V. Scamozzi, Vicenza, 1952. F. Barbieri, CrArte, VIII, 1949–50, pp. 222–30, 300–13. F. Barbieri, Palladio, N.S., IV, 1954, pp. 150–60, V, 1955, pp. 135–48. See also SCAMOZZI, VINCENZO. – *Erhard Schön*: Underweysung der Proportion, Nürnberg, 1538. – *Sebastiano Serlio*: most of the books of the treatise on architecture were originally issued separately: Regole generali di architettura . . . sopra le cinque maniere degli edifici, cioè Toscano, Dorico, Jonico, Corintio e Composito con gli esempi delle antichità, che per la maggior parte concordano con la dottrina di Vitruvio, libro IV, Venice, 1537; other eds.: Venice, 1540, 1544, 1551 (the last also includes Book V). Il Terzo libro . . . nel quale si figurano e discrivono le Antichità di Roma . . ., Venice, 1540, 1551, 1562. Il primo libro . . . insieme col secondo (with Fr. trans.), Paris, 1545; Venice, 1560 (It. only). Il Quinto libro dell'architettura . . . nel quale si tratta di diverse forme de' tempj sacri . . . (with Fr. trans.), Paris, 1547; other eds.: Venice, 1551, 1559. Della habitatione (Book VI) exists in mss. in the Staatsbibliothek, Munich, and at Columbia University, New York. Il Settimo libro . . . nel quale si tratta di molti accidenti che possono occorrere all'Architetto . . ., Frankfurt am Main, 1575; Venice, 1584, 1600. Edition of Books I–V, Venice, 1566. Edition of Books I–V and Book VII, Venice, 1584, 1600, 1618, 1619; for trans. see Schlosser, pp. 418–19. G. C. Argan, L'Arte, XXXV, 1932, p. 183 ff. P. du Colombier and P. d'Espezel, GBA, II, 1934, pp. 42–59. W. B. Dinsmoor, AB, XXIV, 1942, pp. 55–91. See also SERLIO, SEBASTIANO. – *Lorenzo Sirigatti*: La Pratica di prospettiva . . ., Venice, 1596. – *Cristoforo Sorte*: Osservationi nella pittura, Venice, 1580. – *Benedetto Varchi*: Due lezioni sopra la pittura e la scultura, Florence, 1546. – *Giorgio Vasari*: Ragionamenti, Florence, 1588 and later reprints including ed. issued as Trattato della pittura, Florence, 1619. – *Jacopo Barozzi da Vignola*: Regole delli cinque ordini d'architettura in 32 tavole, n.p., n.d. [1562]; 2d ed., n.p., n.d. [ca. 1570], many later eds. and trans. Le due regole della prospettiva pratica con commentarj del P. Egnatio Danti, Rome, 1583; other eds.: Rome, 1611, 1644. – *Hans Vredeman de Vries*: Artis perspectivae plurium generum elegantissimae formulae . . ., Antwerp, 1568; other ed.: The Hague, 1604. – *Federico Zuccari* (*Zuccaro*): L'idea de' scultori, pittori e architetti divisa in due libri, Turin, 1607; other ed.: G. Bottari, in Raccolta di lettere, VI, Rome, 1768, p. 33 ff. Il passaggio per l'Italia, Bologna, 1608. Scritti d'arte, ed. D. Heikamp, in Fonti per lo studio della storia dell'arte inedite o rare, I, Florence, 1961.

The 17th and 18th centuries. a) Italy. Pietro Accolti: Lo inganno degli occhi, prospettiva pratica, trattato in acconcio della pittura, Florence, 1625. – *Giovanni Battista Agucchi*: D. Mahon, Studies in Seicento Art and Theory, London, 1947, pp. 111–54, 231–75. – *Francesco Algarotti*: Saggio sopra l'architettura, Pisa, 1753. Saggio sopra la pittura, Bologna, 1762 (trans.: Eng.: London, 1764; Fr.: Paris, 1769; Ger.: Kassel, 1769). Saggi sopra l'accademia di Francia . .

* *

THE EASTERN WORLD. *Islam*. The well-known Moslem diffidence, or even disapproval and prohibition, toward the figural arts is enough to explain the absence in Moslem culture of the treatises on art that might be expected to accompany the abundant historical, esthetic, and rhetorical writings on poetry. Even though the interest, taste, and perhaps passion for the plastic arts never completely disappeared, the theoretical treatments of those arts were generally limited to theological and juridical disquisitions on the lawfulness and the limits of such representations. In the periods and areas where the original severity gave way to a more enlightened and unprejudiced evaluation of artistic activity, which gained more and more dignity in life and in social esteem until it became an essential factor (especially, it would appear, in the Persian, Turkish, and Indian environments), interest was concentrated on the figures of the artists themselves, on their works and their schools, and rarely on the general principles and particular applications of art.

Sculpture, the most suspect among the major arts because it is closest to irreligious "competition" with the divine creative action, completely lacked any technical treatment. Painting (essentially that of miniatures) and architecture were dealt with only marginally and occasionally, in biographies and catalogues dedicated to the artists who worked in these fields; such works include the *Menāqib-i Hünerveran* (1587) by the Turk Muṣṭafā 'Alī (a primary source for calligraphers and miniaturists during the Ottoman period) and the *Tedkeret ul-Bunyān* by Muṣṭafā Sā'ī, on Sinān's great work. However, for a technical examination of materials and art rather than of the artists, it is necessary to turn to the minor arts, in many of which Moslem artistic genius excels: miniatures and calligraphy, the working of metals and precious stones, ceramics, artistic effects produced by the use of mechanics and hydraulics, and the like.

Metalworking for the production of arms — especially swords, the specialty and pride of the craftsmen of the Near East — was the subject of various technical writings, among which stand out the two *risale* on swords written by the philosopher and scientist al-Kindī (d. ca. 870); one has a descriptive and cultural character, whereas the other deals chiefly with the materials used in fabrication and tempering. A teacher called Murḍā ibn 'Alī al-Ṭarsūsī wrote a treatise (12th cent.) for Saladin; extracts have been published with a commentary by C. Cahen (1947–48). This work was not limited to swords, but embraced all branches of medieval classic armament (lances, shields, crossbows, armor, etc.). Whole sections were dedicated to single weapons in the vast Moslem technical and military literature. Even more numerous are the technical treatises on the working of metal and precious stones, often dealt with by the lapidaries, a type of naturalistic and cultural compilation especially widespread in the Islamic East. These range from the *Kitāb al-Jamāhir fī ma'rifat al-jawahir* by the illustrious scientist al-Bīrunī (10th–11th cent.), to the *Kitāb Azhar al-afkār* by al-Tīfāshī and the Persian *Tansūh Nāme* by Naṣīr al-Dīn al Ṭūsī (13th cent.), and to the Persian *Jawahir al-'arā'is*, compiled at Tabriz in 1301 by Abū'l-Qāsim 'Abd-Allāh of Kashan, one chapter of which is particularly important for its treatment of the techniques of ceramics, which at that time was at its apogee in Kashan.

Mention should be made of the literature regarding automata (q.v.) and hydraulic mechanics, which achieved considerable importance in Moslem culture as objects of figural representation. One treatise in particular, the *Kitāb fī ma' arifat alhandasīyya*, composed in 1205 by Badi' al-Zamān Ismā'el ibn-al-Razzan al-Jazarī, and drawing in part on classical tradition but even more on Moslem science and technique (see II, cols. 185–186), has been the subject of numerous technical and historico-artistic studies. Fragments of later copies of the original Istanbul manuscript have added to the iconographic material in this field and have complicated the problems.

India. The many texts from ancient and medieval India that deal explicitly with the technical aspects of painting, sculpture, and architecture are of considerable importance in understanding Indian art, its techniques, and its canons. Most of these specialized treatises were written in Sanskrit and are known as *śilpaśāstra*, or treatises (*śāstra*) on art or craft (*śilpa*; the word *śilpa* has a much more technical and circumscribed meaning than the modern Western term "art"). These texts, especially the most noteworthy and interesting of them, cannot be grouped according to subject matter, since they almost always deal with several arts; whenever a treatise deals with only one art, it is most often architecture, which was considered by the educated to be an *ars major*, whereas sculpture and painting merely adorned and increased the value of the work of architecture.

Painting and sculpture were almost always grouped together in the treatises, because in actuality they were often complementary — that is to say, they existed alongside each other in religious structures and palaces (the caves of Ajanta are an example of this) — and they had a common iconography, at least on the theoretical level. It is thought today, on the basis of references in the ancient texts, that iconography was reduced to a canon in very ancient times in order to ensure the exact execution of the sacred images. Such canons at first concerned only sculpture and were probably extended later from sculpture to painting, the latter dealing with more or less strictly religious subjects. Not only were painting and sculpture often connected, but, according to what may be read in many passages, there was a close interdependence among all the arts.

The most important treatises, besides the *Viṣṇudharmottara* (4th–7th cent. of our era), a sacred Hindu text (see I, col. 161), were the *Abhilasitārthachintāmaṇi*, or *Mānasollāsa*, attributed to King Someśvara III, who lived in the 12th century; the *Samarāṅgaṇasūtradhāra*, mainly on architecture; the *Śukranītisāra*; and the *Mānasāra*. In some of them, besides painting, iconography, iconometry, architecture, and the devotional acts that had to precede and accompany artistic creation, other arts are discussed, such as the dance (connected through its iconographic aspect to sculpture and painting), dramaturgy, and literature.

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

The references to sculpture in these texts did not concern its technical execution, which was in many aspects analogous to that of painting, but rather its iconography and iconometry. This arises from the fact that sculpture, long before painting, was considered the preferred means of representing the images intended for worship. These images had to correspond to given canons, and thus began that iconographic and iconometric tradition which was afterward applied to painting.

In the treatises architecture was, at least as much as and perhaps more than the figural arts, reduced to a series of rules, ordinances, and canons, concerned not so much with the techniques of construction as with the preliminaries (the materials with which the construction itself is effected, the dimensions and the characteristic elements that make up the building, such as columns, doors, windows). The treatises were true theoretical manuals, and any historical or individual reference was beyond their scope. The system of measurement was, for architecture as well as for sculpture, of fundamental importance; the treatises prescribed the measurements not only of every building but also of each of its architectural elements. The measurements differed according to the over-all size, the form, and the function of the building itself (see also XI, cols. 738–739).

Rita TATICCHI

China. The first treatises on art in China date from the Ming dynasty (1368–1644); it was under this dynasty, which succeeded to the Mongol rule of Genghis Khan (Yüan dynasty, 1280–1368), that Chinese art of previous ages was systematically evaluated. This does not mean, however, that the problems of art had not been discussed and that books on that subject had not been written even before the advent of the Mings; and some of these works constituted — partly, if not completely — treatises in which classifications were attempted and rules relative to the techniques of execution were laid down.

The first Chinese essays on art are those attributed to the painter Ku K'ai Chih: one concerning the method of executing transfer copies, another on certain elements of landscape painting. Unfortunately, only a few presumed fragments of these essays are known, and they are of doubtful authenticity. The *Ku-hua p'in-lu* (Old Records of the Classification of Painters), by Hsieh Ho (ca. A.D. 500), and the *Hsü-hua-p'in* (On the Classification of Paintings), by Yao Ts'ui (ca. 550), are not true treatises, since they include much information of a historical nature; their importance lies principally in their discussions of esthetics and their numerous allusions to technical questions. The same may be said for the *Li-tai ming-hua chi* (A Record of the Famous Painters of All the Dynasties), by Chang Yen-yüan, the work that remains the principal source on ancient Chinese art. Among other works that fall within the scope of this article only incidentally may be included the *Lo-yang ch'ieh-lan chi* (A Record of the Lo-yang Monasteries), by Yang Hsüan-chih (6th cent.), written to perpetuate the memory of the sacred Buddhist buildings which adorned the ancient capital of the Han dynasty (206 B.C.–A.D. 221) and which had been destroyed during the wars that devastated the north of China in those tumultuous years. The *Hua-hsüeh pi-chüeh* (Basics of the Technique of Painting), by Wang Wei (q.v.), and the *Hsieh-shan hsiu-chüeh*, by Huang Kung-wang (1269–1354), cannot be omitted, although both principally reflect the personal opinions of their authors.

The passion for antiques, one of the typical manifestations of Confucianism, led to the formation of great art collections, whose catalogues did not limit themselves merely to an enumeration of the pieces but included illustrations and explanations of decorative motifs and identifications of the works that had been in the possession of the great men of previous times, even reproducing the essential lines and particulars of the most valuable objects in collections being catalogued. Hence one cannot underestimate the importance of works such as the *K'ao ku t'u* (with a preface dated 1092), by Lü Ta-lin, and the *Hsüan-ho po ku t'u lu*, by Wang Fu, a work dating from about 1123; these two works are catalogues of antiques, especially of bronzes, which, particularly in the Sung period (960–1279), attracted the attention of the collectors. The corresponding work in the field of painting is the *Hsüan-ho hua p'u*, a catalogue of the Sung imperial collection, prepared by the emperor Hui-tsung.

Ceramics was dealt with in lengthy passages of the *Ch'a-ching* (The Classic on Tea), written in the 8th century by Lu Yü. In its present form the work has been extensively altered, but there are no doubts as to its direct derivation from the original of the T'ang era (618–906). As its title suggests, it is more a treatise on the preparation, use, and serving of the traditional Chinese beverage than a treatise on art. Of interest here is the part that deals with the form and use of the cups. Even with this limitation, the work contains a mass of useful information for the scholar of ancient Chinese ceramics.

It was during the Ming dynasty, as already mentioned, that Chinese treatises flourished, principally those on painting. The considerable diffusion of this form of artistic expression among the upper and cultured classes of Chinese society, particularly among the bureaucracy (to such an extent that Chinese officials, from the highest to the lowest rank, dedicated most of their free time to painting), caused an increase in books on the techniques of painting and on art in general. The inventive genius of Chinese art having, so to speak, exhausted itself, the attention of artists turned principally to technique, trying to substitute this for inspiration. This led to minute classifications of the various ways of painting according to the genre chosen by the artist, the artist chosen as a model, the various types of brush-strokes, and the arrangement of the various elements in the composition. This phenomenon was at its height during the 17th century and continued after the fall of the Ming dynasty (1644) under the Manchu dynasty (Ch'ing dynasty, 1644–1912).

Among works of a technical character, the best-known and most influential (both in China and Japan) were undoubtedly the *Shih-chu-chai shu-hua-p'u* (A Treatise on the Paintings and Writings of the Ten Bamboo Studio), published in 1633, and the *Chieh-tzŭ-yüan hua-chüan* (Mustard-seed Garden Manual of Painting), published between 1679 and 1701. These two works have remained deservedly famous, especially for the magnificent woodblock illustrations they contain, many of them in color.

During the Manchu reign the work begun under the Mings continued, and the field of the treatise spread to other domains of the artistic experience. In 1633 the *Yi lin hui k'ao* encyclopedia of Shên Tzŭ-an was published, containing a section on architecture that consists of a critical study based on more ancient works, many of which have been lost. For bronzes, the *Hsi-ch'ing ku-chien* was a catalogue of the imperial Manchu collection, analogous to the above-mentioned *Hsüan-ho po ku t'u lu* of the Sung era.

The 19th century marked, for all of China, the revival of the passion for antiques, a passion that was accompanied by the publication of learned treatises, principally on ceramics and jades. As early as 1774, Chu Yen had published his *T'ao-shuo* (A Description of Pottery), which was diffused also in the West among lovers of Chinese art owing to the translation by S. Bushell under the title *Description of Chinese Pottery and Porcelain* (Oxford, 1910). This work was followed by the *Ching-tê-chên t'ao-lu* (A Memoir on the Ceramics at Ching-tê-chên; at the time this work was written, the production of Chinese ceramics was entrusted almost exclusively to the imperial manufactories at Ching-tê-chên), by Lan P'u (1815). This work also became known in the West, through the incomplete translation edited by S. Julien (1856) and the complete one by G. R. Sayer (1951).

A work of fundamental importance on antique jade was the *Ku-yü t'u-k'ao* (An Illustrated Study of Antique Jade), by Wu T'a-ch'êng, published in 1889. The author based his critical and technical disquisitions on the pieces contained in his own rich collection.

These, in short, are the basic Chinese treatises; this brief exposition cannot list all the treatises in which Chinese artistic literature abounds but merely indicates the most important works and those which have had the greatest influence on the development of Chinese art and which have given greater impetus to modern criticism.

TULUNID ART. By Tulunid art is meant the artistic production that was developed in Egypt under Aḥmad ibn-Ṭūlūn and his descendants (A.H. 254–92; A.D. 868–905). Although it derived its characteristics in the first place from the style of Samarra (see ABBASSIDE ART; ISLAM), Tulunid art was nevertheless rich in original elements and constitutes one of the most conspicuous achievements left by the first westward expansion of the art of the Abbasside caliphate.

SUMMARY. Historical background (col. 319). The mosque (col. 320). The minaret (col. 322). Architectural origins (col. 324). A Tulunid house (col. 325). Minor arts (col. 325).

HISTORICAL BACKGROUND. The Tulunid period was an important turning point in the history of architecture and art in Egypt. Hellenistic and Coptic influences had previously predominated (see COPTIC ART; LATE-ANTIQUE AND EARLY CHRISTIAN ART), as may be observed in the remains of woodwork, carved

Principal centers of historic and artistic interest of the Tulunid domain. *Key*: (1) Tulunid territory until 877; (2) territories conquered by Ibn-Ṭūlūn in 878; (3) extension of the Tulunid sphere of influence under Khumārawayh (889–96); (4) boundary of the Abbasside caliphate.

with acanthus and vine ornament, that have survived in the Mosque of 'Amr at Fostat (Old Cairo); these date from A.H. 212 (A.D. 827), in which year the mosque was enlarged by 'Abd-Allāh ibn-Ṭāhir.

Until the Tulunid period Egypt had been ruled by a series of governors appointed by the caliph, scarcely any of whom had held office for more than three years. Aḥmad, who was born at Samarra in 835, was the son of Ṭūlūn, a Turki slave who had been sent by the governor of Bukhara to the caliph al-Ma'mūn in 815. Aḥmad received an education quite exceptional for one in his position. In 868 he was sent to Egypt as deputy governor of Fostat and a year later was given authority over the whole country.

At first he resided in the Dār al-Imāra of Fostat, but in 870 he proceeded to form a new suburb corresponding roughly to the area at present bounded on the east by the Citadel, on the north by the Shāri' aṣ-Ṣalība, which runs from the Citadel to Sayyida Zaynab, on the west by the Qal'at al-Kabsh, and on the south by a line drawn from east to west a little to the north of the Great Aqueduct. On the east side of this suburb, which was known as al-Qaṭā'i', and at the foot of the rock later occupied by the Citadel, he built himself a palace known as al-Maydān. It had nine gates, and in front of it was a great open space (maidan; Ar. *maydān*) extending as far as the mosque that he built a few years later. On the southeast side of the mosque was the Dār al-Imāra, which had a door (which still exists to the west of the pulpit) opening into the mosque. This enabled Ibn-Ṭūlūn to pass directly into the *maqṣura*, as was the rule in early Islam (e.g., at Damascus, Basra, Wasit, Merv, and Baghdad). He also built a hospital (*māristān*) in 872, intended solely for civilians, and an aqueduct with its intake tower (FIG. 320) at Basatin, a village about 4 miles south of the Citadel.

THE MOSQUE. The people having complained to Ibn-Ṭūlūn that on account of the number of his troops there was not enough room in the Mosque of 'Amr on Fridays, he decided to build a new mosque on an outcrop of rock called Gebel Yashkur. The mosque was built with brick piers instead of columns; this was such a novelty that two explanations were current, one (by Ibn-Duqmāq and Maqrīzī) that brick piers were adopted because marble columns cannot withstand fire, the other (by al-Balawī) that Ibn-Ṭūlūn did not wish to pillage churches for the 300 columns that would have been required. This story has all the appearance of a legend invented to explain the use of piers, which were an innovation in Egypt, whereas their use is perfectly well explained by the fact that Ibn-Ṭūlūn came from Samarra, where only a few years previously two immense mosques had been built with their roofs supported on piers.

Ibn-Ṭūlūn's mosque impresses one by its great size and by the noble simplicity of its plan. One mounts first a slope to reach its doors, then a few steps to enter the *ziyāda* (outer court), and from the *ziyāda*, by a semicircular flight of steps, one reaches the mosque proper. On entering one is struck by its air of peace and serenity, completely cut off as it is from the noise of the street, by its chaste ornament, and by its devotional atmosphere. The window grilles, which, in the shadow of the porticoes, stand out against the sky like delicate lacework, add greatly to the charm.

The scheme of the mosque can be seen from the plan (FIG. 321; VIII, FIG. 341) and the transverse section (FIG. 321). It consists of a *ṣaḥn* (rectangular court) about 302 ft. square surrounded by *riwāqs* (porticoes), five aisles deep on the *qibla* side and two aisles only on the other sides. *Ṣaḥn* and *riwāqs* constitute the mosque proper, which forms a rectangle measuring 401 ft. in width and 460 in depth with walls about 50 ft. high. It is surrounded — except on the southeast side, which

Basatin, Aqueduct of Aḥmad ibn-Ṭūlūn, plan of the intake tower (*from Creswell, 1932–40, II, fig. 244*).

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

was occupied by the Dār al-Imāra — by a great outer court (*ziyāda*) roughly 62 ft. broad. The whole forms a great rectangle almost exactly square (531 × 532 $^1/_2$ ft.). These *ziyādas* must be regarded as corresponding to the outer temenos (sacred enclosure) of a Semitic sanctuary, such as the Arab invaders met with when they captured Damascus. The building material consists of excellent red bricks measuring 7–7 $^1/_2$ × 3–3 $^1/_4$ × 1 $^1/_2$ – 1 $^3/_4$ in., with joints about 1 in. thick, the whole being coated with a fine and very hard white stucco in which the ornament is cut.

The unit of measurement employed in setting out the mosque must have been the Nilometric cubit of just over 21 $^1/_4$ in., for all the main measurements are multiples of it, with minute differences: the northeast wall externally measures 300 Nilometric cubits with a difference of 5 in.; the *ṣaḥn*, northeast side, measures 170 cubits less $^1/_2$ in.; the thickness of the wall of the mosque proper is 3 cubits less 0.4 in., etc. Why was the "black cubit" of Iraq not used? Possibly because Ibn-Ṭūlūn was more impressed and attracted by the cubit of the Nilometer, with which he must have been well acquainted, for he had restored it only twelve years previously.

The outer doorways are merely rectangular openings in the wall (monumental entrances had not yet been evolved), and the walls are absolutely plain except for a couple of fillets surmounted by a row of circles in squares and a curious cresting. The façade of the mosque proper on the northeast (PL. 189) seems to have been divided horizontally into two nearly equal parts. The lower part is perfectly plain except for one small and six large doors, all flush with the wall. In the upper half is a row of 31 windows with pointed arches and 7 slightly smaller recesses of the same shape, with their sills about 19 ft. above the floor of the mosque. Their arches rest on stumpy engaged columns without capitals, and the spandrels between the windows are occupied by small niches with fluted hoods. The top of the wall is capped by a row of circles in squares and a curious openwork cresting, exactly as the outer walls. The doorways of the mosque proper are perfectly plain like those of the outer wall. There are seven in the northeast and southwest sides and five in the northwest, making nineteen in all, so placed that each (except the small ones at either end of the rear aisle of the sanctuary) corresponds to a door in the outer wall. Each of these doorways is spanned by a row of palm trunks sawn down the center and laid with the round side uppermost. They have been boxed in by planking, plain at the sides but with carved ornament underneath. Four of these carved soffits have been preserved (PL. 192). Above this composite lintel is a brick relieving arch, as at Samarra. Besides the doors mentioned above, there are four more in the *qibla* wall.

The interior consists of a *ṣaḥn*, roughly 302 ft. square, with 13 pointed arches on each side. The sanctuary (PLS. 190, 191) is formed by five arcades of 17 arches each, the other *riwāqs* comprising only two arcades. The arches rest on piers 8 ft. in width and 4 $^1/_2$ ft. deep; those of the sanctuary are a little over 14 $^1/_2$ ft. in height, but the rest are about 1 $^1/_2$ ft. less. The rise of the pointed arches, which have a slight return, is 12 ft. The arches, including those of the windows, are surrounded by a continuous band of ornament, which turns at a right angle at the springing, runs across the top of the pier, and then turns at a right angle again to run around the next arch. The wall above each pier is lightened by a small pointed arch. At the summit of the arcades is a broad frieze of leaf-shaped motifs in stucco, and above it is the famous Kufic inscription on wood, over 1 $^1/_4$ miles in length, which runs along about 12 in. below the ceiling.

The soffits of the arches are decorated with bands of ornament, of which ten fairly well-preserved strips exist on the outer arches of the southwest *riwāq* and a few others elsewhere. Each band consists of a very broad central strip enclosed between narrow borders. The main strip in nearly every case consists of a geometric framework, the interstices of which are filled with various elements belonging to style B of Samarra (I, col. 8), which suffices to prove that this decoration dates from the foundation of the mosque. This framework, in arches S.W.4 and S.W.5, consists of two quite different designs, both set out on a network of squares placed at an angle of 45 degrees (FIG. 323, nos. 1, 3). Arches S.W.8, S.W.9, and S.W.10 show entirely different designs, all set out on a network of equilateral triangles (FIG. 323, nos. 2, 4, 5). The variety of designs, some composed of straight lines, some of interlacing circles, that can be set out on the same network is extraordinary. One may speak of two large groups of 45-degree and 60-degree patterns.

The windows form one of the most beautiful features of the mosque. There are 128 in all, and they average 6 ft. in width and 7 $^1/_2$ ft. in height. The author has shown elsewhere (Creswell, 1932) that only three, or at most four, of the grilles are original. These stand out, absolutely distinct from the rest by the fact that they are mainly composed of compass work, i.e., interlacing circles and segments of circles (PL. 192; FIG. 323, nos. 6–8).

Cairo, Mosque of Aḥmad ibn-Ṭūlūn: transverse section; *above right*, schematic plan (*from Creswell, 1932–40, II, figs. 247, 257*).

THE MINARET. The minaret, well described by Corbet (1891) as "the most remarkable and enigmatic feature in the whole building," is built of blocks of hard limestone. It is divided into four stories, of which the lowest is approximately square in plan and 69 $^1/_2$ ft. high; it has a staircase on the outside, which makes one complete turn in a counterclockwise direction. Above this is another story, 28 $^1/_2$ ft. high and circular in plan, also with a staircase on the outside, which makes a little more than half a turn round it. Above this is a little octagonal kiosk of two stories, 16 $^1/_2$ and 18 $^1/_2$ ft. high respectively, the finial being 133 ft. above the ground. The second landing of the staircase is connected with the roof of the mosque by a stone bridge, carried on two parallel horseshoe arches 13 $^1/_4$ ft. in span that support a barrel vault. This bridge abuts against the mosque in an absolutely inorganic manner, its width extending from the middle of the twelfth to the middle of the thirteenth window, counting from left to right. The four faces of the lower story are each decorated at the same level with a blind window divided by a column, which serves as a central support for a pair of round horseshoe arches set in a rectangular frame molded

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

in plaster. High up in the southeastern face is another blind window, similar but not set in a frame.

This minaret has provoked more discussion than any other Moslem monument in Egypt. Al-Muqaddasī, writing in 985, says that "its minaret of stone is small and its staircase is on the outside," and al-Quḍā'ī, writing in the following century, says that it was copied from the minaret of Samarra (I, PL. 11). Moreover, Ibn-Duqmāq and Maqrīzī repeat a little fable to the effect that Ibn-Ṭūlūn, toying one day with a piece of paper and rolling it round his finger, produced a spiral and then

Cairo, architectural decorations of the Mosque of Aḥmad ibn-Ṭūlūn, analysis of geometric designs in stucco. (1–5) Soffits of the arches; (6–8) window grilles (*from Creswell, 1932–40, II, figs. 249, 253–55*).

ordered his architect to take it as a model for his minaret. Now, this does not fit Ibn-Ṭūlūn's minaret *in its present form*, so the question arises: has this minaret undergone alterations? It is obvious that the two horseshoe arches that join it to the mosque must be of more recent date. Can it date from the period of Sultan Lājīn (r. 1296–99)? Two distinctive features at once present themselves as a basis for argument, viz., the two horseshoe arches of the bridge and the five pairs of blind horseshoe arches set in the faces of the minaret. Such arches appear in Egypt for the first time in the Madrasah-Mausoleum of Sultan Qalā'ūn (1284/1285; IX, PL. 270), so it can be assumed that extensive alterations to the minaret formed part of the restoration carried out by Lājīn in 1296. Was the second story part of an original helicoidal minaret copied from the minaret of Samarra and running right down to the ground, the lower part of which had become ruinous and been given a casing by Lājīn, the bridge being built at the same time?

In 1920 A. Patricolo, the chief architect to the Comité de Conservation des Monuments de l'Art Arabe, decided to test this. He began work at the back of the recess on the southwestern side and cut a horizontal shaft in the masonry about 6 ft. wide, 3 ft. high, and $7^1/_2$ ft. deep. The masonry proved to be coursed; no sign of a junction circular in plan was found, nor indeed any break in the masonry, although a point was reached not only well within the curve above which the outer edge of the spiral staircase would have passed, had it descended to the ground, but at least 18 in. within the outline of the round core embraced by the staircase of the present upper story. This discovery is of fundamental importance; it shows that the lower part is not merely a casing but is one with the whole minaret, which, on account of the features discussed above, can have been built only by Lājīn.

ARCHITECTURAL ORIGINS. The statement of al-Quḍā'ī, preserved in Ibn-Duqmāq and Maqrīzī, that the mosque of Ibn-Ṭūlūn was built after the style of the mosque of Samarra, is certainly not correct, for it does not resemble either of the two mosques at Samarra, except that all three are surrounded by *ziyādas*. It differs from the Great Mosque of Samarra in the number of its aisles — 5, 2, 2, 2 instead of 9, 4, 4, 3 — and in the fact that its roof rests on arcades instead of directly on the piers. Its piers alone recall those of Samarra, but whereas the latter are square and have engaged columns at the corners, those of Ibn-Ṭūlūn are oblong and the corner columns are counterfeited in the brickwork. Its plan, instead of being oblong as at Samarra, is square, as were the great mosques of Basra, Kufa, Wasit, and Baghdad. Neither does the façade recall Samarra, for there are no half-round bastions, nor do the windows, for those of Samarra are treated like arrow slits externally and have lobed arches internally, whereas those of Ibn-Ṭūlūn resemble the windows of the Mosque of 'Amr of 827, minus the transverse beam and wooden centering.

It is universally agreed that the ornament is derived from Samarra, but whereas at Samarra the three styles — A, B, and C — occur separately, in the mosque of Ibn-Ṭūlūn they are combined and mixed, and only the vine leaf with sculptured middle rib is found, not the type with sharply cut concentric ridges. It is principally in respect of its ornament and its piers that this mosque may be regarded as a foreign Iraqi building planted on the soil of Egypt, and a large number of Iraqi craftsmen must have been employed for its ornament in wood and stucco. This is not surprising, for Ibn-Ṭūlūn had come from Samarra and thousands of Iraqis doubtless followed him when they heard that he had risen to power. But many were there already, for Ibn-ad-Daya (*al-Mukafa'a*, p. 362; Creswell, 1932, p. 356) relates that about 861 a refugee from Iraq found so many people of Baghdad in Fostat that he was afraid of being recognized. The ornament of the Mosque of Ibn-Ṭūlūn and that of the Dayr as-Suryānī (Deir el-Suryani; ca. 914) in Wadi Natrun, west of the Nile Delta, are the two most westerly examples of the art of the Abbasside empire of the period — an art that prevailed over an immense area, from Nishapūr and Afrasiyab (Samarkand) to Bahrein in the south and to Rusafa in the northwest, where a band of stucco ornament in style B has been applied to the apse of the great basilica.

In the arcades of the sanctuary, the small arches above the piers are intended to economize masonry and at the same time to reduce the weight on the piers; such arches were employed for the same purpose in Roman bridges, e.g., the Pons Mulvius and the Pons Aemilius in Rome, both of the 2d century B.C. The system first appears in the East when Shāpur I captured the Roman emperor Valerian and his army in A.D. 260. Al-Ṭabarī says that the Roman prisoners built the great weir at Shushtar, which is 1693 ft. long and has 41 arches, with a small arched tunnel above each pier. At Dizful, only 10 miles away,

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

is a bridge of the same type, which is attributed by Mustaufī to Ardashir I (r. ca. 226–41), but as Ibn-Sarābīyūn calls it the Roman Bridge (al-Qanṭarat ar-Rūmīya), it was presumably built by Roman prisoners also.

A TULUNID HOUSE. Precise dating of the houses excavated at Fostat presented great difficulties, because none had been found with its stucco decoration preserved. However, excavations carried out in 1932 a little to the north of Fostat, between the Mosque of Abū's-Su'ūd and the Great Aqueduct, brought to light a house built of red bricks, with fine panels ornamented in style C.

This house stands on the site of al-Qaṭā'i', which was destroyed by the Abbassides on the fall of the Tulunid dynasty in 905; this gives one limit for the date. The part uncovered consists of three parallel rooms in communication with one another, the largest of which measures only 17 × 13 ft. The side rooms open on the portico by doors only, but the central one is open for its entire width. In front is an isolated pier, which must once have belonged to a triple-arched portico, about $8^1/_2$ ft. in depth and 37 ft. in length. This grouping of rooms is frequently found in the houses of Fostat, and even the curious feature of a passage leading out of one of the side rooms into the back of the central one occurs in two of the houses excavated by Ali Bahgat Bey. A similar passage occurs in Cairo, in the house of Jamāl ad-Dīn adh-Dhahabī, dated A.H. 1046 (A.D. 1636), where the *maq'ad* is served by a similar passage. It is clear that this passage, which leads from a little vestibule where there is a marble arcade on dwarf columns supporting a shelf on which to make coffee, is a service passage by which servants bringing refreshments could enter. It can therefore be concluded that the passage in the house under discussion was also a service passage, corresponding to the passages in the residential quarters at Ukhayḍir (Iraq) that led to transverse kitchens behind the triple liwans. A few feet from the surviving pier of the portico were the remains of a basin, about 12 ft. square, with a sunken octagonal part in the center.

The plan comes, like the ornament, from Iran and Iraq, for there are similar liwan groups at Qaṣr-i-Shīrīn (Kurdistan), built by Khusrau II (r. 590–628), and at Ukhayḍir (ca. 778). This type, which consists of three barrel-vaulted liwans set side by side and generally preceded by a triple-arched portico, was adopted at Samarra, which was the Abbasside capital from 836 to between 884 and 891. The surviving pier suffices to show that the three parallel rooms of the Tulunid house were preceded by a portico, and on the analogy of Ukhayḍir one must suppose that the surviving part was duplicated on the opposite side of the courtyard with the fountain. The appearance of this type of house on the site of al-Qaṭā'i' must be attributed to Ibn-Ṭūlūn and the great number of Iraqis who must have followed him to Egypt.

MINOR ARTS. In the minor arts the main achievement of the Tulunid period was in wood carving, nearly all pieces being in the *Schrägschnitt* (diagonal cut) style. The objects that have survived are almost all either door panels or the sides of cenotaphs, all of which give an impression of extraordinary vigor and virility. Those which are preserved in Cairo have been published by Pauty (1931).

TUNG CH'I-CH'ANG. Chinese calligrapher and painter of the late Ming period (14th–17th cent.). As was typical of the *wên-jên*, or literati, painters, Tung Ch'i-ch'ang was also a high government official, a serious art critic, and an ardent collector. A large number of his important paintings are in a good state of preservation, as well as colophons on major pieces of ancient calligraphy and painting, which have been treasured for his learned opinion and handsome script.

Born in 1555 to a poor but scholarly family of Shanghai, then a small town, Tung left home as a youth to seek his future in the neighboring large city of Sung-chiang (Sung-kiang), and history was to remember him as the great master of the Sung-chiang school of painting. He first attended the prefectural school there and later served as tutor in a prominent family. While presumably studying and teaching the Confucian classics in preparation for the civil examinations, Tung took up the art of calligraphy and painting as proper gentlemanly self-cultivation. He quickly distinguished himself in both. The great collector Hsiang Yüan-pien (1525–90), of Kashing (Chia-hsing), taught Tung the traditional connoisseurship; and a local painter, Ku Chêng-i, also Tung's senior, perhaps gave him some beginning painting lessons.

The sophisticated literary society that encouraged the arts at that time was, on the one hand, frustrated by the deteriorating political situation and, on the other, fascinated by the developments in late Ming thought, particularly that of the new K'uang Ch'an school, led by Ho Hsin-yin (1517–79) and Li Chih (1527–1602), whose new departure from Ch'an (Jap., Zen) Buddhism was violent, iconoclastic, and full of action. K'uang (meaning "violent") Ch'an Buddhism was a refreshing change in the stagnant intellectual atmosphere; it had a significant effect on art, and Tung Ch'i-ch'ang soon found himself caught up in the vortex of this artistic and intellectual movement. Following the direction already set by an older friend of his, Mo Shih-lung (d. 1582/1588), who had identified the new attitude in art with a Ch'an term, calling it the "Southern School of Sudden Realization," as opposed to the "Northern School of Gradual Accumulation," Tung later became the standard-bearer of the new movement and established the course of the late *wên-jên* painting tradition.

In the meantime, young Tung Ch'i-ch'ang could not concentrate on the government examinations, failing them repeatedly. His father, indignant at his dallying in the gentlemanly pastimes of painting and calligraphy and neglecting his studies, would seize and destroy the paper and silk that admirers requesting his work had offered the young artist. Nevertheless, for 15 years he continued to meet with leading figures of both the northern and the southern school, discussing and pondering philosophical and artistic problems. Finally, in 1589, already in his mid-thirties, he passed the examinations, this time brilliantly, having been greatly helped, according to his own account, in his search for himself by the philosophy of Ch'an. He received his *chin-shih* ("Bachelor of Arts") degree and was appointed Compiler of History in Han-lin Academy, thus making a promising start in a government career.

The currents in artistic and intellectual movements at that time were turbulent, and the danger in political strife was grave. Although he held a number of high offices and served the government in many capacities (including that of tutor to Crown

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

Prince Chu Ch'ang-lo, who later became emperor under the temple name of Kuang-tsung), Tung's political experience was a sequence of frustrations. Repeatedly he would leave Peking and return to his home in the south to live in prolonged self-styled "retirements," one of which lasted 15 years (1605–20). He devoted much time to developing his art, particularly his calligraphy. With time and wealth, Tung's long-nourished interest in art and art collecting advanced rapidly. However, in those days there was frequent rioting against the rich, and in 1616 a riot was directed against Tung. For three days the rampage went on; many buildings of the Tung estate were burned to the ground and a large part of his art collection was destroyed or lost. His political ambition in the uneasy years that followed found expression only in his writings and in the comments appended to his compilations of historical documents. About 1625 Tung became president of the Board of Rites at Nanking, and in 1631 he was named head of the Supervisorate of Instruction of the Heir Apparent. He retired officially at the age of eighty; two years later, in 1636, he died of natural causes and was posthumously given the title of Grand Tutor of the Heir Apparent.

His important work, *Shên-miao liu-chung tsou-shu hui-yao* (A Summary of the Memoranda Not Set Down in the Reign of Emperor Wan-li), which mirrored so well the difficult times, remained in manuscript form for more than 300 years, until 1937, when it was published in 14 volumes. A collection of his writings, *Jung-t'ai chi* (Collection of the Office of Ceremonies), which had several editions between 1630 and 1635, was banned by the Manchus in the Ch'ing dynasty and is now a rare item. Many anthologies of his short pieces, mostly on calligraphy and painting, such as the *Hua-yen* (The Eyes of Painting) and *Hua-chih* (Meaning of Painting), were unauthorized and posthumous publications; although they are frequently quoted, they contain many unauthentic entries.

In frustration and disillusionment, art took on additional meaning to Tung Ch'i-ch'ang. He turned again and again to painting for self-expression. His campaign for the "Southern School of Sudden Realization" was imaginative and bold. From his experience of the age-honored practice of copying the ancient masters he arrived at the conviction, which he worded with Ch'an flavor, that the crucial issue is the importance of "unlearning." Freedom from the cluttered and refined atmosphere of the mid-16th century was the direction first sketched out by his friend Mo Shih-lung; and Tung's "unlearning" took the curse of eclecticism off his search for inspiration among the masterpieces. The result was an almost abstract appreciation of form, with particular attention to brushwork and to rich ink gradations. When color was used — more often for its interesting hue than for descriptive purposes — it was naïve and strong. His painting, without any historical or literary narrative theme, rarely had human figures, and the landscape acquired a stark severity. The forms of trees, rocks, and the like yielded to the movement of the brush and the over-all logic of light and dark areas (PLS. 193, 194; III, PL. 284). Thus lines describing the trunk of a tree, the ridge of a roof, or the contour of a rock or a hill would cross one another and the staccato of black and white areas would travel rhythmically along a composition, if necessary without regard to the shaded and lighted areas of the terrain. Tung's calligraphy, too, seemed to express the same interest in the distribution of heavily and lightly inked strokes (PL. 194). It is this separation of formal organization from visual truth that gives his landscapes a pictorial reality of their own; the space in his landscapes thus gains conviction almost by default. In his representation of mountains and water, obvious elegance is avoided and deliberate "awkwardness" is a studied taste. His work was often camouflaged under such declarations as "in the style" or "spirit" of such masters as Li Ch'eng, Tung Yüan, Chü-jan, Kuo Chung-shu, Yen Wên-kuei, and Fan K'uan, of the late 10th and early 11th centuries, and Chao Mêng-fu, Wang Mêng, Ni Tsan (qq.v.), and Huang Kung-wang, of the Yüan dynasty; but Tung painted with a distinctly personal touch in his search for self-identification in the old tradition. While keeping his fighting spirit and inventiveness to the end, he toned down the iconoclastic overtones of his painting in his later days, in the interest of arriving at a more monumental and lasting form, which became his concern as he sensed the success and the importance of his work. He contained all exaggerated tendencies, mellowing into a new richness of interwoven forms at once stable and dynamic.

His work pointed to a new possibility for the reconstruction of landscape, almost as an atonement for his spearheading of the iconoclastic movement in his earlier years. His influence is evident in the expressive and eccentric works of Shih-t'ao (also known as Tao-chi) and Pa-ta-shan-jên (q.v.), on the one hand, and in the seemingly conservative but vital and monumental compositions of Wang Yüan-ch'i (1642–1715), on the other, thus permeating the late 17th and early 18th centuries.

TUN-HUANG. The art center of Tun-huang (probably the Θροάνα of Ptolemy's *Geography*) in the territory of the People's Republic of China (see CHINA, *Kansu*) is the most important of Central Asia (see ASIA, CENTRAL), for both the quantity and the quality of the works that have been found there. On the east it closes the circle begun with Khotan (see KHOTANESE ART) and continued with Kucha and Turfan (qq.v.). Although stylistic elements of Indian and Hellenistic-Roman derivation are present (see GANDHARA), they tend to diminish gradually because of the prevalence of Chinese elements from the T'ang period (see III, col. 510).

SUMMARY. Introduction (col. 328). Architecture (col. 330). Iconography (col. 331). Sculpture (col. 331). Wall painting (col. 332): *Northern Wei period; Sui period; T'ang period to 777; Late T'ang and later periods.* Other painting (col. 335).

INTRODUCTION. The Buddhist complex of Tun-huang is located at the western end of the province of Kansu (northwestern China), about 13 mi. southeast of the town of Tun-huang. For nearly a thousand years (4th–14th cent.) numerous sanctuaries were cut out in an alluvial hill overlooking a river that comes down from the mountains of the Astin Tagh. The oasis of Tun-huang owed its importance to its geographical position, on the borders of China and of the Central Asian regions through which contacts took place with the area called by the Chinese "the western countries," a generic term that included Iran, the eastern Mediterranean, and even western India. In the Han period (206 B.C.–A.D. 221) the town assumed the triple role that it kept for a long time: military outpost, commercial center, and essential caravan halt. The two roads that traversed the whole Tarim Basin, one at the north and the other at the south, met close to Tun-huang, whence they reached the center of China through Kansu. The Chinese emperors were well aware of the importance of this vast caravan route, the Silk Road, which permitted the expansion of Chinese trade toward India and the Mediterranean; therefore they had to maintain the safety of this route, which was constantly threatened by nomad raids, and the position of Tun-huang gave it great strategic value. Moreover, monks from more westerly regions used the Silk Road to reach China, and pious Chinese pilgrims visiting the holy places of Buddhism in India followed it in the opposite direction; hence the importance of the Buddhist sanctuaries of Ch'ien-fo-tung. The art of Tun-huang became the reflection of this constant mixture of influence of diverse origins.

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

According to a 7th-century inscription on a stone tablet (beginning of the T'ang dynasty), the oldest Ch'ien-fo-tung monastery was consecrated by an Indian monk in A.D. 366. From that time onward, the rock-cut constructions multiplied and Tun-huang rapidly became an important religious center; in the 8th century it comprised more than a thousand caves. The building and ornamenting of new cave sanctuaries intensified throughout the period when the region was linked to China under the dynasties that favored Buddhism: the Northern Wei, the Sui, and the T'ang (until the 8th century only). This period of religious activity coincided with the times when China was expanding toward the west and strengthening its relations with India, then with Nepal and Tibet (qq.v.). In the middle of the 8th century Tibetan incursions into China brought about the fall of Tun-huang (777 or 778), and the region remained subject to the Tibetans until 848. Thereafter the oasis never regained its earlier importance, for the Tibetan occupation of the southern part of the Tarim Basin brought about a change in the route followed by the caravans, which from then on used the Northern Road, rejoining Ansi (An-hsi) about 81 mi. northeast of Tun-huang and leaving the oasis well away from the main trade routes. After the Tibetan occupation, the area was ruled for two centuries by local noble families — first the Chang, then the Ts'ao, who restored the damaged sanctuaries and even consecrated new ones up to the 10th century. In the 11th century the region was subjected by the Tungus (of Tibetan origin) and formed part of the Hsi-hsia kingdom (1001–1227). After that it was linked to China by the Yüan dynasty (1260–1368), but the Buddhist site continued to decline in importance, although several restorations and new foundations were still made at Ch'ien-fo-tung. In the 19th century what was left of its religious activity was divided between the Buddhists and the Taoists (see TAOISM); but the complex still remains a place of pilgrimage.

The artistic wealth of Ch'ien-fo-tung was first revealed to the world by the publications that followed site explorations by several foreign missions. Since the beginning of the 20th century, various expeditions have visited Tun-huang: English (Aurel Stein), French (Paul Pelliot), Russian (P. K. Koslóv), Japanese (Otani), and American (Langdon Warner). Since 1943, when the Tun-huang Research Institute was set up, the Chinese government has undertaken extensive work to clear the caves of sand, to restore the stairways and access passages, and to reinforce the vaults, paintings, and sculptures. Additional sanctuaries have been discovered; copies of paintings and photographs in color have been exhibited and published. Earlier paintings have sometimes been found underneath more recent layers. The caves, which were first numbered by Pelliot, have been renumbered (in this article the Tun-huang Research Institute number is given, followed by the equivalent Pelliot number designated by a P).

According to the census made under the direction of Professor Ch'ang Chou-hong (1959), there are at present 486 caves, divided chronologically in the report as follows: 32 caves of the Wei period (386–534), 110 of the Sui period (581–618), 247 of the T'ang period (618–907), 36 of the Five Dynasties period (907–960), 45 of the Sung period (960–1001), and 8 of the Yüan period (1227–1368). Some ten caves were rebuilt and redecorated under the Hsi-hsia rule (1001–1227).

ARCHITECTURE. The cliff in which the sanctuaries were hollowed out is $1^1/_4$ mi. long. In the central part, which is higher, the caves are built above one another on four or even five levels, but at the ends there are only one or two levels. Each sanctuary opened onto a wooden veranda by means of a short passage; these verandas, which have generally disappeared, rested on beams fastened into the cliff. The sanctuaries on the same level were connected with one another by an external gallery, while stairways connected the levels. The caves varied according to the period in their plan and in the cutting of the ceiling as well as in the distribution of the paintings and statuary (FIG. 330).

The tradition of rock-cut sanctuaries and monasteries — adopted in China from the Wei period onward, as is attested by the numerous caves at Yün-kang (5th–6th cent.; see III, col. 445) and those at Lung-mên (6th cent.) — probably passed to northern China from India by way of regions such as Bamian in Afghanistan (see INDO-IRANIAN ART) and Kizil (Kyzyl; Qyzyl) in the Tarim Basin. Each region, however, modified the traditional ideas and created forms peculiar to itself. Development and changes also took place at Tun-huang, just as they continued to do in the latest sanctuaries of the Tarim Basin, in the Turfan district.

The Tun-huang caves dating from the Northern Wei period, the oldest extant, are generally fairly small. Professor Ch'ang Chou-hong, director of the Tun-huang Research Institute, has divided them into two groups. The first type (FIG. 330, *a*) seems to derive from the vihara (Buddhist monastery) in India. The main hall is rectangular but less deep than wide. A niche of particular importance for a statue of the Buddha forms a recess in the wall facing the entrance. Small cells are hollowed out of the lateral walls, while a large but low square pedestal occupies the middle of the hall. The ceiling is divided into four sloping sections with a square coffer in the center. The plan of the caves of the second type (FIG. 330, *b*) is reminiscent of that of the oldest rock-cut caves in the Tarim Basin (Kizil and Kumtura). It is still rectangular, but this time extended in depth. Toward the back, and separated by a passage from the back and side walls, a massive quadrangular pillar has been left standing (not cut away) in the mass of the rock. There is a large niche on the front of the pillar, while smaller niches are arranged on the other sides and often on the lateral

Tun-huang. Caves of the Thousand Buddhas, plans and sections of typical caves. Northern Wei period: (*a*) Cave 285 (P120N), (*b*) Cave 254 (P105). Sui period: (*c*) Cave 420 (P136E). Late T'ang period: (*d*) Cave 196 (P63) (*from Fourcade, 1962*).

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

walls of the cave. The front part of the cave thus constitutes a large quadrangular hall, with a pessage left, in the process of cutting, on the three sides of the pillar for the ritual *pradakṣiṇā*, the circumambulation around the cult image placed in the large niche facing the entrance. The ceiling has a shape that was unknown at Kizil, with its two sloping sides perpendicular to the main axis.

From the Sui period on, the plan was simplified (FIG. 330, *c*). The sanctuary is square, surmounted by a four-sectioned ceiling and a central coffer — a type that was still used centuries later. During the Sui period there were two variations in the arrangement of the main hall: in one type, a high pedestal was left in the center, in the process of cutting, to support the cult image and those which accompanied it; a rather small niche was hollowed out in each wall. The other variation left the center of the room clear but transformed the back wall into a wide, deep niche to admit the often numerous statues. A plan fairly similar to this was still in use in the T'ang period, when the disappearance of the lateral niches increased the surfaces available for paintings so that large compositions could take their place on the walls. Toward the end of this period the large niche in the back wall disappeared in its turn. The statues were placed on a large platform, not touching the back wall but projecting on both sides; the chief cult image was set against a pillar of fairly small diameter (left in the process of cutting) that rose up to the ceiling (FIG. 330, *d*). A similar arrangement is found in a cave at Shorchuk that must be of nearly the same date: there, in Cave 8, the same importance is given to the platform with the statues and it has the same shape, but the pillar left in the process of cutting takes up the full width of the back. Despite their differences, the changes that took place at the sites in Chinese Turkistan and at Tun-huang were analogous, since they followed a similar development of rites and beliefs.

ICONOGRAPHY. Mahayana ("Great Vehicle") Buddhism predominated at Tun-huang from the Northern Wei period on, as it did in northern China. The iconography is therefore quite similar to that of the same period in Yün-kang and Lung-mên; later it developed and new themes came into vogue. The Buddha Śākyamuni is at first often the chief image, in painting or in sculpture, and his life and previous existences (Jātaka episodes) are recalled in picturesque scenes. Sometimes he is accompanied by Prabhūtaratna, a Past Buddha with whom he talks and who shares his throne. The Mahayana pantheon is enormous; the seven Buddhas of the Past, Maitreya (the Future Buddha), the five metaphysical Buddhas (Dhyani Buddhas), and the bodhisattvas (compassionate beings whose cult grew during the Sui and T'ang periods) are represented and worshiped. In this period the representations of Śākyamuni did not completely disappear, and at the end of the 8th century his entry into Nirvana was still recalled by a large statue in Cave 158 (P19bis). The importance of the bodhisattvas became, however, preponderant, especially Avalokiteśvara (Kuan-yin), who rescues human beings in danger, and Kṣitigharba (Ti-ts'ang), who improves the conditions of rebirth. In mural and other paintings the paradises are a favorite theme, particularly Sukhāvatī, the Paradise of Amitābha. Portraits of the great disciples (lohans) made their appearance, as in T'ang China, and took on the same ascetic aspect. The Tun-huang paintings correspond to religious texts and generally to a Sūtra that was especially popular at the time they were painted.

SCULPTURE. Although painting assumed a preponderant position in the Tun-huang sanctuaries, the role of sculpture there was not negligible. Cult images, bodhisattvas, guardians of the temple and of the world (*dvārapālas* and lokapalas) occupied the wall niches or were arranged on bases or, later, on large platforms. These figures in relief were done mainly in a fairly coarse material: modeled in clay or plaster, dried and painted. Small statues were sometimes cast; the most important ones were first summarily built on an armature of reeds, rushes, or wood, then modeled in finer material. Various works were done in a harder agglomerate, some in wood (PL. 200). The quality of the sculptures perhaps equaled that of the paintings, but many have been restored or altered and have thus lost their original appearance. The works are similar to those done at the sites in China proper in the same period; and from the Northern Wei to the Yüan period, an almost parallel development continued in the two regions, both in style and in iconography. The compositions for a long time closely associated the figures in relief with the paintings that surrounded them; sometimes, indeed, various parts of painted figures were executed with thick layers of paint to lend relief. In the Northern Wei period the images were backed against the wall, on which the halos, aureole, canopy, and heavenly beings who accompanied them were painted (PL. 196). Later the statues became more independent of the wall and many were completely separated from it.

In the Northern Wei caves Śākyamuni or Maitreya most often occupies the main niche; sometimes Prabhūtaratna is associated with Śākyamuni. The sculptures are similar to those of the same period at Yün-kang. One finds the same seated postures, those called Indian or European style and the position of "royal relaxation" — that is, one leg flexed horizontally while the other is pendent; elsewhere the legs are crossed horizontally at the level of the calf, as they sometimes are in Gandhara, at Shotorak (Afghanistan), and often in the paintings of the Tarim Basin. The large monastic cloak (saṅghāṭi), borrowed from the Indian tradition, is draped in two ways: in one, it covers both shoulders ("covered" scheme), with its edges separated at the front of the body (as at Yün-kang) so as to show the undergarment, which passes under the armpit to leave the right shoulder free; in the second, the undergarment is more visible since the cloak covers the left shoulder only ("open" scheme), with an edge, however, drawn over the right shoulder, on which it curves according to a style which can be seen at Yün-kang (II, PL. 382, *left*) and which is found in later Chinese art and in that of the Tarim Basin. Sometimes the influence of this last region, intermediary between India and China, appears in the Buddha's draping (Cave 259, P111), as well as in the costumes of the richly attired bodhisattvas, who are clothed in the Indian dhoti, with a scarf looped around their nude torsos.

Sculpture subsequently developed along the same lines as in China proper: with the sense of volume of the Sui period, the roundness given to the contours, and the treatment of the folds in incurved lines. The bases of the seated Buddhas are partly masked by their cloaks, which fall decoratively down over them, making symmetrical folds and wavy edges. The Buddhas seated in the niches are framed by standing attendants: at first there was only one on each side, but during the T'ang period the number of the attendant bodhisattvas, with elegant outlines and rich ornamentation, was increased in the deep niche hollowed out in the back wall. Alongside them are placed the *dvārapālas*, in a more or less dynamic posture; these are always clothed in the costume of Chinese warriors, and their faces have assumed the menacing expression that became more pronounced in T'ang China. Thus two aspects of the trends in Chinese T'ang art are juxtaposed in these Tun-huang sculptures (as also in the paintings): the grace and sweetness (sometimes a bit affected) of the heavenly beings and the vigor (often somewhat caricatural) of the temple guardians or ascetics.

WALL PAINTING. Every wall and ceiling of the Tun-huang caves was covered with paintings, whereas at Yün-kang and Lung-mên they were covered with sculptures. The Tun-huang site therefore completes the data that the Chinese sites can supply for scholars' knowledge of art in the Northern Wei, Sui, and T'ang periods, even though the art of Tun-huang was slightly marginal to that developed in China proper. Like the paintings on the Mai-chi-shan site, farther east, the Tun-huang paintings (PLS. 195, 196, 199) of the Northern Wei and Sui periods reveal the forms and influences received from more westerly regions; these influences often reached the Far East, modified by their transit through one site or another. Later the Tun-huang paintings resumed this role of intermediary in the migration of motifs and influences, but from east to west,

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

that is to say, in the opposite direction. The Tun-huang works, strongly marked by the esthetics developed at the T'ang court, served as models for painters from eastern Turkistan; in this way Chinese influences dominated in the sites of the Turfan region, at Shorchuk, and even in the later caves of Kumtura.

The painting technique at Tun-huang was fairly simple. Layers of clayey mud were applied on the rough walls, and chopped straw and animal hair were added to these layers; once a smooth surface had been made, it was covered with a layer of fine clay (kaolin) mixed with pulverized chalk and animal glue. A gum was mixed with the colors for a tempera ground. The rough sketch was first drawn with a stylet or a piece of charcoal, and the contours were then gone over with ocher or India ink. Pounced drawings, cut out or perforated, were sometimes used, as were pins and short cords to trace the round nimbuses and the architectural lines. The colors, of animal or plant origin, included, among others, red ocher, green malachite, azurite, black (from soot or charcoal), indigo blue, and vermilion (obtained from cinnabar). Various kinds of white existed: white lead, often used as an undercoat during the Northern Wei period, thickened the lines and modified the effects as it oxidized; a more delicate white was obtained from pulverized chalk; another came from crushed mother-of-pearl found in fresh-water shellfish, but this was much less often used, usually being reserved for textiles.

Northern Wei period. Influences from India — the themes, the iconographic traditions, and the adoption of mythical beings such as the apsarases, or female heavenly musicians — are found in Wei paintings at Tun-huang. But the Indian contributions arrived through the ancient sites in Afghanistan and the Tarim Basin, where they were stamped with a new spirit; there, as at Tun-huang, they mixed with Iranian elements. The Tun-huang painters in their turn interpreted these forms freely, sometimes according to the imagination of the individual painter, sometimes according to trends that came from metropolitan China, whether contemporaneous or inherited from earlier artistic production. In this way original works were created.

These influences, reinterpretations, and innovations are evident in the diverse aspects of the paintings. In important symmetrical compositions a large Buddha in majesty is surrounded by adorned bodhisattvas and by disciples or heavenly beings of short stature, standing or flying. This scheme passed from the Buddhist art of India to that of the Tarim Basin, from which the Tun-huang painters borrowed the nimbus of multicolored circles edged with stylized flames, and often the decorated canopy and flowering tree above the Buddha. But many of the figures were idealized, elongated as in the Northern Wei sculptures; chiaroscuro effects were sought through the modeling and through touches of light colors. Bamian and Kizil were the intermediary regions from which Tun-huang borrowed the friezes of heavenly musicians, who, framed with arcading, above a conventional balcony emerge from the waist up (Cave 251, P103); as in the prototypes, the projections, recesses, and beam ends are treated simply as surfaces to be decorated. Among the most typical of the themes borrowed from Central Asia and from Iran and western Asia Minor are those relating to the sun and the moon, which were sometimes suggested by the disks held up by a genie with outstretched arms, sometimes represented in their chariots (see also II, col. 81). In the latter case the interpretation of the Sun's quadriga became aberrant, as it did at Kizil and Kumtura. Coffer motifs, with concentric squares arranged as if they were a framework of beams (Cave 249, P101), were borrowed for ceilings inspired by the woodwork of these sites. Many ornamental details are of western origin, often Iranian: the arcading and bands in which polylobate leaves are juxtaposed, set against each other, or arranged in scrolls; the checked and squared effects recalling mosaics.

Various episodes from the life of the Buddha Śākyamuni and from his previous incarnations (Jātakas) are depicted. But though the pictorial narrative still follows the ancient texts and goes back to traditional poses and details, a new life is breathed into the whole by the liveliness and spontaneity of the movements — unknown at Kizil — and by the greater freedom of composition. Often empty spaces lighten the scenes and isolate the figures, thus avoiding the dense grouping of the Indian tradition. Chinese architectural styles with overhanging roofs were introduced; they are shown at an angle and follow the rules of perspective that always prevailed in China. Landscape elements of a special kind sometimes serve as a setting for a Jātaka. Mountains are suggested by variously colored, irregularly triangular masses, overlapping slightly and aligned horizontally or diagonally to separate different episodes; and a few slender trees are dotted about on the light background (Cave 257, P110). These series of schematic mountains have often been compared to the border motifs on Sassanian silver plates (see SASSANIAN ART); they also recall the landscape elements that appear on metal objects, terra-cotta plaques, and stone slabs from the Han period: the winding undulations of the lines of the soil, the roughly triangular outlines of the rocks, and, in this fanciful setting, horsemen or animals springing about, as they do in the paintings at Tun-huang.

The same Chinese source seems to underlie the very free compositions that decorate the sloping ceiling sections. On a creamy background the most varied creatures are scattered about in a wild whirl: arched apsarases with long scarves, acrobats, winged demons hurling themselves toward one another, mythical animals, birds and dragons with sinuous necks and long arched bodies, suggested as much as depicted (Cave 285, P120N). This exuberant fantasy (II, PL. 390; III, PL. 244) is a continuation of that revealed in the cosmogonic representations on the Wu Liang-tz'ŭ funerary slabs (2d cent.; see III, cols. 449, 494). In contrast to these compositions, and to the mobility of the flying figures and the scarves, whole walls are covered with the "Thousand Buddha" theme (*ch'ien fo*; PL. 196) — row upon row of Indian-style seated Buddha figures (Cave 272, P188J). These alignments are similar to the ones treated in bas-relief in the caves of the same period in Yün-kang, and the same theme appeared in the later paintings at Tun-huang and in the Turfan region. Another type of decoration of the Northern Wei caves also appeared in these later paintings: the rows of triangles and pendants arranged like lambrequins at the edge of the coffers of various ceilings. A stylization of the fringes of textiles seems to be at the origin of this motif, as it was for others, especially later.

Sui period. The paintings of this period are among the most delicately executed. They show a progress in technique as well as an enrichment indicated by the range of colors, precision in details, more subtle modeling, and elegance of forms. The use of gold leaf for various parts of the costume and for the jewelry enhances the exquisite effect of the pure lines of the drawing. Symmetrical compositions of the Buddha in majesty, framed by attendants, are numerous. The costumes are increasingly Chinese, as in the sculptures of the same period in Yün-kang and Lung-mên. A new wave of Indian influences, nevertheless, appeared in the hand gestures — a bit mannered, but very expressive — and in the ornamentation on the backs of thrones, with mythical beings, including misconceived descendants of the lions rampant and the *makaras* (aquatic monsters) of India. A few Iranian-Sassanian contributions also appear — medallions or lozenges picked out in pearl design on costumes and rows of large pearls bordering the compositions. Nevertheless, the Chinese character of the paintings becomes accentuated in the landscapes and buildings, as in the elegant lady donors (III, PL. 238), who are more freely grouped than in the Northern Wei period and who recall the graceful funerary statuettes of the same period. Themes that were to continue were introduced, such as the encounter between Mañjuśrī (Wên-shu) and Vimalakīrti (Wei-mo).

T'ang period to 777. Tun-huang painting was at its apogee from the beginning of the 7th century to the Tibetan occupation of the region in 777. During that time larger compositions were spread on the walls and arranged with a predominant concern for clarity and order; the colors are harmonious and

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

subtle. The contours are rounded, the line sometimes emphasized, and the modeling accentuated, with a view to giving a sculptured effect to the painted figures. The groups are balanced, although they are arranged freely; often a pleasing effect is derived from the contrast of light and dark flesh tints. In the representation of the Buddhas and bodhisattvas the idealization of the human form successfully answered the need to express metaphysical concepts through it; but later repetition of the same types was to render them conventional and often meaningless.

A search for realism, sometimes even for violence, was juxtaposed with this idealization of the form, this search for a rather bland sweetness. As in the Chinese works of the same period, evidence of this can be found in two groups of characters: the dynamic lokapalas (guardians of the universe) and the great emaciated disciples (lohans), their faces distorted by the stress of thought. Concern for realism appears, too, in the small scenes of daily life that accompany the large compositions, and in groups of lay people, where men of every race mix and are clearly differentiated by their features and their dress. The representations of the Chinese donors, both male and female, are intended as portraits.

From the 7th century onward ancient themes such as the Jātakas lost favor, while new ones were adopted; among these, the representations of paradise were inspired by the *Saddharmapuṇḍarīka* (Lotus of the True Law), from the Kumārajīva translation (406), several copies of which have been found at Tun-huang. The theme lent itself to vast symmetrical compositions in the center of which sits enthroned the buddha to whom the paradise is related. The Paradise of Amitābha (Sukhāvatī) is the most frequently represented. The principal figure, large in proportion to the others, is surrounded by bodhisattvas, numerous deities, and groups of heavenly musicians and female dancers. The flying figures, with long fluttering scarves, are particularly graceful. These figures are harmoniously distributed in an architectural setting of palaces, terraces, and bridges spanning the lotus pond. An effect of depth is obtained by the perspective of the buildings, whose oblique lines lead toward multiple vanishing points. The feeling for space is especially noticeable in the landscapes: picturesque groups of people and animals are framed by mountains with towering summits, by rivers whose windings lead to a distant horizon placed high up in the composition, or by buildings that reproduce the religious or civil architecture of the time (houses, fortresses, pavilions, or gates). These mural paintings are particularly interesting because they show one of the stages in the development of the Chinese landscape, as do the rare engraved slabs and wash drawings of about the same period; they presage the sense of vastness that was to develop in the Sung-period scrolls, and sometimes an airiness, as when simple touches of diluted color (often greenish) shading the surfaces create an illusion of open air (Cave 156, P17 bis; mid-9th cent.).

Late T'ang and later periods. From 777 on, the activity of the Tun-huang painters was slowed down, if not halted, by the Tibetan occupation. When the occupation ended in the middle of the 9th century, the same subjects with the same approaches were revived, as they were also at another site, Yü-lin-k'u (Wan-fo-hsia), near Ansi, where representations of paradises attributed to the 9th century are found. The Tun-huang painters, moreover, must have worked in the secondary communities established in the area, such as Hsi Ch'ien-fo-tung, 20 mi. southwest. At the end of the 9th century the Chinese character of the paintings became more marked; a certain poverty of invention appeared and the types had a tendency to become conventional. These aspects were to remain in the later examples, in which the workmanship became more mechanical; activity was directed mainly to repairing or altering the ancient paintings.

Other painting. Tun-huang is known not only for the mural paintings but also for the paintings that adorn banners of fabric and for images on paper. A whole collection of these, concealed in a walled-up hiding place in the 11th century, was discovered there in the 20th century. Many were acquired by the Aurel Stein and the Pelliot missions; they form part of the collections of the British Museum and of the Musée Guimet, Paris. These paintings, mostly votive works, were executed on silk, hemp, or paper. Some must have been hung on the walls, others suspended from the ceiling, and the smallest and humblest, roughly executed on paper, must have been deposited as offerings. These paintings, made between the beginning of the 8th century and the end of the 10th, show T'ang stylistic tendencies and subjects mixed with other influences. The quality of the works is far from uniform; some of the banners are carefully executed, with vivid but harmonious colors; others are of a conventional style and show the use of pounced drawings; while still others are clumsily and hastily sketched.

The great Mahayana themes appear among these paintings; the various buddhas, bodhisattvas, and lokapalas are depicted, alone or joined in more complex compositions. The illustrations of the paradises are arranged in the same way as in the mural paintings (PL. 197). Several banners are especially devoted to two bodhisattvas: Ksitigarbha (Ti-ts'ang), who is often surrounded by the judges of the underworld, and Avalokiteśvara (Kuan-yin; PL. 198), the great savior, often surrounded by human beings in danger or equipped with a thousand arms to express the extent of his compassion — the same aspect that was adopted in the cave paintings of the mid-9th century (Cave 156, P17 bis). On some banners are to be found deities or Tantric symbols that show Nepalese-Tibetan influences. Many compositions are symmetrical; the density of the groupings and the juxtaposition of vivid colors recall the paintings of Central Asia. Other compositions are more free and airy, with softer and more subtle tonalities; thus they bear more resemblance to the esthetics of the Chinese painters of the T'ang period.

TURA, COSMÈ. Principal master of the 15th-century Ferrara school of painting, also active as a sculptor and designer (b. 1430 and d. 1495, Ferrara).

SUMMARY. Chronology (col. 338). Works (col. 339). Stylistic development (col. 340).

Court painter for Duke Borso d'Este, Cosmè (Cosimo) Tura was considered the leading artist in the Este domain and was overwhelmed with commissions, not only from the court but also from the Church and from private sources. Early in his career his fame spread far beyond the boundaries of his native region. Filarete (Oettingen, 1896, p. 2) ranked Tura with Filippo Lippi, Piero della Francesca, Andrea Mantegna, and Vincenzo Foppa (qq.v.); and Giovanni Santi (Padovani, 1954, p. 41) considered him to be on a level with Antonello da Messina, the Bellini brothers, Ercole de' Roberti, and Melozzo da Forlì (qq.v.). However, in 1471, with the death of his enthusiastic patron, Duke Borso d'Este, Tura's popularity began to dwindle appreciably, and in 1486 Ercole de' Roberti replaced him at the court. Reduced apparently to poverty and overtaken by the onward march of art, Tura seems to have died in obscurity. Toward the end of the 16th century there was a revival of interest in his work, during which his name stood out in the local chronicles as the most illustrious in Ferrarese art history. In the second half of the 19th century documentary research began to reconstruct the personality and trace the influence of the master; the extant works attributed to him were restudied in an effort to establish his *œuvre*. Since then critics have come to consider Cosmè Tura one of the foremost masters of the early Italian Renaissance.

CHRONOLOGY. The documents relating to Tura's life and *œuvre* have been collected and published principally by L. N. Cittadella (1866), G. Campori (1876, 1886), and Venturi. By 1451 Tura was already considered such an authority on art that he had been assigned, together with the painter Galasso di Matteo Piva, to appraise the paintings of Jacopo Turola. Beginning in 1452 Tura drew a regular salary from the court; in the same year he was busy with commissions for decoration, a type of work that occupied much of his attention throughout his creative period. He decorated a jousting helmet with the Este emblems and painted a banner for the tailors' guild of Ferrara, which he altered four years later. In addition he decorated, with Giovanni Carlo di Bretagna and the miniaturist Giorgio Tedesco (d'Alemagna), a large number of chests.

From 1453 to 1456 there are no documents referring to Tura; evidently he spent these four years away from Ferrara, probably in Padua, according to Venturi, for his style seems to indicate a careful study of the decoration, by Andrea Mantegna (q.v.), of the Ovetari Chapel in the Church of the Eremitani there. Furthermore, a passage in Tura's first will (dated 1471) implies a long stay in the Veneto region, which could have taken place only during the years in question.

In 1457 Tura was again in Ferrara, where he was assigned quarters in the castle. From this time on he concentrated on an area of art to which he remained faithful for several decades: the designing of tapestries. His motifs were principally heraldic and decorative, although he designed several figural tapestries; two versions of one of them, woven by Lieven Gillisz., are extant (see below).

Tura's earliest known painting is a small Nativity of 1458 (now lost) for the Cathedral of Ferrara. Between 1459 and 1463 he was designated *Depintore dello Studio* and was the chief artist for the decoration of the *studiolo* of the Este castle of Belfiore in Ferrara; a number of other artists worked both with him and for him on the project. At Belfiore, as previously, the work consisted principally of decorative designs, but there were some paintings with figures as well: according to a manuscript by Ludovico Carbone (*De amoenitate, utilitate, magnificentia Herculei Barchi*, 1472) a cycle of the nine Muses begun by Angelo Macagnini, Tura's predecessor in charge of the work, was continued after Macagnini's death (Aug. 5, 1456) by Michele Pannonio and finished by Tura after 1459. In this period Tura resumed his work on tapestry designs. From 1459 to August, 1462, there are no references to other works, but documents of 1462 and 1464 show payments for decoration of armaments and jousting equipment made for several persons. There are no records of the artist's activity from 1465 to 1467. According to Venturi (1885) Tura spent this time in Mirandola, decorating the library in the Pico Castle with allegorical figures. L. G. Giraldi (*Operum quae extant omnium*, Basel, 1580) gives a detailed description of these decorations and names Tura as the probable artist. By the end of 1467 Tura was back in Ferrara, where he was paid on Dec. 31 for tapestry cartoons.

The second of Tura's masterpieces (now lost) was produced in 1467–68: the decoration of the Capella Sacrati in the Church of S. Domenico, Ferrara, including frescoes with New Testament themes and an altarpiece with the Adoration of the Magi. Another masterpiece followed immediately, the great paintings of the organ door for the Cathedral of Ferrara (PLS. 202, 203, 208), for which Tura was paid on June 11, 1469. This is the earliest unequivocally documented work by Tura still in existence (Ferrara, Mus. dell'Opera del Duomo). Vasari mentions both works.

The frescoes in the Hall of the Months of the Palazzo Schifanoia in Ferrara were painted 1469–71. According to several sources Tura was the chief master of this painting cycle, which was the work of several artists. He furnished a series of sketches that were followed by other painters and a complete fresco, *September*. His fellow workers were Francesco del Cossa

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

(q.v.) and Antonio Cicognara; later these were joined by Baldassare d'Este and an anonymous artist. At about the same time Tura, then at the height of his career, was in charge of the painting and sculptural decoration of the chapel of Belriguardo Castle in Voghiera. Here Tura had two anonymous assistants, with whose help he produced a number of frescoes (God the Father, the Evangelists, and the Church Fathers) and decorative carvings. Baldassare d'Este and the Venetian painter Antonio Orsini submitted a detailed assessment dated Mar. 31, 1472. The church — probably on a central plan with a dome — along with its decorations has been destroyed.

At the time of completion of this great work Tura wrote his first will, dated Jan. 14, 1471, which shows him to have been a wealthy man. In the same year Duke Borso died and Tura executed the decoration of his tomb. Subsequently he took part in the preparations for the marriage of Duke Ercole I d'Este to Eleanor of Aragon, which was celebrated with great pomp and ceremony. His principal project was the design of an elaborate silver service, which was made by the Venetian goldsmith Giorgio Alegretto da Ragusa. In addition Tura painted two portraits in 1472: of Duke Ercole I and of Lucrezia d'Este (both lost). Again in 1473 and 1474 he was busy with tapestry designs. In 1474 he also completed one of his most important works: the Roverella Altarpiece for the Church of S. Giorgio fuori le Mura in Ferrara. Most of this altarpiece is extant, although the parts are now scattered. R. Longhi (1934) has made an effort to reconstruct this great triptych, but his work has not been universally accepted. The main panel (PLS. 206, 207) is in London (Nat. Gall.), the right panel (PL. 205) in Rome (Gall. Colonna), a fragment of the left panel (head of St. George) in San Diego (Fine Arts Gall.), and the lunette (PL. 204) in Paris (Louvre). The paintings of the columns and of the predella and the two half-figures over the side panels are lost.

In 1475, besides executing several new tapestry designs, Tura painted a portable altar for Duke Ercole I that had been carved by Bernardo da Venezia and decorated in niello by Amadio da Milano. Four panels that probably formed part of this altar are in Washington (Nat. Gall.). In 1477 Cosmè completed three portraits (now lost) of the year-old successor to the throne, Alfonso d'Este.

Among the documented works of subsequent years, the most important are some allegories with nude female figures. Four of these figures, already painted when Tura received the commission, required only retouching; three others were new works by the artist. Apparently these comprised a cycle of Virtues, said to be designed for the duke's study, a room often identified with the *studiolo* at Belfiore on which Tura had worked in 1459–63. This identification is for several reasons unlikely, but for the present it is not possible to determine the location more exactly or to identify the feminine nudes with any existing allegories of Tura and his group. Possibly the drawing of a nude Charity (?) in Berlin (Kupferstichkab.) is related to this cycle. In 1479, in addition to tapestry cartoons, Tura painted a portrait of Lucrezia d'Este, and in 1480 one of Isabella d'Este (both lost). The records also mention a tapestry with the story of Solomon (1480), woven by Rubinetto (Rubino) di Francia from a cartoon by Tura. The large *St. Anthony* for the altarpiece of the Church of S. Niccolò in Ferrara (Modena, Gall. Estense) has been definitely dated from the records as belonging to 1484. Between 1483 and 1485 Tura designed a silver service for Lodovico il Moro, and in 1485 he painted a portrait (lost) of Beatrice d'Este as Lodovico's bride. The *Compilatio Astronomica* of Alfraganus (al-Farghâni), published in Ferrara in 1493, includes a woodcut illustration that reflects Tura's style and mode of interpretation and is probably after a drawing by him.

WORKS. There are certain symbols on some of Tura's works that have been considered as signatures, although with doubtful justification; all the existing works must be presumed to be unsigned and undated. The dates assigned to them are based on the study of his presumably or definitively authentic works. The definitive works are the organ door (1468–69) in Ferrara, the Roverella Altarpiece (1474), the portable altar of Ercole I (1475), and the altarpiece for the Church of S. Niccolò in Ferrara (1484). These are the masterpieces whose common features show a clear picture of Tura's style and whose slight differences throw a certain amount of light on the development of his style.

Considering that Tura is known to have worked as a painter of frescoes and other types of pictures and as a sculptor, a draftsman, and a designer and that he also retouched the works of other artists and made use of assistants and apprentices (some of them known by name), the extant works may be divided into the following categories:

Works by Tura. a. Paintings (in their probable chronological order): *Portrait of a Young Prince of Este* (Met. Mus.). – *St. John the Baptist and St. Peter*, two joined panels in antique frames (Philadelphia, Mus. of Art, Johnson Coll.). – *Madonna with Zodiac Mandorla* (Rome, Gall. Colonna). – *St. George on Horseback* (Manor House, near Mells, Somerset, Asquith Coll.). – *Madonna with Sleeping Child*, in antique frame with painted lunette (Venice, Acc.). – Altarpiece for Church of S. Maria della Consolazione, Ferrara: *Virgin with SS. Jerome and Apollonia* (Ajaccio, Mus. Fesch); predella paintings: *Annunciation* (Rome, Gall. Colonna), *St. Maurelius* (Milan, Mus. Poldi Pezzoli), *St. George and the Dragon* (Venice, Coll. Cini). – *Portrait of a Man* (Washington, Nat. Gall.). – Allegorical figure, Venus (or Spring ?; PL. 201; London, Nat. Gall.). – Two tondos from St. Maurelius Altarpiece for Church of S. Giorgio fuori le Mura: *Condemnation and Execution of St. Maurelius* (PL. 204; Ferrara, Pin.). – *Madonna in the Garden* with (above) *Annunciation* (Washington, Nat. Gall.). – Organ door for Cathedral of Ferrara: *Annunciation* (PL. 203); *St. George Slaying the Dragon* (PLS. 202, 208; both, Ferrara, Mus. dell'Opera del Duomo). – *St. John at Patmos* (Genoa, Coll. Gnecco). – *Crucifixion* (Cambridge, Fitzwilliam Mus.). – *Pietà* (XII, PL. 36; Venice, Mus. Correr). – Three tondos: *Adoration of the Magi* (Cambridge, Fogg Art Mus.); *Circumcision* (Boston, Isabella Stewart Gardner Mus.); *Flight into Egypt* (Met. Mus.). – Roverella Altarpiece for Church of S. Giorgio fuori le Mura, Ferrara: *Madonna and Child Enthroned* (PLS. 206, 207; London, Nat. Gall.); *SS. Paul and Maurelius with Nicolò* (?) *Roverella* (PL. 205; Rome, Gall. Colonna); head of St. George, fragment of left panel (San Diego, Fine Arts Gall.); *The Lamentation* (PL. 204; Louvre). – Portable altar of Duke Ercole I: *Annunciation* (in two panels, one of Archangel Gabriel and one of Virgin); *St. Francis*; *St. Maurelius* (all, Washington, Nat. Gall.). – Altarpiece for Certosa, Ferrara: *St. Jerome* (London, Nat. Gall.); Crucifix (Milan, Brera). – Altarpiece for Church of S. Luca in Borgo, near Ferrara: *St. Sebastian* and *St. Christopher* (Berlin, Mus. in Dahlem). – Polyptych: *St. James* (Caen, Mus. B. A.); *St. Anthony of Padua* (Louvre); *St. Dominic* (Uffizi). – Altarpiece for Church of S. Giacomo, Argenta: *Madonna with Blessing Child* (Bergamo, Acc. Carrara); *St. Louis of Toulouse* (Met. Mus.); *St. Nicholas of Bari* (Nantes, Mus. B. A.); *Pietà* (Vienna, Kunsthist. Mus.). – Altarpiece for Church of S. Niccolò, Ferrara: *St. Anthony* (Modena, Gall. Estense). *b. Frescoes*: Hall of the Months in Palazzo Schifanoia, Ferrara: *September*; the Virgo of *August*; right half of lower frieze of *July*; equestrian group on east end of south wall. *c. Sculpture*: *Pietà*, painted terra cotta (formerly Florence, Coll. Ventura). *d. Drawings*: Mercury (Bayonne, Mus. Bonnat). Christ (?) at the Pillar (formerly Berlin, private coll.). – Vesta with candelabra (retouched; Vienna, Albertina, Inv. No. 2579). – Charity (Berlin, Kupferstichkab.). – Pietà (retouched; London, F. Drey Coll.). – Church Father (Bayonne, Mus. Bonnat). – Madonna with SS. Sebastian, Francis, Dominic, and Agatha (Br. Mus.). – Hercules with the lion (Rotterdam, Mus. Boymans-Van Beuningen). *e. Other works*: *The Lamentation*, tapestry (Cologne, Coll. Neven-Dumont; variation, Cleve. Mus.). – *Alfraganus and Eremita*, woodcut illustration (Ferrara, 1493).

Selected works partly by Tura or of his school. a. Paintings: *Charity*, putti by Tura (Milan, Mus. Poldi Pezzoli). – Virtue (Hope ?), lower part of robes by Tura (Florence, Coll. Strozzi). – *Annunciation* (London, Nat. Gall.). – *Portrait of an Old Man* (Milan, Mus. Poldi Pezzoli). – *Pietà* (copy ?; Chicago, Art Inst.). – *Madonna with Sleeping Child* (formerly Rome, Coll. Paolini). *b. Decoration*: Painted box (Reggio Emilia, Mus. Civ.). *c. Drawings*: Christ Child blessing (copy ?; Br. Mus.). – Two standing men (Vienna, Albertina, Inv. No. 33).

STYLISTIC DEVELOPMENT. According to Vasari, Tura's teacher was the painter Galasso (possibly the same Galasso di Matteo Piva who appears in the testament of 1451). In the absence of any works securely attributed to Galasso, his influence on Cosmè cannot be estimated; but there are indications of other influences that may have contributed to the formation of his style. During his entire career Tura followed the approach of the school of Francesco Squarcione (see XII, col. 57). If, as seems probable, Cosmè went to Padua in 1453, he had ample opportunity to become acquainted with the principal masters of this

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

style in the Ovetari Chapel. Of these masters, Nicolò Pizzolo and Ansuino da Forlì seem closest to his art. About ten years later Tura worked in Ferrara with an older Squarcionesque master, Michele Pannonio (b. before 1400). Together they produced a cycle of paintings, of which Pannonio contributed the signed *Ceres* in Budapest (Mus. of Fine Arts), Tura the allegorical figure (Venus; PL. 201) in London. Since Tura had already been working in the Squarcionesque style, the contact with Pannonio merely strengthened this stylistic tendency.

Tura's testament of 1471 suggests that he had a close and lasting relationship with Venice. Could he have become familiar with the studio of Antonio Vivarini (q.v.), who was born about 1415? It is a fact that throughout his life Tura's style maintained a striking similarity to that of Antonio's younger brother, Bartolomeo. However that may be, Tura remained true from first to last to Squarcionesque mannerism to the extent of being considered its greatest representative. This mannerism — half late Gothic, half Renaissance — reached its most complete and most extreme expression in Tura's work, leading then directly to 16th-century mannerism. In his interpretation of this style Tura was more elegant, more skillful, more moving and expressive than the others who sought to follow the same path, including his contemporary and compatriot Marco Zoppo (b. 1433 in Cento), who painted in the same style but lacked Tura's imaginativeness and power of expression.

Other elements also entered into the development of Tura's style. Among these were the influence of artists from the northern countries (at that time numerous in Ferrara, the most prominent among them being Rogier van der Weyden, active 1449–50 in that city) and that of the Italian transition masters (Gentile da Fabriano, Pisanello, Jacopo Bellini, qq.v.). At the request of Duke Borso, Tura went to Brescia to study Gentile's paintings in a chapel there as inspiration for his own paintings for the chapel of Belriguardo Castle. Tura's *Portrait of a Young Prince of Este*, the earliest extant example of the artist's works, is clearly related to a contemporaneous series of Este portraits painted about 1450 by Pisanello (Louvre; Bergamo, Acc. Carrara), Rogier van der Weyden (Met. Mus.), and Giovanni da Oriolo (London, Nat. Gall.); portraits (now lost) by Mantegna and Jacopo Bellini also formed part of this series. Rogier van der Weyden's expressive Gothic style, Gentile's courtly style, and the naturalism of Pisanello and Jacopo Bellini undoubtedly all contributed to Tura's stylistic formation. A painting such as the *Charity* in Milan suggests that Tura was working with a master whose style was similar to Rogier's, while the *Madonna with Sleeping Child* in Venice seems to have been inspired directly by the Flemish master. The close relationship with the Ferrarese miniaturists, some of whom were of northern origin, would have offered an obvious channel for the reciprocal influence between Tura and the northern masters. It was not without reason that 18th-century Italian critics, for example C. Barotti (*Pitture e Scolture . . .*, Ferrara, 1770), called Tura the Dürer of Italy. That Mantegna's perspective constructions influenced Tura (although he was never a true perspectivist) is evident in his polyptychs (Roverella Altarpiece, altarpiece for the Church of S. Giacomo), whose conception shows borrowings from such works of Mantegna as the S. Zeno Altarpiece and the St. Luke Altarpiece in Milan (Brera). Further evidence is seen in Tura's work of about 1470: the "angular" style of his draperies of that period can be explained only by Mantegna's examples.

An attempt to reconstruct the development of Tura's style, in view of the broad similarity of his extant works, is extremely difficult and is possible only on a hypothetical basis. The dated or datable works are all from 1468–84, that is, 15 years out of a creative period that covers nearly 50 years. The works from this 15-year period nonetheless show a recognizable development, from which inferences can be drawn regarding the periods before 1468 and beyond 1484. Since there is evidence that Tura did very little work after 1484–85 (the latter date may be considered the effective end of his creative period), the greatest difficulties arise in the study of his earlier period. Most of Tura's extant works can be arranged in a convincing order of stylistic development that appears natural and consistent. But there remain other works whose fundamental characteristics and style identify them incontrovertibly as Tura's but which show slight nuances of difference from the usual lines of his work and lack unitary character. These works may be considered an expression of the artist's search for a personal style as yet not definitively formed. If it is considered further that certain traits of a somewhat older fashion appear in these works, there is justification for accepting them as early works of the artist, attributable to the decade before Belfiore — that is, to the years before Tura was officially recognized as the chief Ferrarese master, after which he would naturally have ceased to be subject to the influences of others and would instead have made his own influence felt.

The works of the early period (ca. 1450–60) tie in directly with the datable works of 1468–84 and form with them a smoothly progressing homogeneous series. The *Portrait of a Young Prince of Este* in New York is judged by its stylistic manner to be comparatively the most outdated, most self-conscious, and — with all its choice beauty — the most conventional of Tura's works, even though the Squarcionesque traits are already revealed in the accentuated elegance of manner and the fastidious expression. This tendency shows even more clearly in the two small paintings of St. John the Baptist and St. Peter in Philadelphia, which are strikingly reminiscent of Nicolò Pizzolo and which — strongly drawn, solidly modeled, and somewhat drily painted — unmistakably show Tura's well-known characteristic style. Two other small pictures that covertly follow the same Squarcionesque direction are the *Madonna with Zodiac Mandorla* in Rome and the newly discovered *St. George on Horseback* in the Asquith Collection, as well as two exceptionally fine and elegant pen drawings: the Mercury (Bayonne) and the Christ(?) at the Pillar formerly in Berlin.

All these tendencies culminate in the *Madonna with Sleeping Child* in Venice, which clearly shows the influence of the Flemish masters. To this stylistic period belong the *Charity* in the Museo Poldi Pezzoli — probably begun by a more Flemish-oriented artist and finished by Tura — and the allegorical figure of a Virtue (Hope?), also finished by Tura, in the Collezione Strozzi, Florence. These partial works of Tura as well as the drawing (unfortunately altered) of Vesta in the Albertina lead over into a new, independent, and completely consolidated period of Tura's style.

What may be called the early mature period in the development of Tura's style extends from about 1460 to 1471/1472. The works of this period that clearly precede the organ door for the Cathedral of Ferrara (before 1468/1469) — the altarpiece for S. Maria della Consolazione (Ferrara), the *Portrait of a Man* in Washington, the *Venus* in London, and the drawing of Charity in Berlin — show an unusually strong, expressive flexibility of interpretation that manifests itself especially in the folds of the garments. While the gestures, the expressions, and often also the posture and attitude of the figures have a rather fixed rigidity, an almost puppetlike stiffness, the garments, with their profuse, frothy, often almost turbulent folds, seem to be whipped by a tempest — a contrast that generates a powerful tension. Mood and expression have something demoniacal; the characters are of a highly expressive ugliness. The colors, dark but glowing, are brought into vibrant movement by a stormy glitter as well as by a fluid, almost sketchy characteristic brushstroke, especially in the predella paintings (now in Rome, Milan, and Venice) of the above-mentioned altarpiece. Tura had found his own style, a personal interpretation of the Squarcionesque manner, of which he displayed a sovereign mastery, cultivating it as an independent and self-sufficient means of expression, not merely for its pictorial value.

All these tendencies came together in the *St. George Slaying the Dragon* on the outer sides of the organ door, a work whose internal and external dynamics burst through the limits of the merely pictorial with eruptive vigor. The pictorial world here is not a closed realm; it exists as a transitional stage, a passage before and behind which the concrete reality moves on as though organically coherent with it. The powerful movement is encompassed not through compositional (that is, static) means but through its dynamics, through its sweeping, pulsing rhythm.

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

Although the *Annunciation* on the inner sides of the organ door is, in keeping with the theme, imbued with peace and tranquillity, Tura pursued this dynamic line further in a series of works chronologically closely associated with the organ door: the tondos of the St. Maurelius Altarpiece from S. Giorgio fuori le Mura and the small *Madonna in the Garden* in Washington. In the tondos Tura sought to bring the maximum of motion into harmony with the composition, tautening his brushstrokes and drawing together the principal lines (especially in the folds of the garments) in tension-laden straight horizontals and verticals. In the serene composition of the *Madonna in the Garden*, this principle leads to an almost wooden rigidity, which, however, instead of being "archaic," gives a feeling of antiquity and is quite charmingly decorative. This conscious leaning toward the decorative approach is readily explainable by Tura's involvement during that period with the commissions for large cyclic wall decorations: the library of the Pico Castle (1465–67), the Cappella Sacrati (1467–68), Palazzo Schifanoia (1469–71), and the chapel of Belriguardo (1469–72).

The "angular" style with the vertical and horizontal concentration of lines and the right-angled composition of figures, evident in the St. Maurelius Altarpiece and in the *Madonna in the Garden*, finds its most extreme and most pregnant expression in the Hall of the Months in the Palazzo Schifanoia, where it demonstrates its highly decorative value. The astronomical universe of paintings demanded by the program at Schifanoia gave Tura's genius the fullest opportunity for display. The gloomy atmosphere of the *September* expresses Tura's profound sensitivity as completely as does the allegorical figure in London or the *St. George Slaying the Dragon*.

A similar spirit pervades the works dating from about 1471/1472 to 1483, although Tura's brushwork shows slight but significant changes. The highlight of this later period of Tura's mature style is the Roverella Altarpiece from the Church of S. Giorgio, painted in 1474. The transition from the Schifanoia style to that of the great Roverella Altarpiece is marked by a series of smaller paintings such as the *St. John at Patmos* in Genoa, the *Crucifixion* in Cambridge, the *Pietà* in Venice, and the tondos in Cambridge, Boston, and New York, as well as by several drawings and the *Lamentation* tapestries in Cologne and Cleveland.

In this period Tura sought to replace his tempestuous, demoniacal movement with a tranquil, composed majesty penetrating his splendor and brilliance. The sharp, angular brushstrokes gave way to a flowing, gliding, wavelike line. The broad shapes became smooth, calm, and solidly worked out, and the folds of the robes are draped over them almost like garlands, with the effect of heavy undulations. Although the masculine saints of the Roverella Altarpiece and the nude Hercules in the drawing in Rotterdam show a Michelangelesque fullness of form, wherever the theme demands it Tura calls on his powerfully expressive pathos for support. In Passion scenes such as the *Lamentation* tapestries or the *Pietà* in Venice he again based his great strength of expression on the ugly and the deformed. The *Lamentation* of the lunette on the Roverella Altarpiece is completely different: full of gesture and movement, a scene from a religious drama — perhaps with a hint of the influence of the terra-cotta Depositions of Niccolò da Bari (dell'Arca) and Guido Mazzoni. Although the unusually homogeneous and symmetrical composition of the Roverella Altarpiece is somewhat conventional, still, in this period, in which Tura's art had achieved a maturity no longer troubled by difficulties and minor problems, he did not abandon his pronounced individualism and his propensity for the unusual and the extraordinary in expression. Characteristic of this approach is the small *St. John at Patmos*, an expression of that strange "pious irony" which is typical of his spiritual inclination. His coloring in this period, especially in the central panel of the Roverella Altarpiece, is luminous, almost gay; the mode of painting broad; the brushwork occasionally open, here and there with a plastic quality.

The terra-cotta *Pietà* (formerly Florence, Coll. Ventura), with its brilliantly dynamic composition, seems to be more of a sketch than a completely developed sculpture. (It is, the author believes, the only sculptured piece extant that can definitely be ascribed to Tura.)

Related to the large *St. Anthony* in Modena, of Tura's final period (ca. 1484–85), are eight smaller panels of single figures of saints, which are similar in form and format and which together with the *Pietà* in Vienna belonged to three similar polyptychs whose existence is documented by 18th-century witnesses. Also representative of this stylistic period are a drawing in the Uffizi (Apostle or Evangelist) and the woodcut of Alfraganus and Eremita, which was published in 1493 and is the modest, last known example of Tura's artistic activity. The transition from the Roverella Altarpiece to the *St. Anthony* is represented by the two fragments from the altarpiece for the Certosa (London and Milan). Tura's late period, in which the ultimate development of style as an independent tool of art reached its highest expression, can be considered "ornamental." Nature and interpretation are crystallized in a richly significant ornament abounding in nuances and full of tension. Here the characteristic example is the *St. James* in Caen, in which the folds of the robes are drawn together into a spiraling ornamentation that unmistakably displays the typical stylized form of a conch. The painting technique in this period is often of a glassy smoothness (*Madonna with Blessing Child* in Bergamo), yet from time to time very free, almost sketchy (panels from the Church of S. Luca in Borgo, in Berlin). An expression of consuming melancholy or esoteric rapture characterizes almost all the works of Tura's late period.

TURFAN. Although the region of Turfan, rich in monumental centers and vast monastic complexes, is an integral part of Central Asia (see ASIA, CENTRAL, cols. 834–837), it nevertheless presents some aspects that noticeably characterize it in the artistic development, fundamentally unitary, of that area. Several religious currents coexisted here, from Buddhism (q.v.) to Manichaeanism (see MANICHAEAN ART) and Nestorianism (see NESTORIAN ART), from which derive considerably different, though related, iconographies and styles. The Islamization of the region, which took place without the harsh intransigence found elsewhere, did not exclude the survival and prolongation of heterodox artistic activities side by side with Islamic ones and later favored the preservation of the monuments and works related to other religions. The stylistic development, conditioned both by the nearness of the Chinese world and by the contribution of the Turkic peoples (see TURKIC ART), who made this region their principal cultural center at the time of the Uigurs, is also differentiated from the remaining territory of Central Asia, although it remained bound to the trends that followed and interpenetrated one another in all of Central Asia. Direct and indirect relations with Sogdiana (q.v.) and with Iran

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

(see SASSANIAN ART) increased the variety of the local production, constituting, in a certain sense, a historicoartistic problem.

SUMMARY. Historical background (col. 345): *Stylistic development.* Sites (col. 348): *The monastic cities*; *The royal cities.*

HISTORICAL BACKGROUND. The oasis of Turfan, whose modern name dates from relatively recent times (ca. 15th cent.), was originally part of a region known to the Chinese, from about the beginning of the Christian Era, as Ku-chih, or Chü-shih; it constituted a small kingdom with two royal residences situated north and south of the easternmost part of the T'ien-shan (Celestial Mountains), known, from west to east, as Bogdo Ula and Edemek-daban. The kingdom was conquered in 60 B.C. by General Cheng Ki and was partitioned into eight principalities: the two in the south made up Inner Ku-chih and the six remaining ones formed Outer Ku-chih.

In the course of the following centuries the Ku-chih territory was alternately unified and divided several times and was given various names, according to whether the areas belonged to China or dynasties under its dominion or to the nomadic peoples of Central Asia. The name of Kao-ch'ang appeared as early as the Han period, when Kao-ch'ang-pi designated a Chinese military colony that already existed by 59 B.C. and was reorganized in 48 B.C. In A.D. 327 Kao-ch'ang became the seat of a military garrison; and in the middle of the 5th century, when Inner Ku-chih became independent, Kao-ch'ang became the region's capital. The K'iu dynasty transferred the capital (ca. 497) to Yār-khoto, where it remained after the conquest by the T'ang dynasty in 640. At that time Yār-khoto became also the seat of Ngan-si Tu-hu ("The Protectorate General for the Pacification of the West") and of the civil administration of Si-chou ("The District of the West"); shortly afterward these administrations were transferred, most likely in 651 or 567, to "the former country of Kao-ch'ang," probably to Khocho, near present-day Kara-khōja. In 658 Ngan-si Tu-hu was moved to Kucha, while the civil administration of Si-chou remained at Khocho, which was conquered (ca. 790) by the Tibetans. After the dissolution of the Uigur empire (840–43) a Uigur kingdom was established in the region, with a southern capital at Khocho and a northern one at Besh-balik (Pei-t'ing), northeast of Urumchi. Being a vassal state of the empire of the Kara-khītai in the 12th century, the Uigur kingdom submitted to Genghis Khan (see MONGOLIAN ART). Toward 1400 Khocho was replaced by Turfan, the capital of the Uigur ruler then being in Idikut-shahri.

At the beginning of our era the population of the region of Turfan spoke the same language as that of Karashahr (Qara Shahr). With the growth of the Chinese population, the Chinese language tended to play an increasingly important role. However, other languages were spoken, such as Kuchan, or Kuchean, and even the Tumshuk dialect, which was employed in a number of documents found in Murtuk. From the 5th to the 7th century the Turfan area was under the rule of a house of Altaic origin, which suggests the presence of other linguistic influences coming from the region of the steppe (see STEPPE CULTURES); however, the sovereigns of this dynasty were eventually Sinicized. Later evidence points to a real Turkic influence, shown by documents of the end of the 6th century, during the T'u-chüeh dynasty. With the Chinese conquest in 640, the Chinese language and civilization were solidly established; the Tibetan occupation left few traces.

Buddhism had penetrated at an early date, perhaps in the 4th or 5th century. With the establishment of Uigur rule in 843, the influence of this people grew so strong that in the second half of the 9th century the Uigur language dominated; at the same time Tantric Buddhism, introduced partly by the Tibetans, throve, and other religious communities came into existence — Nestorian and Manichaean, traces of which have been found in literature and art (IX, PLS. 281, 282, 284, 287),

Principal centers in the Turfan area. *Key*: (1) Ruins; (2) ancient settlements; (3) fortified sites; (4) clay-brick towers; (5) Buddhist rock-cut sanctuaries; (6) present-day villages.

and possibly Mazdean. Islam was also to penetrate the region and achieve a dominant position after the waning of Uigur power. Under Mongol rule Buddhism and Nestorianism persisted, but during the 15th century, when Khocho and Idikut-shahri lost their importance and when the Uigurs were supplanted by other Turkic peoples, Islam spread and caused their almost total disappearance. During this period Buddhism and Nestorianism were reduced to mere surviving remnants, although the diplomatic mission of Shah Rukh referred, in 1420, to the existence of numerous unbelievers who had "large houses with idols." With the disappearance, or at any rate the almost complete expulsion, of Buddhism, art ceased to be produced in the region of Turfan, as it had earlier in the towns of western Serindia.

Stylistic development. If the purely Chinese pieces are excluded, the sculpture that has survived in the different sites of the Turfan region and in particular at Khocho shows a clear relationship with the numerous pieces found farther west in the areas of Karashahr, Kucha, and even Tumshuk. As a matter of fact, the heads of devatas (I, PL. 476) from Temples A and B at Khocho are very similar to others brought to light at Tokuz-saray in the latest structures, both in the facial expressions and in the hair styles. Stein found sculpture fragments at Hasa-shahri and Yār-khoto and at other sites (Sasik-bulak, Murtuk, etc.) in which successive styles are found — from pieces whose execution shows clear influences relating them to trends initially coming from Gandhara (q.v.) to others whose Tantric and Chinese influences indicate the late period of their execution. In fact, in addition to these fragments which show such disparate influences, there are traces of a regional style that underwent certain transformations after the arrival of the Uigurs in the Turfan region; this style takes on the aspect of a composite art varying according to sites and periods.

Painting is much more abundantly represented in Turfan, as is indicated in the description of the sites below. "Western" (i.e., Indian and Iranian) influences appeared there according to the religious tendencies of the period and mingled with those which came from Tibet (see TIBET; TIBETAN ART) and above all from China, certainly through Tun-huang (q.v.); these influences likewise vary according to the periods and the sites. The paintings of Murtuk and Toyuk show obvious "western" influences: for example, at Toyuk the frieze with boars' heads corresponds to a similar motif of Sassanian inspiration (see SASSANIAN ART) found at Bamian. On the other hand, at Bezeklik Sino-Tantric influences, characterized by the exacerbation of the features and of the musculature, predominated (PLS. 212, 213; I, PLS. 485, 488, 489). In other sites, such as Senghim-aghiz, are found combinations of Chinese and "western" tendencies. The paintings from Khocho often show Indian and Iranian influences — chiaroscuro effects and intensification of certain features to lend relief — which may have resulted from the presence of Manichaeanism and Nestorianism there (PL. 211; I, PL. 486; IX, PLS. 283, 285; X, PLS. 308, 309).

Painting at Turfan presents several phases during which certain influences related to the dominant political situation were prevalent. The first phase, marked by "western" influences that came to Turfan through the cities of the Tarim Basin, extended up to the Chinese conquest and occupation in the T'ang period (7th–8th cent.). The duration of the second phase, during which Chinese influences appeared, has not been clearly determined, but it seems to have lasted until 843, when the Uigurs settled in the region of Turfan (PLS. 209, 215). There followed a "western" reaction so great that the Uigurs remained adepts of Manichaeanism; this third phase seems to have been relatively short, extending perhaps to the end of the 9th century (PL. 210), but it may have already begun before the Uigur occupation. Lastly, during the fourth phase, from about the 10th century to the 11th and perhaps later, Chinese and Tantric influences became predominant (PL. 214); during this period, depending on the geographic location of the different sites, either the usual Uigur style or the Tantric style that can be described as Lamaic is evident in the art of Turfan. This fourth period witnessed the beginning of a decline that was to last up to the Moslem domination in the 15th century, when sculpture and painting virtually disappeared.

Architecture was the only art form to survive after the 15th century, but before that period it gave rise to the structures preserved at Khocho and Yār-khoto, in which are found all the tendencies, connected with the nature of the materials utilized, that met at an early period in the Tarim Basin and in which forms coming from Iran and India became established: certain structures, such as the stupas of Yār-khoto and Khocho, seem to have reflected late influences that came from India through Tibet or from Tibet itself.

SITES. The Turfan region comprises a complex ensemble of cities of various dates extending over at least a thousand years. It includes the ruins of the former capitals of the territory known as Ku-chih during the Middle Ages: Yār-khoto, Idikut-shahri ("The City of the Idikut"), and Khocho, built over the dead city of Kao-ch'ang, which flourished during the T'ang dynasty. The cemeteries of Astana and Kosh-gumbaz (Qosh-gumbaz), almost entirely Chinese, were part of Kao-ch'ang.

In addition to these earlier complexes, there are a number of sites with remains of Buddhist installations. A few miles northeast of Kara-khōja is Senghim-aghiz, with monasteries and sanctuaries constructed in brick or cut out of the rock. Nearby is Bezeklik, and farther north are the sites of Murtuk and Chikkan-köl (Čiqqan-köl). East of Kara-khōja are the ruins of Toyuk, with the remains of two large monasteries. In the midst of the desert south of Kara-khōja are the ruins of Hasa-shahri. North of modern Turfan is the site of Bulayik, where a great many manuscripts have been found.

There are also the ruins of Sirkip-tura, southwest of Kara-khōja; the poorly preserved ruins of Lamjin, east of Kara-khōja; and finally, the ruins of Tallik-bulak and Sasik-bulak, north of the present-day town of Turfan, which were studied by Russian archaeologists in 1909–10.

Among the sites in the region of Turfan, it is necessary to distinguish those of the ancient monastic establishments, by far the richest in artistic manifestations, and those representing the ancient cities which served as capitals for the sovereigns of the region and which also included sanctuaries. These monastic establishments and sanctuaries have been the principal objects of the research done at Turfan.

The monastic cities. Senghim-aghiz, like the other sites, offers several particularly interesting monasteries and brick or rock-cut sanctuaries on the west side of the ravine (I, PL. 490); on the height of the opposite bank are stupas, some of which rise on the extreme edge dominating the course of the water. It may be inferred, from the discovery of numerous documents, that these monuments, some of which are fortified, were built between the 8th century and the 11th. Monasteries 7 and 9, from the description by S. Oldenburg (1914), form a large, almost square quadrangle; they are furnished at the corners with constructions which originally may have been part of the encircling wall but which underwent transformations to adapt them to new needs. These monasteries comprise a principal sanctuary with a cella and an ambulatory opening onto a vast court facing the central entrance; on either side rose symmetrical buildings contiguous to the enclosure wall. This plan is related to that of the monasteries at Gandhara (q.v.); the sanctuary of Tokuz-saray in Tumshuk shows how this type of construction reached the Turfan region. In this monastery and in several monuments the remains of rich painted decoration were discovered.

Bezeklik and its satellite, Murtuk, together with the region of Kucha (q.v.), make up the largest religious complex of Serindia. Bezeklik, established in a gorge of the Kizil Tagh, south of the village of Murtuk, includes both architectural structures and rock-cut sanctuaries. The rock-cut sanctuaries, some of which were given a constructed part in order to provide a façade, are generally isolated, but some of them form complexes, particularly a large monastery with residence rooms, cells, and assembly rooms. Among the architectural structures are found some square cellas with domed roofs, such as the

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

small Sanctuaries 3 and 4. Most of the other rock-cut sanctuaries have barrel vaulting; only Temples 1 and 8 are provided with ambulatories.

The sanctuaries were divided by A. Grünwedel (1906) into three groups; this division underwent some modifications after its study by Joseph Hackin (1931). The oldest group comprises the painted decoration that has survived in the transverse corridor of Cave 8, in the cave disposed behind Foundation 9, and in Temple 3 and Caves 27 and 29; all these paintings are evidence of an early Buddhist occupation and may be considered as T'ang paintings of the 7th and 8th centuries. The second group, dating from the 9th century and a little later, includes abundant foundations that have preserved paintings of the usual Uigur style. The third group, whose decoration dates from the 9th to the 11th century and perhaps a little later, includes a small number of sanctuaries (nos. 11, 28, 30, 31, 32, and 33); the paintings, which express a pronounced Tantric influence and may be considered of Lamaic origin (PL. 214), show how strong the Chinese influence was in the region of Turfan, but with some "western" influences that arrived there through Kucha and probably with some Tibetan influences effected by Tun-huang (q.v.), which served as a link with China and Tibet from the point of view of Tantrism.

About 3 miles from Bezeklik, at the foot of the hills that border the valley of Murtuk at the south and southwest, a group of five sanctuaries was cut into the rock; facing these sanctuaries rise the ruins of several buildings constructed in brick. The painted decoration of the first sanctuary has completely disappeared and the second has preserved only vestiges of paintings, for example, a circular medallion with stylized lotus petals around the edges. Sanctuary 3, the most important, has barrel vaults and an ambulatory; it has preserved part of its painted decoration, which, unlike that of Bezeklik, shows that the "western" influences had resisted the pressure of those of China.

Six miles from Murtuk, other ancient sanctuaries were discovered at Chikkan-köl (Čiqqan-köl), a place situated between Bezeklik and the upper part of the gorge of Senghim, west of a series of heights. The complex at Chikkan-köl consists of several rock-cut sanctuaries in a gorge near a large lake and Buddhist structures (in ruins) located on the edges of the lake and on an island. The finds that were made in the buildings had suffered from the humidity; those in the rock-cut sanctuaries consisted essentially of wall paintings, which, although very damaged, show that they were executed in about the 7th century and painted in the style of those at Toyuk, thus constituting one of the most ancient examples of painting in the Turfan region. Examination of the rock-cut sanctuaries led to the discovery of a coffered, or lantern, ceiling cut into the rock as at Kizil and painted as at Bamian and in Kashmir.

The site of Toyuk (PL. 216) is one of the large complexes of the Turfan region. Among the constructions on either side of the gorge, a large monastery (designated by Grünwedel by the name of Great Temple-Terrace L) and a series of rock-cut sanctuaries (the most important of which are called Klementz Foundation 6, Cave of Mucilinda, and Cave of the Ascetics) constitute the most remarkable elements. The Great Temple, constructed breadthwise because of its position against the mountain, is a sanctuary enclosing a stupa with symmetrical cells of the same dimensions on each side; two constructions, probably cellas, stood in front of the sanctuary. The Klementz Foundation 6 consists of a rock-cut sanctuary with an ambulatory around a rock mass with an altar on the front. The Cave of Mucilinda has a vestibule that gives access to a cella provided with an ambulatory. Lastly, the Cave of the Ascetics is a complex ensemble including a vast vestibule giving access to three cellas: one facing the entrance; a second to the left of the entrance provided with an ambulatory; and a third on the right, with a smaller cella at the end and two small symmetrical cellas on either side. A fourth sanctuary, Cave 38 (D. von Klementz, 1899), whose remaining decoration is particularly important, should be mentioned. In addition, traces of stucco images have been discovered by Aurel Stein, including some fragments of reliefs representing small heads, death's-heads, remains of monsters, etc.

In the same area east of Kara-khōja, two other sites of lesser importance contain ruins of Buddhist establishments, northeast of the Lukchun complex. The first, situated in the area south of the Kizil Tagh and known by the name of Lamjin, is located in the gorge of the same name and consists of poorly preserved ruins. The finds here include scenes of the life of the Buddha, cut in a stone that undoubtedly broke off from the rock wall; originally they were probably surmounted by a wooden protecting roof, as is evidenced by the holes made in the stone above the scenes. The second site is located at the foot of the Kizil Tagh, at Sirkip-tura, and consists of a tower on a square plan, with recessed stories (six stories remain) that have exterior niches formed by horseshoe-shaped arcading in the upper part; these niches contained images, probably painted red, of the Buddha seated in meditation. This tower, certainly a stupa, shows great similarity to that of Tai-san, at Astana, and that known as At-hayashi, at Idikut-shahri.

About 6 miles south of Kara-khōja, two monastic establishments, Chong-hasar-shahri and Kichik-hasar-shahri, were discovered in the sand by Von Le Coq; only the second was examined. It consists of an Indian-type stupa and constructions covered with an Iranian-type dome, all surrounded by fragments of an enclosure wall. Apparently no remains of decoration were discovered there.

Other sites containing ruined monuments of various origins are to be found more to the west, north of the present-day city of Turfan, not far from the ancient capital of Yār-khoto; they constitute the counterpart of the complex of similar monuments grouped around Khocho and Idikut-shahri. Several groups of monuments were discovered in the area of Chui-pang: one at Bulayik, at the base of the foothills of Bogdo Ula, and in the same area Tallik-bulak and Sasik-bulak, to which must be added Kurutka. The constructions at Bulayik, today in an extremely ruined state, must have been part of a Christian establishment, perhaps a monastery, since a large number of manuscripts of Christian origin were found there. The other three sites are of Buddhist origin and are better preserved. Tallik-bulak includes architectural constructions and rock-cut sanctuaries; the latter are located in a gorge descending from Bogdo Ula. The most important cave is the one called the Cave of the 84 Sages, whose painted decoration has been studied by Grünwedel and Oldenburg; the cave included a pillar left in the process of cutting (which, opposite the entrance, serves as a stupa) and an ambulatory. The walls of the cave were decorated on the upper part with scenes depicting Siddhas (Sages) and a certain number of Tantric representations of clearly Tibetan origin. Sasik-bulak offers a series of rock-cut sanctuaries whose painted decoration is less well preserved; certain paintings there reflect the influence of Kizil and, consequently, of Bamian, although others show clear Lamaic influence (Cave 4) or Chinese influence (Cave 5). Lastly, the site of Kurutka, also situated in a gorge, is remarkable for a domed construction.

The royal cities. Of the two ancient royal cities that were the seats of the southern principality of the region of Turfan, Yār-khoto is the older. Situated west of the present-day city of Turfan, the very damaged ruins still offer grandiose remains; streets can be distinguished, and the purpose of some of its more resistant structures can still be determined. According to the plan drawn up under the direction of Oldenburg, the city describes a square enclosure, two corners of which are oriented in a north–south direction. Inside the encircling wall are four districts arranged in squares and divided by four streets that intersect symmetrically, giving 25 blocks of constructions regularly arranged. The center of the city is occupied by a stupa raised on a square platform with a stairway facing the avenue running northwest and the entrance to the city. The stupa consists of a high central tower around which are arranged four towers on the angles of the square. There is no record of painted decoration having been found in this monument or in the other constructions of the city, which were probably ancient palaces, small monasteries, or sanctuaries; one of the sanctuaries contains a building with niches that is similar to

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

the stupas of Sirkip and Astana. Some Buddhist banners were found. Not far from the city, in a hillside, are several rock-cut sanctuaries; although no precise description has been given of any painted decoration here, Aurel Stein discovered some fragments of stucco reliefs and of wall paintings.

Khocho, the ancient capital of the east, known at different times as Kao-ch'ang, Idikut-shahri, and Kara-khōja (although at present Khocho and Idikut-shahri are used for separate sites and Kara-khōja is the modern village; see FIG. 345), offers a large complex of monuments in ruins surrounded by a fortified enclosure of almost square plan with several fortified gates. Its street plan is difficult to determine; its many structures, which German archaeologists have designated by letters, include buildings of every kind — temples, palaces, and other civil buildings.

In addition to constructions of Manichaean or Christian origin, a fairly large number of Buddhist sanctuaries and monasteries are of considerable interest as much for their arrangement and their architectural layout as for the decoration still to be found in them.

The sanctuaries of the simplest type are composed of an enclosure provided with a sort of antechamber and containing, as a rule, a stupa with an ambulatory. Among these may be cited Temple A, which is located in the northern part of the center of the city and whose walls in certain places are still over 16 ft. high. These walls form a long rectangle divided into two parts, one undoubtedly constituting a sort of antechamber that led into a large hall; in the interior of this hall the base of a stupa resting on a low platform was found. At each side of the base of the stupa are three pedestals that supported statues (undoubtedly representing the Buddha) seated on thrones with painted and partly gilded reliefs, fragments of which were found among the debris.

Temple C, constructed on a platform and surrounded by walls originally nearly 20 ft. high, belongs in the same category. The rectangular enclosure (approx. 98 by 59 ft.) opened toward the south and was preceded by a kind of antechamber about 26 ft. wide. The temple itself consists of a large hall containing a 26-ft. platform at the rear; on this platform are the remains of a base surrounded by a wall forming, with the back wall of the hall, an ambulatory on the four sides. Remains of painted and sculptured decoration were found at various points.

Other temples of a related type were found, such as Temple I and I′, which are located northeast of the central part of the city; the latter contained numerous traces of sculpture and mural painting. Temple W, almost in the center of the enclosure, is of the rectangular type and, constructed on a platform over 3 ft. high, contains a sort of pillar with pedestals on each side, on one of which was a statue. Temple V, located beside the northeast wall of the city, consisted of a cella opening onto a court and surrounded by a wall forming an ambulatory with a vault about 5½ ft. wide. The vault was decorated with paintings representing Buddhas in rows, while the walls were decorated with Buddhist scenes; a base, on which was the image of a recumbent Buddha, extended the whole width of the back wall of the cella. Temple X, situated south of the central part of the city, was square and contained a central pillar surrounded by an ambulatory; this pillar too was decorated with statues whose remains have been found.

All the sanctuaries of this type were of a relatively simple plan. Others, of a type apparently not to be found in other areas of Central Asia (see ASIA, CENTRAL), offer a much more complex architecture. Temple B, situated between Temples A and C, appears as an irregular platform that included a central terrace with other terraces at its four corners, the walls surrounding the central complex thus being roughly cross-shaped — a form perhaps recalling the central stupa of Yār-khoto. Temple P, in the northwestern part of the city, is particularly remarkable: similar in appearance to Temple B but with an extremely complicated development of the original plan, it is delimited by an almost square enclosure wall and comprises constructions grouped in four squares symmetrically arranged in relation to the four corners of a central square monument, of the same type as the stupa of Yār-khoto. The central monument is raised on a platform 52 ft. square and 14 ft. high, at the center of which is a tower 12 ft. square; at the four corners of this tower, certainly the highest, are four lower towers of the same square plan. The central platform is framed at each corner by a monumental complex of small towers arranged in a square, each of these four squares comprising 25 towers of the same type arranged in rows of five. The whole rested on a terrace (208 by 188 ft.) encircled by a low wall, so that the complex is visible from outside.

Temple Z, situated in the southeast corner of the city, comprised a long barrel-vaulted hall, behind which rose a high, storied tower. The hall, forming a rectangle, opened by a door on the middle of one of the long sides and was decorated, on the side facing the door, with five pedestals bearing enthroned Buddhas; on each side of the thrones were paintings representing flying devatas; the clouds constituting the background seem to have been drawn in the Chinese style. Facing these statues, on the walls at each side of the entrance, were painted Buddhas corresponding to those of the back wall. The east and west walls were decorated with paintings arranged in rows and representing the life of the Buddha, now more or less destroyed. Behind this hall arose the storied tower, a pyramidal structure with projections in the direction of the cardinal points from which small windows opened.

Temple Y, in the eastern part of the city, also offers an interesting plan; it preserves parts of a storied pyramidal structure with niches. The pyramid, on a quadrangular platform (about 82 by 65 ft.) whose south and west sides have been preserved, is formed of three superimposed terraces whose approximate dimensions are respectively 52 by 49 by 9 ft., 44 by 41 by 7 ft., and 36 by 33 by 5 ft. On the uppermost terrace are remains of a stupa, or another terrace, about 26 ft. square. Each terrace included a series of niches on each side: eight for the first, six for the other two stories, and one on each side of the uppermost part — in all, 84 niches. These niches contained images of the Buddha and painted decoration, especially ornamented aureoles in several colors. The access to the temple is at the north of the quadrangular platform. From a small platform (about 5 ft. high) a stairway led to the third terrace and undoubtedly ended at the stupa; lateral stairways permitted access from the main stairway to the first terrace, but no trace of a stairway of this kind remains on the second terrace. On the uppermost terrace an opening leads into a cave situated at a lower level.

Mention should also be made of the groups of monuments designated by the references α, β, and γ, which are noteworthy not only for their architecture but also for the remains of painted and sculptured decoration. Group α offers a complex ensemble of buildings, some of which had been constructed, or occupied during a certain period, by the Manichaeans, while others had been occupied by Buddhists. Group α, situated southwest of the city and enclosed by a double row of walls, seems to have had an approximately square plan; in the enclosure is the base of a stupa or of a pillar, behind which is a hall with a cella. South of these two structures is a corridor leading toward a stairway; the corridor separates the stupa and the hall from other buildings, two of which were undoubtedly a principal and a secondary entrance. Other structures, not clearly identifiable, are east of these entrances, while east of the cella rises a structure, probably another entry hall, with another hall north of it. The cella and the corridor, which formed an ambulatory, were decorated with wall paintings in which the Chinese influence is clear. Under the entrance nearest the cella were discovered fragments of statues, perhaps representations of lokapalas.

Group β, situated not far from α but more to the west, occupies a rectangle over 650 ft. long and 325 ft. wide; it is oriented toward the east and has preserved parts of its surrounding walls, which seem originally to have had towers at the corners (the two on the south side are preserved; those on the north were undoubtedly replaced by other buildings). Within the walls are several complexes of buildings. The complex at the back of the enclosure consists of narrow barrel-vaulted rooms on three sides, most of them divided in two and opening onto an interior court containing several structures; these in-

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

clude an enormous pillar (still about 45 ft. high in the best-preserved part) surrounded by a crenelated wall (about 39 ft. high) that forms an ambulatory reached through a vast entry hall (in ruins), preceded by a sort of terrace. In front of this complex are two square, domed halls and some cells. The complex of buildings (Complex E) that constituted the north side of the façade includes a central hall with an ambulatory and other rooms whose use has not been clearly ascertained. Traces of painted decoration remained in the complexes of Group β, including aureoles in the niches of the large pillar (which had enclosed statues of the Buddha) and the decoration of a plinth course in one of the halls. Other paintings, badly damaged but extremely beautiful, were also found, especially on the lower parts of the walls of the ambulatory of Complex E.

Group γ, located at about the same distance from the west enclosure wall but at the height of the center of the city, forms a vast rectangle including a main court that opens onto a second, slightly smaller one. Toward the back of this second court, reached through a door of which the centering remains, rises a high pillar on a square base. Numerous sculptured fragments of Buddhas or bodhisattvas were found in the debris, and the base bore paintings representing rows of delicately executed small Buddhas.

To this long list must be added one last monument located in the enclosure of Khocho: Ruin E, situated almost in the center of the city, which could have been the palace of the Uigur rulers. This ruin, whose plan cannot be accurately determined, is formed of a series of structures within an enclosure, including a double tower, still fairly well preserved and surrounded by debris, and an ancient gateway, with the side walls decorated with paintings.

Some other important structures should also be noted — among them several temples — situated on the opposite bank of the river, outside the enclosure of Khocho. Two of the temples are especially interesting, Temples Б and Ц, whose Russian designation has been preserved by Grünwedel. Not far from them are two groups of stupas: the so-called "Small Stupa Group" and "Large Stupa Group," which may have been tombs (*gumbaz*).

TURKEY. The territory of present-day Turkey, a republic since 1923, comprises the central part of the old Ottoman empire (Anatolia), a small area bordering northern Syria around the Gulf of İskenderun (Alexandretta), the upper reaches of Mesopotamia, and the mountainous region of Armenia. It is bordered on the south by Syria and Iraq and on the east by Iran and the Armenian and Georgian Soviet Socialist Republics; it also includes a narrow strip of land in eastern Thrace, bordering on Bulgaria and Greece, which represents the remains of the European portion of the Ottoman Empire and, practically speaking, forms the territorial limits of the metropolis of Istanbul; the maritime border with Greece runs along the Aegean coast of Anatolia, east of the large islands of Lesbos, Chios, Samos, Kos, and Rhodes.

Geographically, therefore, Turkey is more or less synonymous with Asia Minor, whose historical and cultural past it has inherited and developed. The territory is heterogeneous, divided into an inland plateau and coastal areas, which, being inhabited by people of distinct traditions and occupations (the inland peasants and shepherds, the coastal fishermen and vine cultivators), have always differed in character. This dual aspect, springing from differences in environment and climate, is the key to the age-old forms of Anatolian civilization and art; the predominance of one cultural area over another varied from period to period, according to circumstances. So it was that in the 2nd millennium B.C., during the Hittite period, a continental empire developed that was markedly Anatolian as compared with the coastal populations; from the 11th century on, there was a partial immigration of the coastal populations inland, with intense pressure on the part of the Greek colonies strewn along the coasts of Asia Minor; after the Persian interlude, Greeks, Romans, and Byzantines were for a very long time in the ascendancy; with the establishment of the Seljuk sultanates in the 13th century, Asiatic, Turkish, and Anatolian continental influences once again prevailed, subsequently blended in the gigantic melting-pot of the Ottoman Empire with its Mediterranean and European ideas and influences. The modern Republic of Turkey has reasserted and fortified the spirit of its ancient Anatolian traditions.

SUMMARY. Historical-artistic survey (col. 354): *Prehistory, Pre-Hittite civilization, Hittites; Phrygians, Lydians, Ionians; Hellenistic age; Roman age; Late Roman and Byzantine age; Seljuks; Ottomans; European influences and contemporary trends.* Monumental centers (col. 369): *Historical topography; Asian Turkey; European Turkey.*

HISTORICAL-ARTISTIC SURVEY. *Prehistory, Pre-Hittite civilization, Hittites.* The oldest traces of man in the Anatolian peninsula date from the Upper Paleolithic period. Recent discoveries have proven the existence in the region of the Antalya Gulf of a mesolithic culture with microliths and of a non-pottery and pottery sequence with cliff paintings (Beldibi and Kızılkaya). Perhaps here are to be found the antecedents of the neolithic culture on the plateau, the existence of which was, up to a few years ago, either excluded or questioned. At Hacılar and Çatal Hüyük evidences of thriving farming and hunting communities have come to light that testify not only to a transitional stage between a period which had no pottery to one in which earthenware was produced, but also to the existence of a religion centered around fertility ceremonials (IX, PL. 416; XI, PL. 297). Both private and public shrines have been uncovered in the residential areas. These contain geometric or naturalistic wall paintings (much restored) as well as a wide assortment of figurines of goddesses, mostly steatopygous, in various attitudes and sometimes depicted with wild animals (see PREHISTORY).

Chalcolithic pottery, dependent in type on the pottery of the preceding period, shows an elevated sense of decoration and form, a delight in geometric motifs, and analogies (at times out-and-out importations) that seem to relate the area of the Konya plains and the lakes of Pisidia to Cilicia, where neolithic culture of an Anatolian type merged with a vaster cultural community of Mesopotamian origin. Tell Ḥalāf culture, in fact, not only extended as far as Mersin and Tilkitepe on Lake Van, but penetrated deeply, though indirectly, into the highlands as well, probably giving rise to the vast culture of vividly decorated pottery that some authorities claim extended as far as northern Greece (Sesklo and Dimini). The evidences of fortified towns and of actual fortresses testify, moreover, to the belligerance and insecurity of the period. While the Chalcolithic period in the southern part of the highlands was in some way related to northern Mesopo-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

tamian cultures, to the west a certain unity is evident within the orbit of those regions centering upon the Mediterranean coast — a cultural area that also included the islands off the Anatolian mainland. Comparable to the earliest levels of Beycesultan are the stations along the Hellespont, such as Besiktepe and Kumtepe, which represent the antecedents of the first city of Troy (IX, FIG. 645). At the same time, although there is no specific evidence, there very likely flourished in the northern highlands villages, such as Büyük Güllücek and Yazir Hüyü, that show the effect of contact with the Cilician coast.

The artistic history of the early Bronze Age is more complicated. At first there was the Troad culture and the intermingling of the regions to the southwest after the destruction of Troy I, with subsequent migrations; and later, at the end of the early Bronze Age II, there was the movement from the north toward the southeast of what were presumably those Luwians, who, in historical times, were to play so important a role within the Hittite empire. But at the same time there existed a series of inland Anatolian villages which had for some time testified to the cultural level of the people; the discovery of the royal tombs of Alaca Hüyük has brought about a radical change in the traditional view of this having been a poor farming culture. These tombs, extremely rich in their fittings of gold and other metals, and particularly interesting for the statuettes of stags and bulls (probably sacred symbols) and for the so-called "standards" (I, PL. 517) have proved how little was actually known heretofore about the life enjoyed by the culturally more elevated classes of this period. Although these works are virtually unique in this period (but running parallel, also on a typological level, to the so-called "treasure of Priam" at Troy II, where an independent culture had evolved), the notion that they represent isolated exceptions is gradually giving way: the finds of Hasanoğlan, Horoztepe, and Mahmatlar, northeast of Alaca Hüyük, perhaps point to the path followed by this ruling caste (see MEDITERRANEAN PROTOHISTORY).

The destruction of the inhabited centers of Anatolia has been placed at about 2300; somewhat later the brilliantly painted ware called "Cappadocian" appeared. Just what the ethnic origins were of the princes so lavishly buried in the Alaca tombs, on the one hand, and of the inventors of this new style of pottery, on the other, is difficult to establish with any certainty. Some attempts have been made to associate the princes with the Hatti, and the importers of the new pottery with the Hittites, but these associations are largely hypothetical. It is to be noted, moreover, that "Cappadocian" pottery had completely disappeared by the time the first Hittite kingdom was established on the Anatolian plateau. The question of the arrival of the Indo-European Hittites is still to be solved on an archaeological level, but it may be presumed, with some probability of truth, that they arrived in small groups and then gradually forged themselves into a political entity. Their presence in Anatolia, together with the Hatti, has been established at the beginning of the 2nd millennium, not only from later reports, but from documents unearthed in Assyrian commercial colonies. Assyrian merchants operated in Anatolia from approximately 2000 to 1800 B.C., settling down into separate quarters near the more important cities (Kültepe, the mother colony; Alişar Hüyük; and Hattushash, mod. Boğazköy) and from there observing local customs and practices. The tablets from private archives have provided valuable evidence of trade with Assyria and, in particular, of local terminology. The introduction of the potter's wheel into the highlands dates from this period. The pottery, very refined in form (see, for example, the beaked pitcher type, VII, PL. 290), took on a reddish, highly burnished ribbed surface, with the gradual abandonment of polychrome decoration. The Assyrian commercial colonies were swept away and destroyed in the wars that broke out between the small states in their attempt to gain political ascendancy. Pithanas and Anittas — apart from whether they are to be considered of the same stock as the subsequent Hittite dynasty or not — set out to conquer that territory which was to become the homeland and headquarters of the Hittite kingdom. The phenomenon of the conquest of power and its concentration in the hands of a few people was not an isolated one; in the 19th century B.C., at Beycesultan in western Anatolia, an independent state was set up whose identity is still the object of dispute, and the sixth city of Troy constitutes yet another example (though in this particular instance, its culture clearly moved in the Aegean orbit). In a later period, there is evidence of a series of states strewn along the borders of the Hittite empire, but for the moment their identity, often even their location, is still open to question (see HITTITE ART).

The Hittite Old Kingdom (ca. 1650–1450 B.C.) was born of these internecine wars and asserted itself as the ruling power; but although the Hittite ethnic element prevailed, other nationalities were mixed with it, so that it is often improperly described as a federation rather than as a centralized regime. Material culture on the whole follows the lines of the foregoing period, though with some slight differences. It was during this period that the Hittites entered into contact with the great Near Eastern empires and their civilizations assimilated much from them, drawing new concepts, especially among the privileged political and cultural classes, and paving the way for the more substantial changes which marked the following period.

It was during the period of the Hittite empire (1450–1180 B.C.) that the monarchy assumed greater continuity, after the palace uprisings which had brought the early kingdom to a rather inglorious end, proceeding to the posthumous deification of the king and to the assimilation of Hurrian gods into the national pantheon. This was principally brought about through marriages to Mitannian princesses and frequent contacts with the other Near Eastern empires — especially Egypt — both in war and in peace.

The known monuments are ascribed to the Hittite empire period; it is to be noted that the art is essentially aulic and religious, and that popular, non-religious art is lacking. Suppiluliumas (1375–1335 B.C.) enlarged the capital city, Hattushash (mod. Boğazköy), furnishing it with a massive defense system which included three main gates, the Lion Gate (VII, PL. 280), the Gate of the Sphinxes, and the so-called "Royal Gate," decorated with reliefs (I, PL. 518; VII, PL. 280; XIII, PL. 220). These are the only extant examples of high-relief representations on a monumental scale (though it is known that religious statues also existed); they are of the greatest interest because, together with the Gate of the Sphinxes at Alaca Hüyük, they foreshadow the custom of setting apotropaic animals at the entranceways (a common practice in the art of northern Syria of the 1st millennium and in Assyria). The five temples of the capital, and especially that of the lower city, give an idea of the importance of religious worship in the life of the Hittites (already attested to by the documents; the king would interrupt his military campaigns, if it were at all possible, to preside in his capacity as high priest over the periodic religious ceremonials); a circle of spacious storerooms and archives led to the central court and from there, indirectly, to the sanctuary in which the statue of the god, illuminated by side windows, was located.

The citadel, conceived on a monumental scale, contained not only the palace, but audience chambers, the archives, and other lesser buildings as well. The carvings that decorated the town gate of Alaca Hüyük may also be ascribed to the empire period; in them religious scenes and gaming and hunting scenes were set in uninterrupted succession along orthostats. The sphinxes, four in number, were placed along the jambs of the gate. The national pantheon, of Hurrian origin, is depicted in the rock-wall shrine of Yazılıkaya (VII, PL. 279), near Boğazköy. Here Teshub and Hepat are shown meeting, with a long procession of minor gods spread out on either side. In a secluded recess are to be found the so-called "Dagger God" and King Tudhaliyas IV held tightly in the arms of the "Boy God." The carving is, in general, delicately modeled. These works, together with the gems and glyptics and other minor arts, prove that Hittite art during imperial times, while assimilating traditions and influences from other civilizations, had attained an independent, typically Anatolian style of its own.

The complex cultural and political world of the Hittite empire was destroyed about 1180 by the uprisings that swept through Anatolia, Syria, and Palestine, ultimately disintegrating at the borders of Egypt; these disturbances are attributed to those mysterious tribes known under the general name of "Peoples of the Sea." Not very long before, Homeric Troy had fallen, after an intense commercial and colonial penetration on the part of the Mycenaeans, who had been active along virtually the entire Anatolian coast — from the Hellespont to the Gulf of Alexandretta. While all traces of the Hittite empire were lost on the Anatolian highlands, the cultural and, to a certain extent, the political traditions survived in such outlying regions as southeast Anatolia and northern Syria, where the tide of invasion had not arrived or where, as some authorities maintain, groups of Hittites from the highlands had taken refuge to swell the ranks of those who had settled there in imperial times to assure the borders greater stability. The cultural and political history of these kingdoms, also known as Neo-Hittite, splits up into a series of local episodes, so that the generally accepted principle that the ascendancy to empire was the privilege of the prevailing ethnic element undergoes considerable variation (note, for example, how Aramaic elements reached as far as Marash, that is, to the heart of the Taurus Mountains). Carchemish and Malatya were the two main centers that maintained closer ties with the past, with Carchemish playing an important role as the viceregal seat for the maintaining of order in this turbulent border district. The art, in general, even though the iconography frequently reverted to that of the imperial age, took on distinct features and a new style, though with considerable unevenness of quality. Typical is the extensive application of orthostats decorated with reliefs to the walls of the so-called *bît-hilani*, that is, the princely residence, which, while an original invention of this area in that period, was later to take another form borrowed from Assyria. The subject matter of these carvings is not essentially religious, but includes (aside from evil spirits, possibly of Mitanni origin) scenes of everyday life and war motifs. From time to time, Assyrian (Carchemish) or Phoenician (Karatepe) influences have been detected in the development of this monumental art,

but it is more likely that the art, while depending to a certain extent upon foreign influences, acquired unity and coherence within a local artistic framework. The differences are largely due to the varying skill of the craftsmen and to the diverse periods in which individual series of works were produced. Assyrian influence is clearly discernible during the last years of these states, that is, just before the Neo-Hittite kingdoms were reduced to metropolitan provinces in about 700 B.C. by the powerful bordering state.

The Urartu (q.v.) kingdom, successor (in terms of ethnos and language) to the Hurrian nation, flourished between the 9th and the 6th century in the Lake Van area; notable for its unvarying opposition to Assyria, Urartu assumes particular importance in that it was responsible for introducing Eastern iconographic motifs into the west through its rich production of bronzes. The most important center on Lake Van, Toprak-kale, was despoiled at the end of the 19th century and the finds have only lately become the object of serious study. At Altintepe, near Erzincan, recent explorations have brought to light the remains of a square temple containing rich tombs and numerous bronzes. Much of the information about this kingdom and this civilization was supplied by the Assyrians, who forced the Urartians to withdraw to their original borders after a period of expansion during which Urartian rule had extended all the way to the Orontes. Their final disappearance from the Near Eastern political scene was brought about by the Cimmerians, who also suppressed the Phrygians.

Paolo Emilio PECORELLA

Phrygians, Lydians, Ionians. After the destruction wrought by the Peoples of the Sea, the Anatolian plateau remained sparsely populated. This is the darkest period in its history; however, it is not unlikely that future explorations will succeed in narrowing the cultural gap covering the 11th to the 8th century, as is now being done in northern Syria.

It was at the beginning of the 8th century that the Anatolian populations came into contact with the Greek world and Western influences mingled with local traditions to give rise to Phrygian and subsequently to Lydian and Carian culture. Thus these regions appear as individual provinces of a widespread Anatolian artistic style, and it is not always easy to establish just how much was received from, and how much was given to, the Greeks, especially within the Iranian orbit (see ASIA MINOR, WESTERN: PRE-GREEK CULTURES; EARLY GREEK INFLUENCES).

Historically, the Phrygians, having established themselves in small principalities to the east of the Halys (Kızıl Irmak) joined together into a "federal" monarchy with its principal center at Gordium (Gr. Gordion) around the turn of the 8th century, but the invasion of the Cimmerians arrested the cultural development, driving the population westward (Eskişehir region), where the "City of Midas" (Yazılıkaya) and numerous rock-wall monuments testify to a last late flowering. Worthy of note, along with the general architectural features of private houses, temples, and rock-hewn shrines, are the peculiar polychrome decorations on clay panels, abounding in mythical figures and battle scenes (Pazarlı and Gordium). Geometric patterns, prevalent in their pottery, were also used in the large flat bands set as borders around the fronts of the rock-hewn monuments (I, PLS. 528, 529, 530, 532).

The Gordium tombs (mostly 8th cent. B.C.), large tumuli each containing a room paneled in wood, are the prototypes of the many other tombs appearing throughout Asia Minor until Roman times; they express the beliefs and styles shared by many different populations over a long period of time. Other tombs in Paphlagonia have columns and pediments and resemble Greek structures; heraldic animals often decorate the façades (at Kalekapı, set along the imposts and in the pediment).

The same informing spirit is also found in the decoration of Phrygian vases, which may be divided into four different styles: the earliest, corresponding to the mature and late stages of the Greek Geometric style; the transitional style; the Phrygian style proper, which presents a wide range of subjects divided into three subclasses, the last of which (the decadent) is akin to examples imported from Greece; and the late Phrygian style, which covers the last century of Phrygian culture, up to 500 B.C. The third group includes examples, magnificent in the originality of their form and in the quality of their decoration (squares, meanders, crossed lines, highly stylized animals), which often covers the entire vase. Phrygian stylization is profoundly different from that of the Greek Geometric style (q.v.). It has the flavor of an attractive folk art; the wild animals and the figures, in double outline, still within the orbit of Asiatic tradition, are set into an ornamental composition broken up into distinct areas.

The Lycians have also left evidence of an original artistic concept in their tombs, the façades of which were frequently carved into the sides of cliffs (such as at Myra, Telmessos): they were very likely imitations of conventional local wooden building types, copied down to the last detail (crossbeamings, fixtures); the roofs were flat (in imitation of mud roofing) or ridged with pointed or triangular pediments.

Lydian (I, PL. 541) and Carian art bear an obvious relation to Phrygian art; at Sardis, the capital of Lydia in the 7th and 6th centuries (up to 546 B.C., when it was conquered by the Persians), architectural terra cottas were found that are similar to Phrygian works but whose subjects seem nearer to Eastern tastes: chariots and banqueting scenes were added to the usual Phrygian repertory. Very little information is available on Carian art. It was associated, it would seem, with the Greek tribes that had settled down along the Anatolian coasts, but there is meager documentation of the activities of the Carians in the 7th and 6th centuries.

Little is known about the art of the other tribes entrenched along the coasts of Asia Minor in the 8th, in the 7th, and in the first half of the 6th century, and even less about the artistic life of Anatolia under the Persians, that is from the middle of the 6th century to the time of Alexander the Great.

As to the archaic architectural monuments of the Troad (Neandris, Assos) and Ionian (Larisa on the Hermus, Ephesus, Miletus, Erythrae and, though outside the present confines of Turkey, Samos) cultures, there are not enough of them for a complete survey to be drawn of this art and of the relations between Ionia, Phrygia, and Lycia. Nor is the art of the late archaic period and of the 5th century known. The sculpture of Trysa (Gölbaşi), Xantos, Myra (tombs), and the pottery uncovered at Gordium and Sardis, prove, nevertheless, that during the Persian occupation some usually secluded centers enjoyed a certain independence within the satrapy system, and that consequently Greek influence was deeply felt also in the field of art, both directly, as a result of the presence of artists summoned from Greece, and indirectly, through the importation of Greek art.

Hellenistic age. Hellenistic culture spread rapidly through Asia Minor after Alexander the Great; the free colonization of the vast territory led to the creation of many new cities and to profound changes in already existent ones (see HELLENISTIC ART). Among the city-states that sprang up in Asia Minor, the most important was the Seleucid kingdom in Syria, from which the Pergamum kingdom broke away in 280; the Seleucids were then conquered in 190 by Rome in alliance with Pergamum and were virtually eradicated from Anatolia. Roman rule was not to assert itself, however, until the end of the 1st century B.C., after the abortive rebellion headed by Mithridates IV Eupator and the victories of Lucullus and Pompey.

During the centuries leading up to the Augustan Age, the cities of Asia Minor had enjoyed a certain autonomy, though many had been built (also as forts) by Seleucid kings (and named in honor of some king or queen: Seleucis, Antioch, Apamea, Laodicea, Stratonicea) and Pergamum kings (Attaleia). Encircled by walls, and containing a bouleuterion for the gathering of the representatives of the people, some of these cities were the capitals of small independent states.

In these small centers, confined to the needs of a municipal form of life, public works were fashioned with exquisite lines, but were of modest dimensions; the shafts of the columns, the capitals, and the architraves are of stone, obviously the product of fine workmanship, but ornamental carvings are limited. There is good taste in the design and in the contours of the moldings, but there is no display of luxury. Monumental structures also existed, however, such as the Great Altar of Zeus at Pergamum (VII, PLS. 172–74) and the temple-tomb of King Antiochos I of Commagene at Nimrud Dagh, which seem to represent exceptions to this rule. These monuments were intended to glorify the kings and their power, and therefore were built in a style that distinguished them from the usual buildings; Nimrud Dagh shows traces of Persian influence.

Hellenistic architecture, moreover, cannot be fully appreciated without taking into consideration its ties with sculpture; the Greek artists who settled in Asia Minor created thriving schools whose works are to be seen on the monuments. The extant products of the first Pergamene school (second half of the 3rd century B.C.) are the well-known groups and statues: Marsyas flayed, Ariadne, the Hermaphrodite; and in the great Pergamum altar reliefs the second school (first half of the 3d century) gives token of the technical skill of its artists.

The Pergamene school maintained its vitality for a long period of time; it may be detected in the Temple of Artemis at Magnesia-on-the-Maeander (ca. 170–100 B.C.), animated by scenes of Greeks and Amazons in battle, and later (88–85 B.C.) in a statuette of Hercules liberating Prometheus, alluding to Mithridates the Liberator; other trends showed an almost rococo elegance, or a distinct return to classicism (2d and 1st centuries B.C.).

The temples themselves, with rare exceptions, sought not to astonish the mind of the observer by means of imposing masses, but rather to conquer his spirit with harmonious proportions and subtle details. They are often encircled by a peribolus (a columned portico), as at Priene, sometimes symmetrically disposed (Teos). The order is

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

usually Ionic, the most closely linked to local tradition, rarely Doric (Troy, Temple of Athena, and Pergamum) or Corinthian.

A typical expression of Greek rationality is to be found in the urban planning which takes up and applies, with a view to functionalism, the Hippodamian scheme. The urban center was the agora, a square with porticoes, shops, and commercial offices served by the main street, on one side of which (sometimes set slightly apart) was the "official zone" with the bouleuterion, the administrative offices, and small temples or special shrines. Within the town walls there was a theater, and often a stadium. The private houses, served mostly by narrow streets accessible only to pedestrians, were simple buildings, constructed of square-cut stones and mud; they were adorned by a few columns and simple frescoes.

The tombs of important personages such as the 8th–7th century royal tombs in Gordium and Sardis were often in the form of tumuli; the burial chamber was, however, roofed by stone barrel vaults or by stone slabs jutting out in successive layers. In rare instances more ambitious structures were built, usually in imitation of the Mausoleum of Halicarnassus (Belevi, near Ephesus).

Roman age. In the 1st century A.D., under the Roman Empire, the aspect of the cities of Asia Minor underwent a rapid change. The construction of lavish public works increased, giving the urban centers a luxurious character unknown up until that time; thus, during the Augustan Age, propylaeums were built in Antioch in Pisidia that gave onto a square, one side of which opened onto a semicircular space entered through a two-storied portico; the Temple of Augustus and Men was built on an axis with the hemicycle and during the reign of Tiberius a second large square was built in front of the propylaeum. Other imposing works date from the reign of Vespasian (temple dedicated to him in Ephesus) and Domitian (Hierapolis, tributary gate; Miletus, the nymphaeum). In this same century the great avenue of Perga was built. Its starting point was a great triple arch; pillared porticoes ran along either side and fountains down the middle.

City road systems frequently consisted of arcaded streets crossing at right angles; at the intersections small shrines were set up, with architraves, columns, and niches containing statues or fountains. The decoration on the buildings in the first half of the century was restrained and still bound to Hellenistic tradition (extensive use of the Doric order, fine moldings sparingly used on the archways and architraves, as in the Mazaeus Gate at Ephesus); but beginning with the reign of Claudius, delicate carvings appeared in the moldings. In the Flavian Age an extremely ornate style evolved which was to continue, with variations, to the time of Septimius Severus; it was characterized by finely wrought leaf patterns in the friezes and minute designs in the ornamental moldings and cornices.

First-century (A.D.) sculpture in Asia Minor still poses many unsolved problems. There are examples of carvings of extraordinary elagance on tombs (Hierapolis) and monumental buildings; those on the baths of Aphrodisias, dating probably from the Flavian Age, are an indication of the high quality of workmanship to be found in this center of production and exportation of sculpture. The 2d century marked the peak of the building activities in Asia Minor; cities competed with each other to secure the *neocoris* (the rank of custodian of the temple dedicated to the emperor) and erected extremely imposing buildings, sometimes with gigantic marble and granite columns and with colossal marble architraves. Some of these temples were set on a podium, in the Roman style (Temple of Trajan in Pergamum); other were given a special shape, as was the "Sanctuary of Serapis" (Kızıl Avlı; XII, PL. 188) in Pergamum. Sanctuaries for the worship of the emperor were also built which consisted of a large room adorned with niches and columns, preceded by a pillared vestibule with a coping and a peristyle (Side).

Nymphaeums, the marble-faced fountains that may at times be of monumental proportions, are to be found at Side, Aspendos, and Hierapolis; in the baths, the niches for the imperial cult opened into open rooms facing onto the outside peristyle (*Kaisersaal* in the baths of Vedius at Ephesus). City gates such as those at Attaleia (mod. Antalya) were frequently triple arches surmounted by a colonnade with pierced entablatures and pediments; the agoras of the 2d century were also supplied with highly decorated doorways in complex systems abounding in columns, cornices, and pediments (Miletus; XII, PL. 189).

The theaters of the 2d century were also adapted to contemporaneous tastes; the *frontes scaenae* were at first faced with coupled columns supporting simple pediments (Aspendos), later with architectural orders containing richer and more intricate elements (Ephesus, Hierapolis). During the reign of Hadrian these structures were still subdued in taste, but during the period of the Antonines (when the building of public works became a kind of craze, also with respect to the number of monuments built), they became complicated, almost florid in feeling.

Beginning with the Augustan Age, tombs frequently took the form of cubical stone shrines (rarely were there examples in marble with columns). These lined the roads leading into the cities; the best-preserved example in all of classical antiquity is at Hierapolis.

Considering the extraordinary development of cities in Asia Minor from the 1st century B.C. to the end of the 2d century of our era, the question arises as to what sources of economic wealth made it possible for so many magnificent buildings to be constructed. In the Roman period there were hundreds of cities in the area and rich and costly buildings were to be found everywhere; it must be concluded that these cities obtained their wealth from the flourishing of crafts and commerce — wool from Anatolia was made into textiles and magnificent rugs, marble was exported in the form of priceless sculpture, metal in that of finely chased objects. This also explains the abundance and the refinement of decorative sculpture — the assorted capitals with figures and leaf patterns, the elegant and delicately carved friezes — and the tasteful mosaic pavements (outstanding among them, the Antioch mosaics, X, PL. 177, with their vast figured compositions that give some idea of what the city's mural paintings, now lost, were like).

In the 3d century the situation changed rapidly; the reign of the Severan emperors may be considered a transitional period between the prosperity of the 2d and the near-poverty of the 3d and 4th centuries: the reason for this rapid decline is to be sought in the political situation, which degenerated from an enviable state of stability to chaos. The precariousness of political power advised the short-lived emperors against all unnecessary activities and, in particular, the building of lavish public works; it is likely that almost all the marble quarries and workshops were soon closed down.

The weakness of the Roman state led, throughout the empire, to the rise of a new social order, almost feudal in character, in which the *potentiores* were undisputed lords of vast dominions and the loss of wealth in large sections of a population burdened, on the one hand, by oppressive taxes and heavy war duties, and alarmed, on the other, by the lessening of Roman prestige, especially after the defeat and capture of Valerian by Shāpur I (260).

The vitality of the new Sassanian empire soon asserted itself, however, manifest not only in its military victories, but also in an intensification of its influence on the life and art of the former Roman province of Asia, so that evidences of Sassanian influence are to be found in the architecture, in the decorations, and in the tastes of Asia Minor in the 3d and 4th centuries. In particular, the public baths and palaces show influences of Sassanian technique and spirit; the traditional Hellenistic stone walls and wooden ceilings, columns, and architraves were replaced by brick walls and vaults, domes, and lively ornament.

An exact analysis of 3d- and 4th-century architecture in what is the territory of present-day Turkey is, however, impossible — there are too few monuments extant — but certain thermae in Aspendos, Magnesia-on-the-Maeandar and Ephesus (remains of the harbor baths and Baths of Scholastikia) make it possible to outline its various stages.

Late Roman and Byzantine age. The truly extraordinary development of civil life and art during the reign of Theodosius II, that is, immediately following the establishment of the Eastern Empire as an independent state, was both manifest and significant. In the beginning, however (that is, up until the death of Arcadius), sources of trouble were not lacking in Asia Minor. The new empire also had difficulty in keeping the public order; bands of Isaurian pirates raided the countryside, terrorizing the people, who were forced to erect temporary walls about their cities, which had previously been unfortified. With the passing of time, however, things went back to normal and the area known today as Turkey enjoyed a period of prosperity. Even so, the Eastern emperors were faced with a series of religious and political problems; since, having been converted to Christianity, they could no longer lay claim to the traditional honors of divinity, they sought to preserve their influence as the vicars of God on earth, but this obliged them to make substantial donations to bishops and monasteries and to take part directly in religious wars.

The account given in the *Vita Porphirii* (ca. 400) of the events regarding the construction of the Gaza church in Palestine proves that, when during the reign of Arcadius (395–408), the emperor intervened as donor and commissioner, he donated the marble columns as well as provided the building plans; thus, during early Byzantine times, the imperial workshops served as a powerful vehicle for the standardization and spreading of architectural types and finished marble pieces. This "court art" included magnificent basilicas modeled along traditional lines, as well as martyriums that at first were sepulchral monuments, elaborate in shape, where the ceremonial rites in honor of the martyrs were held.

The structural features of architecture of the Theodosian age were copied partly from classical models (monolithic shafts of colored marble, capitals and architraves carved in white marble, soffits, large windows) and partly from late Roman and Eastern models (brick arches supported by columns, walls with *opus sectile* facings, wooden-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

frame domes) and utilized typically Asian, and especially Sassanian, techniques (barrel and domical vaults without supporting frames). The sculpture of the late 4th and early 5th century in some cases still displayed an elegance worthy of the classical tradition (Serigüzel sarcophagus; II, PL. 468), but certain works reveal frontal compositions and a want of proportion in the figures, such as in the base of the Column of Theodosius in Istanbul (II, PL. 467; VII, PL. 265; IX, PL. 57).

These same observations apply to painting and mosaics; the mosaics of the imperial palace in Constantinople (II, PL. 437), in the exquisite rendering of the design of figures, masterfully worked out in perspective, and hence vivid and lively, bring to mind the flawless technique of the Hellenistic and Roman schools of Asia Minor, whereas in certain compositions and certain subjects, they are closer to the East. Even so, the compositional and formal elegance of the *palatium* pavements produced by the imperial workshops are a far cry from the geometrical plainness of most of the mosaic pavements of Asia Minor and Constantinople.

The method of carving the capitals and the finished marbles in general also underwent a rapid development in the course of only a few decades of the 5th century, reverting back to the drill and chisel technique popular during the Antonine Age; so that from the crudely modeled, coarsely scored decorations of the early Theodosian age (the Sırmakeş Hanı in Istanbul, the capitals of the octagonal martyrium in Hierapolis) there developed the delicate notching of the leafage and the openwork of the racemes in the Basilica of St. John in Studion, Istanbul (II, PL. 469) and the carvings in Alahan Monastır (Koca Kalesi, ca. 470; II, PL. 424); a similar technical evolution may be detected in the *plutei* and in other parts of the liturgical fittings.

In the 6th century, Christianity was securely established and those pagan temples still standing were either turned into churches or destroyed; thus, in addition to the hypostyle basilicas and martyriums of the traditional type massive churches and martyriums (SS. Sergius and Bacchus in Istanbul; II, PL. 426; FIG. 770) were also built, as well as immense cruciform basilicas roofed with domical vaults and domes (St. John, Ephesus; the "Cathedral" of Hierapolis). The masterpiece of the Justinian Age, Hagia Sophia, is unique; it is an immensely imaginative work in which many elements, either original or taken from Sassanian models (the great spherical vault), are sheathed in marble, whereas the wall facings in marble date back in part to the Roman tradition (see II, col. 773). Decorative sculpture in the 6th century continued in the tradition of drilled carvings; the openwork leaf decorations and the capitals of Hagia Sophia represent some of the finest products of the imperial workshops.

The mosaics of Hagia Sophia and of the Antioch pavements are vast carpets of richly inlaid geometrical and stylized floral patterns (seldom figures). Among the miniatures of the period, the Genesis Codices in Vienna (Nat. Bib.), the fragment of the Sinope Codex in the Louvre, and the "purple" codex of Rossano Calabro (X, PL. 67) are vivid examples in color of the prevailing tastes.

With the rapid rise of Islam in the 7th century, the area occupied by present-day Turkey became a battleground. Cilicia was seized almost immediately by the Arabs and remained in their possession until the 10th century; after the Arabs became masters of the sea, the coastal cities were repeatedly plundered and destroyed; many were razed, others reduced to mere villages. Consequently, the churches of the 11th century were small in size and vaulted in structure and generally had a plan in the form of an inscribed cross that represents a combination of the basilica and the martyrium.

The spiritual crises that afflicted the country also marked a shift in taste; the Eastern tendency toward abstract decoration was strengthened. Wall surfaces were sometimes covered with crosses, endlessly repeated in a border frame of geometric or highly stylized patterns (St. Irene, Istanbul; the older churches in Göreme, VII, PL. 408).

Traditional figural trends had not, however, completely died out; silverware in the time of Constans II (630–641) was still decorated with mythological figures, their movements modeled with vivacity and vigor.

With the 9th and 10th centuries, images were again permitted in the churches, but it was prohibited to introduce innovations of any sort into them; indeed, the iconography of the various figures and their arrangements in the composition had to observe minutely detailed rules. Abstract symbols were eliminated or reduced in number, but the figures were idealized and far removed from human reality. The figured frescoes of Göreme offer vivid testimony of this world of art and religious belief. In miniatures, however, together with marginal illustrations and geometric decorations of a popular cast inherited from the iconoclastic age, were found magnificent codices illuminated by court artists (Paris Psalter, II, PL. 480; XI, PL. 85) with full page illustrations and vast compositions borrowed from antiquity.

Architecture continued to labor under difficulties, with churches of medium or small dimensions, often in the form of an inscribed cross (Kalender Cami, Istanbul, possibly once the church of the monastery of Akataleptos). Even so, the 10th-century Armenian school deserves special attention: in the mountainous regions around Lake Van and beyond the present border between Russia and Turkey, the inhabitants joined together into a compact and strong kingdom that reached its zenith under the Bagratid dynasty in the late 10th and early 11th centuries. The buildings of this proud people were of freestone; the churches, capped by a dome terminating in a cone and sometimes decorated on the exterior with crude figure carvings, seem to foreshadow certain forms popular in Europe during the Romanesque period and for this reason are of considerable interest.

Seljuks. In 1071 in Armenia there occurred the event that was decisive for the fate of the Byzantine Empire: the Seljuk Turks, routing the Byzantine army and capturing the emperor, Romanus IV Diogenes, swept into Anatolia like a raging tide. Opposed by the Byzantines and the Crusaders, the Turks were, however, unable to carry their conquest to immediate completion. The Byzantine emperors retained control over the area around the capital; the Armenians came to a halt in Cilicia and established there a kingdom that endured until 1375. Even so, the Turks had conquered most of Anatolia, where they set up various sultanates. Of these, the sultanate of Rum was the most powerful, and extremely important monuments from the 13th century are still to be found in its capital (Konya). The Seljuk sultans, fervent defenders of the faith, erected mosques and madrasahs in all the Anatolian cities, and built monumental inns for travelers and pilgrims on their way to Mecca. Architecturally these buildings owe little or nothing to the Byzantine heritage, except perhaps in Armenia where certain turbehs (tombs) and several mosques show the influence of local forms, decorations, and techniques. But, generally speaking, the plans of the wooden-pillared mosques, the star-coffered ceilings, the stalactites over the doorways, the predominantly geometric decoration, are all Islamic features drawn, in part, from the artistic resources of Persia (see IRAN; ISLAM; SELJUK ART). Especially Iranian in inspiration are the doorways set in wide stone frames, the magnificent brick facings arranged in patterns, and the brilliant surfacing of brightly enameled tiles.

The greatest accomplishment of the Seljuk sultans was, however, the bringing of peace to, and the reorganization of, Anatolia. They found the country in a state of utter prostration; countless ancient cities had been reduced to squalid villages, others destroyed. The Seljuks built new towns (Alanya), restored already-existing ones along lines different from those of classical times, and reactivated the communication routes, supplying them with bridges and caravansaries and bringing about in this way the resumption of civilized life.

Evidence of the vitality of the Islamic peoples during the 13th and 14th centuries is also to be found in Byzantine culture: among other things, certain monuments from the time of the Palaeologian emperors in Istanbul show Seljuk influence in the rich polychrome colorings of the walls (the "Palace of Constantine," the Church of S. Mary Pammakaristos, known as the Theotokos), though the mosaics and the painting from the time of the Palaeologians seem also to reflect Western tastes and to present analogies with the monuments of Italian painting which can not be explained merely as the result of the transfer of ideas (and later of artists) from Constantinople to the West.

Ottomans. The work begun by the Seljuks was completed by the Ottoman rulers (see OTTOMAN SCHOOLS), who brought all the Islamic provinces together into a single unified state, which they extended to include the bordering countries until they had built an immense empire.

In the beginning, the Ottoman dynasty wielded its power in the region between Eskişehir and Brussa (Bursa). In the latter city, which was originally the Ottoman capital, only a few buildings are left that date from the second half of the 14th century, so that in order to have an idea of the style prevalent at that time, reference must also be made to İznik, Miletus, and Aya Soluk (anc. Ephesus).

One mosque (the Ulu Cami in Bursa; X, PL. 443) has twenty small domes with intermediate piers; others (the Nīlūfer Hatun Imāret and the Yakub Çelebi Zaviye at İznik) are T-shaped; still others are square with a single dome and with a portico in front.

The T-plan, evolved from the Seljuk madrasahs of Konya in the roofing over of the courtyard in front of the liwan, was used in the two important mosques of Bursa, the Beyazıt Yıldırım Cami (ca. 1400) and the Yeşil Cami, or Green Mosque, of Mehmet I (1421), as well as, a few years later, in the Muradiye Cami of Edirne (1435–1436). The Great Mosque of Ephesus (1375), built by Isa Bey II, is Syrian in type and stands in a class of its own.

The art of this period cannot be discussed without giving a special place to the enameled ceramic tiles which represent one of its most striking architectural features. The facings on the minaret of the Mehmet Çelebi Cami in İznik and inside the Yeşil Cami in Bursa and the Muradiye in Edirne are in various tones of

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

blue and green and are among the most beautiful products of all Islamic art. They are supplemented by decorative frescoes of which nothing has remained except fragments in the above-mentioned mosques of Bursa and Edirne.

A new type of mosque appeared in Edirne with the Uç Serefeli Cami; surmounted by an enormous central dome, the collateral rooms are mere appendages to the main hall; the plan, on a hexagonal nucleus, is also found in the Manisa mosque.

This enlarging of the dome met with great success in Ottoman architecture, also because it coincided with local tastes and traditions. It was to reappear frequently in the 16th century, inserted into more or less complex plans. Typical of this stage of architecture are the numerous works by the architect Sinān (q.v.), especially the mosques, conceived along more or less simple lines, depending upon the size. The masterpiece of this prolific architect was the Selimiye at Edirne with an octagonal nucleus. But there are other mosques of outstanding quality to be seen in Istanbul (Süleymaniye, Mihrimah). In them, the effect of the outer mass is softened by small domes and buttresses, or by numerous windows, and the interiors are glowing with color and steeped in shadows.

The ceramic decoration in this century became lighter and more vivacious in color: white tiles painted with bright colored flowers and arabesques were popular; the colors, applied in thick coats, make for a heavier surface and therefore emerge strong and pure. The ceramic facings of the Selimiye at Edirne and of the mosques in Istanbul (the most magnificent being the Rūstam Paşa) offer striking proof of the technical level attained by the İznik imperial workshop.

After the death of Sinān, and following in the wake of the tradition he established, the Ahmet I and Valide (Yeni Cami) mosques were built in Istanbul, their interiors adorned with magnificent ceramics. Dating from the previous century is the Mosque of Selīm I, which applies on a monumental scale the same simple and stately plan of a cubical structure surmounted by a dome seen in innumerable Turkish cities and villages. Ottoman religious architecture then spread to the Mediterranean cities of the empire, to Syria, Palestine, and Egypt.

The Ottoman caravansaries consisted of courtyards surrounded by several levels of galleries and storerooms; they were essentially commercial emporiums for the storing of goods and the providing of temporary lodgings.

European influences and contemporary trends. The "Turkish baroque" is of considerable interest. Until the 18th century, Turkey had been largely confined within the world of Islam. During the 18th century, the new foments in European culture were also felt in Istanbul, and in the second half of the century the sultans (especially Selīm III, 1789–1808) took keen interest in Europe and in France in particular. This new situation was reflected in the Nuru Osmaniye and Lāleli mosques, and in many of the fountains and rooms of the Topkapı Saray, with their fancifully curving cornices in the baroque style and a profusion of rococo ornaments.

In the early decades of the 19th century, these works had their counterpart in others inspired by neo-classical principles: the Nusretiye Mosque at Tophane and the Türbe of Sultan Mahmut in the Divan Yolu are examples of local interpretations — loaded with ornament, but expressive — of the prevailing European style. The mid-19th century palaces are a riot of columns, friezes, curlicues, ornamental plaques, and moldings fashioned of white marble or molded cast iron.

The criticisms brought against these monuments up until only recently now require reexamination: the Yeni Köşk (1840) and the Dolmabahçe Palace (1852) in Istanbul are well-defined expressions of a different sort of oriental taste and are in no way inferior, in their originality and in their mastery of effects, to certain of the Louis Philippe and Second Empire monuments to be found in Europe.

Paolo VERZONE

The first attempts to introduce the principles of modern European functional architecture into Turkey date from the third decade of the 20th century. The first achievements in this area, made possible through the use of new building materials, were the work of two Turkish architects, Zeki Zayar (private house, Istanbul, 1937; villa, Suadiye, 1937) and Sedat Hakki Eldem (health resort hotel, Yalova, 1937–38). It was only after World War II, however, that the principles of international modern architecture were widely adopted in public and private buildings in the large cities. This new approach to building and town planning has given rise, in the old Turkish cities, to new commercial and administrative centers and new residential districts, largely European in appearance (i.e., Ataturk Boulevard in Ankara). Recent economic prosperity has led, moreover, to the construction of modern industrial plants in the suburban and rural areas. Outstanding among these, for the modernity of the architectural and technical procedures adopted, are the Karabük steel works, the factory in Kayseri, the Raman and Mersin refineries, and the Mersin grain elevators.

In the years after World War II Turkey has had to deal with the serious problem of overpopulation in the cities and consequently to set up a town-planning program which would permit the residential districts to be sufficiently developed and at the same time would assure the protection of the historical centers. The problem becomes even more serious in those cities in which improvident urban reforms carried out in the middle of the 19th century, with the demolition of the old quarters, the laying out of broad streets and the construction of modern quarters close by the historical-monumental centers, have modified the old urban structure without providing an adequate solution to the subsequent growth of the city. Recent town-planning schemes tend to obviate these drawbacks by spreading out the built-up areas, by restoring the monumental centers, and by creating new suburban residential districts. Guided by these new town-planning principles, it has also been possible to save the numerous parks and gardens that constitute one of the most attractive features of many ancient Turkish cities (e.g., Bursa).

MONUMENTAL CENTERS. *Historical topography.* In the 3d and 2d millenniums part of Asia Minor was an Assyrian colony (excavation finds at Kültepe), whereas the indigenous peoples were perhaps the Proto-Hatti, who seem to be the oldest known population in Asia Minor and Syria. By 1600 B.C. the entire Anatolian area was ruled by the Hittites. In the 1st millennium the population distribution may be reconstructed as follows: the northwestern mountains were inhabited by the Mosci (called by the Assyrians Muški and Muškayē); the southwest, up to the Taurus range, by the Tibareni; the central plateau by the Cappadocians; the area between the Taurus and the River Halys by the Cataonians; the central Taurus by the Pisidians, the Isaurians, the Lycaonians, and the Solimi; the southeast by the Cilicians; the southern coast by the Pamphylians; the middle of the peninsula by the Phrygians; the coast of the Black Sea by the Paphlagonians; the mountains of northwestern Phrygia by the Mysians; the area south of the Mysian territory by the Lydians, with Sardis as their capital; the southern coast, between the Carian and Pamphylian territory, by the Lycians.

The question as to the origins of the Greek centers of Asia Minor is still open to debate, but it seems that the colonization on the part of Hellenic tribes took place largely during the Iron Age (see GREEK ART, EASTERN). As the kingdom of Lydia grew in power, a series of wars took place, starting in the 7th century, between the Lydians and the Greeks. Then, after the establishment of the Persian Kingdom in 550 B.C., wars between the Greeks and the Persians culminated in the conquest by Alexander the Great. At his death, various apportionments saw the Seleucids gain control over the entire part of the peninsula west of the Taurus, whereas, following the invasion of the Gauls, the new kingdom of Galatia was formed. The decline of the Seleucids also marked the decline of Hellenism in the East. At the death of Trajan (A.D. 117), the Roman province of Asia Minor included: Proconsular Asia, comprising the central region and the islands; Bithynia and Pontus, along the coast of the Euxine sea; Lycia and Pamphylia, to the south, also including a part of Pisidia; Cilicia, along the southern coast; Galatia, including Lycaonia and Paphlagonia; and Cappadocia, the easternmost part.

The political reforms begun by Diocletian and the division of the empire into dioceses led to a new distribution of the regions of Anatolia within the confines of the Roman Empire. From the end of the 4th to the middle of the 6th century the provinces were divided as follows: the Asian Diocese, including the Hellespont, Proconsular Asia, the off-shore islands, Caria, Lydia, Pacatian Phrygia, Salutare Phrygia, Lycaonia, Pisidia, Pamphylia, and Lycia; the Pontic Diocese, including Bithynia, the Onoria province, Paphlagonia, Hellenopontus, Polemonic Pontus, Proconsular Galatia, Salutare Galatia, Cappadocia Major, Cappadocia Minor, Armenia Major, and Armenia Minor; the Diocese of Oriens, including Isauria, Cilicia Major, Cilicia Minor, and the island of Cyprus.

Justinian rearranged the territorial borders of the provinces in Asia Minor: opposite Byzantium he set up the small province of Pontus Major, with Kalchedon (Chalcedon) as the administrative center, and out of the Armenian territory, a part of Polemonic Pontus and the Euphrates region, he formed four provinces, all of them called Armenia (I, II, III, IV). Moreover, he partially eliminated the clear separation between civil and military authority established by Diocletian, hence foreshadowing the institution of the themes governed by *strategoi*, introduced in the 7th century when the emperor Heraclius gathered the necessary military forces in Anatolia for checking the Sassanian attack. Instead of an impromptu organization thrown together in the moment of danger, a veritable reform of the provincial administration was undertaken, as a result of which the province corresponded to the military unit. The area existed under this thematic regime for five centuries, withstanding the Arabian attempts at invasion in the 7th and 8th centuries, until the arrival of the Seljuk Turks, followed by the Ottomans, who carried the conquest and the Islamic conversion of the country to completion. In 1453, when Constantinople fell into Ottoman hands, the history of Turkey became part of the history of the Ottoman Empire.

The present-day Republic of Turkey, which rose from the ashes of the Ottoman Empire, was proclaimed on October 29, 1923 with Mustafa Kemal as president. Administratively it is divided into 58 vilayet (provinces); the vilayet are in turn divided into *kaza* (districts), the *kaza* into *nahiye* (counties), and the *nahiye* into *kasaba*, or villages.

In the following exposition the monumental centers have been grouped into two regions: Asiatic Turkey and European Turkey.

Asiatic Turkey. Ankara (anc. Ancyra). Capital of the Turkish Republic since October 1, 1923, Ankara occupies an important strategic position as a center of dissemination for all of Anatolia. Already inhabited in Phrygian times, it was ruled by the Lydians and the Persians; it then passed to the Seleucids and, during the 3d century, to the house of Attalus. In 278–277 B.C., it was occupied by the Gauls and became the capital of the Tectosages within the Galatian confederation. When the kingdom of Galatia was annexed by Rome in 25 B.C., Ancyra became the administrative capital of the new province. The city was important throughout the Roman imperial age and the early centuries of the Byzantine Empire, but beginning in the 7th century, it went into a rapid decline as a result of the invasions of the Sassanians (620) and later of the Arabs (654, 708, 806, 838), who took possession of it in 931. After the victorious battle of Manzikert (1071), the Turks seized it from the Byzantines and, except for a brief occupation by the Crusaders (1011–1127), retained possession of it. An important caravan center on the route to Persia, it regained a certain prosperity under Ottoman rule, when it became known as Ankara. After having been a center of the national resistance movement during the Greek occupation in 1920, it was made the capital of the new Turkish Republic in 1923.

A necropolis which came to light during excavations for the railroad station has been attributed to the Phrygian period (5th cent. B.C.). The most important classical monument is the Temple of Rome and Augustus; dating from perhaps the 2d century B.C., it is a Corinthian octastyle peripteral temple and bears the testament of Augustus carved in Greek and Latin on the walls of the sanctuary. Another important Roman structure is the public baths, dating from the late 2d or the beginning of the 3d century; the plan is of the type common in Asia Minor and contains a large communicating quadriporticus. Apart from an interesting tomb with frescoed rooms (4th cent.), a commemorative column is all that remains of the late Roman Age. The Byzantine fortifications of the citadel, consisting of a lower wall and a massive upper wall, are, instead, well preserved. The lower wall had a double-tower gate and the upper wall (A.D. 858), completely furnished with beaked turrets, was entered through a square gate projecting from the wall; a round tower was attached to one of the corners. The Konya sultans completed and restored the Byzantine fortifications; a vast *enceinte* wall, now destroyed, was then built by the Ottomans to protect the city from marauders and rebels. Among the Seljuk mosques in Ankara, the most important

Ankara, plan of the original area. Principal monuments: (*a*) Roman baths; (*b*) Temple of Augustus and Haci Bayram Cami; (*c*) column; (*d*) walls of the citadel; (*e*) *bedesten* and Hittite Museum; (*f*) Ethnographic Museum; (*g*) Ahi Elvan Cami; (*h*) Arslan Hane Cami; (*i*) Yeni Cami; (*j*) Imaret Cami.

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

is the Arslan Hane Cami, rectangular in form with four rows of tall wooden columns, six to a row, and a stucco and ceramic mihrab. The mosque was apparently built in 1210, the mimbar in 1289, and important restorations were probably made in 1330. The Ahi Elvan Cami, similar but smaller in size, was built a little before 1382; another interesting mosque is the Alaeddin. Also notable is the old *bedesten* built between 1464 and 1471, with an inner nucleus of ten domes and shops set around the rectangular perimeter, and now housing the Archaeological Museum.

Since 1931, the modern city has developed in accordance with the town-planning scheme of the Austrian architect Jansen. Especially interesting are the Presidential Palace, the New Theater, and the Mausoleum of Ataturk, a vast complex of buildings set on a hill, built between 1944 and 1953 by the architects Emin Onat and Arhan Arad. Ethnological Museum; Archaeological Museum.

Aegae. This was a Mysian city built by the Aeolians on mountainous terrain overlooking the Kaikos and Maeander (Menderes) valleys. It was a part of the Lydian and Persian kingdoms, although it enjoyed a certain independence; conquered by Alexander the Great, it became a part of the Pergamum kingdom and, in 129 B.C., was incorporated into the Roman province of Asia. During the Middle Ages it was completely abandoned. Nothing of it remains now but a few ruins. The city was set out on terraces, one of which was occupied by the acropolis, another by the theater and its related buildings, and another by the stadium, similar in plan to the Pergamum stadium. Only a few sections of the oldest stone walls, in polygonal construction, are still preserved; the enlargements and additions dating from the Attalid period, which encompass the entire plateau, are in a better state. The agora is located in the northeastern part of the city and on the east side adjoins a three-story L-shaped building, the remains of a stoa from Hellenistic times (late 3d–early 2d cent. B.C.). On the west side of the acropolis were two peripteral temples, one of them set into a stoa with propylaea along the two sides. Below this temple is a terrace which to the north contained a small temple, at the center a theater hewn from the rock, and to the south a square with porticoes on three sides; all these buildings date from the Greek period. The other terrace contains the stadium. Scattered over the surrounding valleys and hills are various necropolises which have yielded rich grave fittings dating from classical antiquity.

Ahlatlibel. About nine miles south of Ankara, Ahlatlibel was an important point of contact between the culture of the highlands and that of western Anatolia and has provided useful clues for the dating of the earliest civilizations of central Anatolia. The site was inhabited mostly during the early Bronze Age I and II, but there are also traces of a later occupation. The monumental remains consist of a fortress or castle, about 130 ft. wide, where the residential quarters were contrived out of, or incorporated into, the wall itself, leaving an unevenly shaped open space in the middle. The thickness of the walls would seem to indicate that a second story existed, but the absence of thresholds makes it difficult to interpret the ruins. There are also traces of an earlier occupation; a necropolis has been discovered inside the fortress and another was built over it after the place was abandoned. According to some scholars, the fortress does not date from before the beginning of the early Central-Anatolian Bronze Age, and its destruction was contemporary with the destruction of the Alaca Hüyük civilization, to which the royal tombs belong; according to others, the occupation ended at a later period (judging by the pottery, which is more advanced in character) but still within the confines of the Early Bronze Age.

Aizani. A Phrygian city near the mouth of the Rhydakos, Aizani enjoyed its greatest prosperity during the Roman period. All that remains of the ancient city, situated near the Turkish village of Çavdarhisar, are the imposing ruins of the Temple of Zeus, a theater, and a stadium. The Temple of Zeus was pseudodipteral with 8 and 15 Ionic columns set on a plinth; the cella had four composite columns on the front and two more of the same order between the antae of the *opistodomos* courtyard. German excavations have brought to light the acroteria. The temple was set in a spacious colonnaded courtyard. The theater is poorly preserved, with the auditorium disposed in two sections of nine sloping blocks of seats and a rich *frons scaenae* with composite columns below and Corinthian columns above, which led to the stadium. The latter, however, was set on the same axis as the theater. In the stadium, which was rounded at one end and enclosed by the stage wall of the theater at the other, many rows of seats are still preserved.

Aksaray. Perhaps this was the ancient city of Kurshaura, but more likely it was built on the site of the Byzantine city Archelais. Occupied by the Seljuks at the end of the 11th century, it was temporarily taken over by the Mongolians, and then annexed by the Karaman beys. One of the most beautiful Seljuk caravansaries, Sultanhanı (VIII, PL. 161) is to be found there: it consists of a courtyard with lateral arcades and various chambers with a small, freestanding mosque in the center. At the far side of the courtyard stands a hall with five barrel-vaulted aisles. The portals are in stalactite form.

Bibliog. A. Gabriel, Monuments turcs d'Anatolie, 2 vols., Paris, 1931–34; B. Ünsal, Turkish Islamic Architecture in Seljuq and Ottoman Times, 1071–1923, London, 1959.

Alaca Hüyük. Situated about 12 miles from Boğazköy, the area was visited in 1835 by Hamilton, who located the Gate of the Sphinxes, was systematically investigated by Turkish archaeologists between 1935 and 1939 and between 1940 and 1948. Other test excavations are planned in order to more clearly establish the area covered by the Hittite city. During excavations, a sequence of four levels was uncovered. Level IV, dating from the Chalcolithic Age, shows characteristics similar to Level O at Alişar Hüyük. In Level III, dating from the early Bronze Age II, 13 rich pit graves roofed with beams have come to light; they belong to local dynasties, were probably located outside the city proper, and date from 2400–2200 B.C. In their rich abundance of grave fittings they have shed unexpected light upon the cultural level of this period in the Anatolian highlands, otherwise to be considered poor. The numerous articles of gold and pottery and especially the "standards" (I, PL. 517) and the anthropomorphic and zoomorphic figures made of bronze and various alloys would seem to link this culture to the regions to the north and northeast (Pontic area; they resemble, however, the objects from Maikop) through a series of other finds (Horoztepe, IX, PL. 417; Hasanoğlan). In Level II, dating from Hittite times, are the double-revetted walls with the Gate of the Sphinxes, of which only two of the original four sphinxes are extant. Two series of carvings, one of which is unfinished, on the front of the monumental entranceway, have been dated to the Old Kingdom (by Mellaart) or to the Hittite empire (by Frankfort, Vieyra, and others). Inside the city, joined to the Gate of the Sphinxes by a propylaeum, stands the palace, or more likely the temple, with an arcade along one side of the flagged courtyard, as well as a group of simpler buildings separated by narrow lanes. This period is divided into subphases and stretches from the time of the Assyrian colonies of Cappadocia (20th–19th cent. B.C.) to the end of the Hittite empire. The first level (post-Hittite) has yielded Phrygian pottery and inscriptions in archaic Phrygian; the architectural remains of this period are scanty.

Alahan Monastır. A vast complex of monastic buildings on the slopes of a mountain overlooking the great road between Mut and Selefke, Alahan Monastır was built in the late 5th century of the Christian Era. It consists of two large churches (1 and 3) set on an axis and linked by an outer arcade which runs along the right-hand side and is interrupted halfway along by a structure, probably a baptistery, of smaller dimensions and a richly decorated niche set in the front portico. Church 3, the best preserved, is ornamented with cornices and capitals and carved designs in the friezes. Church 1, now partially excavated by Gough, has three aisles; still standing *in situ* is the entrance door with sculptures on the piers depicting the archangels Michael and Gabriel treading on a serpent with a woman's head and the architrave with figures of the Cherubim (as described in the vision of Ezekiel). The monks' cells were hewn into the rock. Nearby is a rock church with frescoes probably dating from the iconoclastic period.

Alalakh (Tell Açana). The city situated on the Syrian border, on the northern banks of the Orontes, was excavated by C. L. Woolley between 1936 and 1949. It was inhabited uninterruptedly from the 4th millennium B.C. to the beginning of the 12th century B.C., when it was destroyed by the invasions of the Peoples of the Sea. It was the seat of a small kingdom which fell under the cultural influence at first of Mesopotamia and then (beginning with the 12th dynasty, beginning of the 2d millennium) of Egypt. At the end of the 12th dynasty, Alalakh became a part of the Semitic state of Yamhad, governed by the Amorite dynasties with Aleppo as their capital city. It was the royal residence of Yarim-Lim, a powerful king who was in touch with Hammurabi of Babylonia, and Zimrilim of Mari. It then reverted to Egyptian rule at the beginning of the 18th dynasty and was governed by a vassal dynasty founded by Niqmepa, at which time it enjoyed its greatest prosperity. Dating from this period are the numerous Akkadian tablets found there. The remains of a palace with mud brick columns of unquestionably Mesopotamian origin are dated to the 3d millennium (2700–2350 B.C.) as is a ruined temple with a forecourt and a raised sanctuary chamber. Much more interesting are the palaces of the 2d millennium, comparable to those of Crete. The Palace of Yarim-Lim (18th cent. B.C.) was divided into two wings by a large courtyard; its second floor was decorated with frescoes and it anticipated several elements which were to become typical of 1st-millennium Syrian structures — the *hilani* and the decorations on orthostats. The walls were of mud brick with a wooden framework. The Palace of Niqmepa (XIII, PL. 357), dating from the Late Bronze Age (end of 15th cent. B.C.), marks a transitional stage between the Palace of Yarim-Lim and the *hilani* and is comparable to the Palace of Ugarit, with which it is nearly contemporary. Dating from the same period is a temple with three consecutive chambers. Among the sculpture, a stone head, perhaps a portrait of Yarim-Lim (I, PL. 520), and a statue of Idri-mi (XIII, PL. 359), covered with a lengthy inscription, are notable. Also of great interest is the pottery, with decorated bands, in which the motifs of Hurrian earthenware are taken up. Cypriote and Mycenaean pottery have also been found. The finds of the 2d millennium are, according to the studies of S. Smith (*Alalakh and Chronology*, London, 1940), of key importance for the reconstruction of the chronology of the 2d millennium.

Alanya (anc. Coracesium). The tiny peninsula situated betwene Pamphylia and Cilicia Trachea, was, to all intents and purposes, a fortress. A mountain jutting into the sea and hence easy to defend, it was called in classical antiquity Korakesion or Coracesium, in Byzantine times Kalonoros (beautiful mountain), and following the Turkish conquest, Alāuiyya, after Alaeddin (Ar., 'Alā ud-Dīn Kaykūbad), who conquered it in 1221. Alaeddin undertook the building of massive fortifications (1226–31) and repopulated the village. The promontory, about 1½ miles long and 853 feet high, was protected by a handsome *enceinte* wall, still perfectly intact. The most

Alanya, plan. Principal monuments: (*a*) Kızıl Kule; (*b*) Tophane; (*c*) Mayyit Kapısı; (*d*) Kale Kapısı; (*e*) Ehmedek Fortress; (*f*) *han* and *bedesten*; (*g*) Süleymaniye Cami; (*h*) Byzantine church; (*i*) Iç Dale.

important monument among the fortifications is Kızıl Kule (the red tower), a massive octagonal fortress that bars access to the harbor. Nearby is the shipyard shed with pointed archways; another tower flanked the other side of the harbor. The most important of the gates into the city is Kale Kapısı; a stronghold, Ehmedek, looms large in the wall system. In the vicinity of this fortress lies the ancient commercial center with a *han* and a *bedesten*. A small fortress (Iç Kale), which contains within its walls a small Byzantine church, crowns the promontory.

Alinda (mod. Demir Cideresi). The history of this Carian city presents a number of serious gaps. A fortress city, it stood on a hill and was surrounded by turreted walls built of evenly cut blocks of granite, still in excellent condition. In the upper part of the city, a small well-preserved theater from Hellenic times is to be found, whereas the agora, supported on the valley side by a three-story construction, the base of which is still preserved, is situated in the lower part. Near the city are the remains of a Roman aqueduct on arches and numerous rock-cut tombs.

Alişar Hüyük. This was one of the first Anatolian sites explored (1927–32, by the University of Chicago). Unfortunately, certain difficulties came up at the beginning of the work, making it impossible to tabulate exactly the data obtained, for which reason various changes in the definitive publication were made necessary. The site did not yield archaeological remains referable to the period of Hittite political and military power. In fact, that period, which the excavation reports described as "Hittite imperial," was later recognized as belonging instead to the time when the Assyrian commercial colonies of Cappadocia were active and to the beginning of the ancient Hittite kingdom. No buildings of a monumental character were uncovered at Alişar, but the care with which excavations were carried out and the published results may well be considered an

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

essential reference point in Anatolian archaeology. Five levels have been identified. The earliest, Level O, pertains to the Chalcolithic Age. Pottery was hand turned, grayish or blackish in hue, and its most characteristic form was the so-called "fruit dish," with a long stem on a flaring base. K. Bittel (1939) has identified the existence of two subphases. The existence of a defensive wall around the inhabited area has yet to be verified. Early Bronze Age II is entered with Level I, which came immediately after the preceding period. Two subphases have been identified here, too; in the first only the citadel was fortified, but in the second the entire settlement was enclosed by a wall. Among the pottery, in which the color red prevails, and which shows, moreover, a close relationship to coeval types from the Anatolian highlands, the depas is particularly outstanding. This is Trojan in type, but with a decoration in red forming a cross on the inside. Tombs were intramural, like those of the previous period. Alişar I covers more or less the same period of time as Troy II (Early Bronze Age II); Alişar III is the most distinctive phase, being the habitat, in a certain sense, of the so-called "Cappadocian" pottery; this pottery, vividly decorated with geometric designs in two or three colors, was preceded by a so-called "intermediary" type, with more subdued decorations. Both types were also found at Kültepe. In this period, a massive wall, varying in thickness from 16 to 23 ft., was built around the city. The Middle Bronze Age, that period during which Assyrian merchants were active in Anatolia and the wars took place between those various principalities later consolidated into the Hittite kingdom, is represented at Alişar by Level II. Brilliantly decorated pottery was supplanted by another type distinguished by a red surface and highly refined forms. A new double-chambered wall encircled the entire inhabited district. Traces of the existence of the Assyrian *karum* (a sort of trade association) and several tablets have been found. The site was abandoned probably as a result of the wars for supremacy which broke out in the region; by about 1750 B.C. the city must have been all but deserted. Though Alişar was not to know the affluence of the Hittite empire, it was, however, to see that of the Phrygians. First a feudal castle was erected on the hill, and then the ancient city was resettled and a new and complicated series of fortifications was constructed. Life went on without any significant interruptions down to a period that might be termed Lydian.

Althamar (Aght'amar). This is an island on Lake Van, the residence of the Armenian Arunid kings (10th–11th cent.). All that remains of the palace block (10th cent.; architect: Manuel), which consisted of a many-storied palace with frescoes, a pier, and fortresses, is the inscribed-cross church (I, PL. 435), attached chapels (1316), a bell tower (18th cent.), and a four-columned *zhamatun* (1763), a building intended for both religious and civil functions. The exterior of the church is richly decorated with carvings (secular, religious, and mythological subjects) and ornamental sculptures, and the interior with frescoes and decorations in relief.

Amasya (former Amaseia). Capital of Pontus in pre-Roman and Roman times, this city passed from the Byzantines to the Moslems in 1075. In 1143 it was occupied by the Seljuks and at the end of the 14th century became a part of the Ottoman Empire. Certain parts of the fortifications of the citadel date from classical antiquity, with a series of subsidiary works (cisterns, galleries), dating from the 1st century B.C., as well as numerous rock-cut tombs. The city retains a certain number of Moslem buildings from the Seljuk and Ottoman periods, especially in the old quarter. Among them, mention may be made of the Gök Medrese Cami (Blue Mosque theological school), erected in 1276, whose prayer hall has three aisles, each containing five domes. The small Melik Hatun Bimarhane (hospital) has rooms with pointed vaults set around a central courtyard; the stone block walls are well preserved. The Burmali Minare Cami (spiral-minaret mosque) was built at the time of Keyhüsrev (Kayhusrau) II (1236–46). The prayer hall is surmounted by three domes and is lined with galleries on three sides. The Mausoleum of Halife Gazi (1146), an octagonal building of stone, dates from the time of the Danişmend emirs. The Turumtay Türbe (1278), rectangular in plan, dates from Seljuk times. The Beyazit Cami was built in 1486 by Beyazit II; next to it stands a theological school built by the same ruler.

Gabriel, Les monuments turcs d'Anatolie, II, Paris, 1934.

Anazarbe. The city was situated in the fertile Cilician plain, and just before the Christian Era was part of a small kingdom later abolished by the Romans (A.D. 17?). In Roman imperial times it enjoyed increasing prosperity until, at the beginning of the 3d century of the Christian Era, it was named the metropolis of a part of Cilicia; its good fortune continued under Byzantine rule (during which time it was known as Justinianapolis) until the 7th century, when the Arabs seized it from the Eastern emperors. During the brief return of the Byzantines in the 10th century, it was one of the centers reoccupied by the Christians; it then passed into the hands of the Armenians, who in 1103 made it the capital of their kingdom. With the fall of Armenia Minor, Anazarbe, devastated by numerous earthquakes, lost all importance and was abandoned; the ruins are about 35 miles from Adana. To the north, outside the city walls, are the remains of an aqueduct, possibly dating from the reign of Domitian. The Roman city was encircled by walls, which were restored and modified many times by the Byzantines, and of which several towers and one of the gates are still standing. Beyond this gate is a relatively well-preserved triple-vaulted triumphal arch from the 2d century A.D.; only a few remains still exist of the colonnaded street (worthy of note are the columns retaining brackets), the baths, the theater, the amphitheater, and the hippodrome. Also to be mentioned are the remains of a Byzantine aqueduct and of rock-cut tombs. The two city churches are of great interest; one of them is cruciform, the other (dedicated to the Apostles) contains a spacious curved apsidal ambulatory. A third church, hewn into the rock, was located outside the city walls. The castle overlooking the city was fortified at various times during the Byzantine periods and contains a well-preserved Armenian chapel built by King Thoros I (1110–29).

Ani. The largest city of medieval Armenia, Ani was founded in the 5th century as a fortress city. From the mid-10th to the mid-11th century, under the Bagratids, it was the capital of the Armenian kingdom (with a population of about 100,000); from the end of the 12th century it was the residence of the Zakharid princes. Almost completely destroyed in 1236 by the Mongols, Ani is known as a result of excavations conducted (from 1892) by N. J. Marr. The city (now divided by the Turko-Russian border) consisted of a fortified citadel, of the town proper (the *sahastan*) enclosed by a double stone wall with towers, and of a suburb; there was also an "underground" Ani made up of cave dwellings hollowed out of the rock of gorges. Remains include the palace church, a single-aisled basilica (7th cent.), and several works designed by the architect Trdat: the Cathedral, a domed basilica (989–1001) with nave and two side aisles; the round three-storied Church of St. Gregory (Gagik; 1001–10), a replica of the Zvart'nots church; and several two-storied round churches (St. Gregory, Holy Saviour); and a church by Tigran Honents, of the domed hall type, decorated with ornamental sculpture and frescoes. Various palaces also came to light during excavations as well as popular living quarters, shops, workshops, and baths.

Antalya (Adalia; anc. Attaleia). Founded in the middle of the 2d century B.C. by Attalus II, King of Pergamum, and then in 129 B.C. incorporated, together with the Pergamene kingdom, into the Roman state, Attaleia was a small city with a good harbor and was well protected by walls; for this reason, in the 8th century it was chosen by the Byzantines as a center of residence, whereas Side, the ancient metropolis of Pamphylia, was abandoned. Occupied by the first Crusaders, it was used as a clearing-station and embarkation point for Palestine. Absorbed into the Sultanate of Rum in 1207, it was annexed to the Ottoman Empire toward the end of the 15th century, when it became known as Antalya. There are still many remains of the ancient city walls, but they were considerably restored, especially during late Byzantine times; in one of the towers there is a Roman plaque referring to one Julia Sancta as having commissioned restorations, while others bear inscriptions dedicated to Constantine VII Porphyrogenitus (912–59). The monumental gate built at the time of Hadrian (heavily restored) is triple vaulted and has freestanding columns on either side supporting the rim of the projecting entablatures. Nothing of the second order remains. South of the city is a large round mausoleum from Roman imperial times. The magnificent 8th-century Panagia Church (see BYZANTINE ART, col. 778) is adorned with typical carved decorations and with traces of frescoes. This masterpiece of the Byzantine period is falling into decay. An interesting Seljuk structure is the great Yivli Minare, the sole remaining portion of a mosque, which bears an inscription from 1219–1236. The minaret tower itself is formed by a cluster of eight brick columns tiled with turquoise-blue ceramics; these support the balcony for the muezzin and are topped by a small cell with a conical roof. The adjoining theological school building now houses the Archaeological Museum.

Antioch (mod. Antakya). Founded in 300 B.C. on the banks of the Orontes by Seleucus I as the capital of the immense kingdom of Syria, Antioch enjoyed great prosperity and was for more than 800 years one of the most important cultural centers of the Mediterranean. In 64 B.C., when it passed under Roman control, it was named capital of the province of Syria and embellished with numerous monuments and public works by various emperors. It continued to flourish perhaps up to the time of its destruction by the Persian king, Shāpur I; but even then, the city's prestige did not diminish, for it was the seat of the Metropolitan of the Eastern Christian realms. In 526 it was devastated by a terrible earthquake and in 540 was pillaged by Keyhüsrev; it fell into Arab hands in 637–638. Its walls were constructed under Justinian, and, Byzantine again in 969, it then in turn became a possession of the Seljuks, of the Crusaders, and of the Armenians; in 1268, it was occupied by the Mamelukes and in 1516 by the Ottomans, who found it reduced to a poor village (Antakya). Countless magnificent monuments are mentioned in the sources, both on the island (which no longer exists) in the Orontes River, where first the royal Seleucid, then the Roman imperial palace, the stadium, and the tetrapylon all stood, as well as in the city proper, where mention should be made of the three-storied theater, the Tycheum, the agora, the Church of St. Ignatius, and the Martyrium of St. Babilas. Only a few fragmentary elements of this impressive group of buildings have come to light in excavations. The general plan of the city is known only in its broad outlines: the walls, with five main gates, were built by Justinian. During the Franco-American excavations, the first test excavations were made of the stadium rebuilt by the proconsul Quintus Marcius Re and a small theater (2d century A.D.) in the famous suburb of Daphne (Harbiye). In 1933–1936, excavations were undertaken, again at Daphne, of the cruciform Martyrium of St. Babilas (381), with a sort of large central shrine, supporting a cupola; four aisles probably extended from it. A series of public baths, among which the so-called "Baths C," dating from late Roman times, extremely spacious and complex in their architectural structure, and those built on the island, attributed to the emperor Diocletian, are also worthy of note. Sporadic excavations have unearthed the remains of numerous urban and suburban villas with rich mosaic decorations; among these the Yakto complex, with polychrome mosaics, is particularly outstanding (see IX, col. 134). In the neighborhood of Antakya are the remains of two Roman aqueducts and a large necropolis known as the "Tomb of Mnemosyne." Daphne, famous for its time-honored oracle of Apollo, has yielded luxurious villas with fine mosaics. Seleucia of Pieria, probably originally intended as the Seleucid capital, is situated near the sea and in ancient times served as the port of Antioch; it preserves remains of a nymphaeum (2d century of our era), of two temples from the Hellenistic period — one, Ionic, is of marble and one, Doric, is of limestone — a polygonal *enceinte* wall (3d cent. B.C.), and an important quadrilobed martyrium with two-storied walls and a projecting apse (ca. A.D. 550–600). Worthy of note are certain engineering works (canals and dikes) built in the Flavian age and connected with the organization of the harbor system. Nearby is the necropolis for the sailors of the Roman fleet (1st–3d cent. of our era). Archaeological Museum.

Antioch in Pisidia. A city founded by Seleucus Nicator before 280 B.C. on the spot where an ancient Phrygian sanctuary had formerly stood, its ruins lie near Yalvaç in Isparta. Conquered by the Romans in 189 B.C., it became part of the tetrarchy of Galatia and in 25 B.C. was occupied by soldiers from the 5th Gallic Legion; it was visited by St. Paul (*Acts* XIII, 14–52). The city was destroyed by the Arabs, probably in A.D. 713. There are scanty remains of the *enceinte* wall and architectural elements with sculptures from the triple-arched monumental gate. There are also remains of a theater, apparently dating from Roman times, and, near the city, of a Roman aqueduct on arches; on top of the overlooking hill was a temple dedicated to Men, a local divinity connected with moon worship.

Aphrodisias (Geyre). The city was spread out along the floor of the valley of the Caria, at the foot of a hill upon which stands the acropolis. In the 2d century B.C., it seems to have been confederated with Plarasa; in 39 B.C. the community was granted freedom by Roman decree, which granted, moreover, various privileges to the sanctuary of Aphrodite. In the Roman imperial age the city enjoyed considerable prosperity, aided in large part by the production of the flourishing workshops of sculptors who worked in what was perhaps a local marble and who exported statues, architectural pieces, and even skilled craftsmen throughout the Mediterranean area. In Byzantine times Aphrodisias became Stauropolis, and at the end of the 5th century the emperor Leo I made it a metropolis of Caria. At the end of the 12th century the city was occupied by the Seljuks; it was recaptured by Manuel I Comnenus but once again fell into the hands of the Turks; then sacked by Tamerlane (1402), it gradually fell into decay until it was reduced to the present village of Geyre.

A well-preserved monument is the stadium, dating from perhaps the 1st century of our era, 746 ft. long and containing a high podium faced with large stone slabs (*orthostatoi*) and the upper ambulatory marked off on the outside by a wall of blind arches. The baths, dating from Hadrian's time, more or less cover the center of the city; they are of the standard type found in Asia Minor, with parallel barrel-vaulted rooms, a large gymnasium, and innumerable decorative sculptures. Joined to the baths by a smaller arcade was a large agora dedicated to Tiberius, with Ionic porticoes on three sides and rich decorations. To the north of the Tiberian agora there stand the remains of another immense square, in front of which stands an odeon from the 2d century of our era. At the foot of the acropolis

Aphrodisias (Geyre), archaeological plan. Principal monuments: (*a*) walls; (*b*) stadium; (*c*) 6th-century church (former temple of Aphrodite); (*d*) odeum; (*e*) baths; (*f*) theater; (*g*) church; (*h*) bishop's residence.

are the ruins of a nymphaeum and a large church, built of elements taken from ancient buildings, which occupies the site of the Ionic temple of Aphrodite, with an interesting propylon with twisted columns. There are negligible remains of a theater with a subterranean auditorium from the Claudio-Julian era; the theater seems to have also had a nymphaeum behind the *scaena*; the city walls, approximately 2 miles around, were built by Costantius II in the middle of the 4th century (ca. 349–350) and are purposely irregular; the turrets are almost completely in ruins. Recent American excavations have brought to light an almost perfectly preserved ecclesiasterion, a luxurious private house near the church, and a three-choir martyrium, especially important because of its plan.

Aspendos (Aspendus; mod. Belkisköyü). According to Greek tradition, the city, set on the banks of the Eurymedon, was founded by the Argive colonizer Mopsos in the 10th century B.C.; it seems, however, that it retained the characteristics and language of the area for a long period of time. Wealthy and active, it came to terms with Alexander the Great at the time of his expedition in Pamphylia (333 B.C.). In 190 B.C., it yielded to Rome and then formed an alliance with Pergamum. After the death of Attalus III, it was incorporated into the Roman Empire. In late Roman and Byzantine times it was prosperous, but its importance, compared to that of Side and Perge, was diminished. Repeatedly sacked by the Arabs, it was ultimately abandoned after the Moslem conquest and the inhabited district was reduced to perhaps nothing more than the theater with its stage in the form of a palace. The city stands on an elongated hill with a double acropolis on the southeast. The city walls were limited to the points of easiest access and contained four gates. At the center of the city, surrounding an agora and the remains of several-storied shops, were a nymphaeum on the north side, similar to, but smaller than, the one in Side, and a long (345 ft.) three-aisled building (a shorter fourth aisle opens onto the agora) with a vast antechamber thought to be a basilica or Caesareum; these monuments all date from the 2d century of our era. Further north are the remains of an assembly hall (odeum or bouleuterion). On the east slope of the hill is to be seen, aside from the remains of a stadium, the famous perfectly preserved theater designed by the architect Zeno (See ROMAN ART OF THE EASTERN EMPIRE, col. 293). Farther south there are the remains of two baths, the larger one built of stone blocks and the other, a mixed stone-and-brick structure with rooms of various shapes. On the same level are ruins of a massive siphon aqueduct (3d cent. of our era) and of private houses.

Beycesultan. A site located in the upper valley of the Menderes (the ancient Maeander), Beycesultan was explored by English archaeologists (1954–59). Forty different levels, divided into six main phases, have been identified. The Late Chalcolithic Age is represented by pottery finds that connect this area with the southwestern Anatolian area and the nearby Aegean islands. The original settlement was perhaps fortified (as it was to be later from the Early Bronze Age on) and contained isolated single-room houses in pressed clay. The Early Bronze Age, divided into three phases and marked by two great destructions caused by the influx of new populations, is represented by a series of shrines arranged in pairs; finds, including the "consecration horns," the steles with curved tops, the small violin-shaped idols, and the cult objects show significant connections with Asia Minor and Minoan Crete. The pottery, which suggests, among other things, close contact with the Hellespont region at the time of Troy I and II and the Yortan Group necropolises, abounds in elements deriving from metalworking techniques In the Middle Bronze Age (ca. 1900 B.C.) the great palace was built which was destroyed by fire in about 1750 (IX, FIG. 651). Timber was used abundantly in its construction and, with its courtyards, its lustration

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

areas, and living quarters on the upper floor, it offers interesting comparisons with the Minoan palaces of Crete. Unfortunately, the lack of archives or of any other sort of historical document has made it impossible to identify Beycesultan, which was perhaps the capital of the entire region, with one of the kingdoms known from Hittite tradition. The Late Bronze Age levels, though undoubtedly interesting, do not compare in richness with Middle Bronze Age culture. Only at the end of its existence does Beycesultan show distinct influences from the Anatolian highlands.

Boğazköy (anc. Hattushash). Capital of the Hittite empire starting with the reign of Hattusilis I (ca. 1550 B.C.), Boğazköy has been investigated by German archaeologists. The earliest traces of occupation, dating back to the early Bronze Age II, have been located in the lower part of the city. At the beginning of the 2d millennium it was the seat of an Assyrian commercial colony (*karum*). Destroyed by Anittas about the middle of the 18th century, it was raised to the rank of capital as a result of its strategic importance at the center of the plateau marked off by the River Halys. The citadel, Büyükkale, was the fortified acropolis, and a massive *enceinte* wall protected the inhabited area. During the 14th century, probably at the orders of Suppiluliumas, the urban area was extended southward to include the large ancient hollow surrounded by hills. Destroyed at the end of the Late Bronze Age in the upheavals that disturbed the entire Near East, it was reoccupied in Phrygian times. The Hittite monuments include five temples, the outer and inner *enceinte* walls, the acropolis, and a series of forts erected on rocky masses scattered along the slopes. The five sanctuaries, which have certain basic elements in common (the indirect access to the innermost sanctuary, or adytum, a system of illumination by means of tall narrow windows, and a central courtyard), are best exemplified by Temple I, surrounded by a series of storerooms in the form of long narrow cells, ranged about a courtyard at the center of which stands the temple proper. The outer walls of the city are the best preserved; the lower part, of crudely cut cyclopean stones, supported a superstructure (no longer extant) of mud brick; Three main gates were set into the south section: the Lion Gate had apotropaic lions facing outward, with only the front parts in the round; the Yerkapi (Gate of the Sphinxes) had two winged sphinxes with strange headdresses; and the Royal Gate had the figure of a warrior (god or sovereign) carved inside the gate proper. These are the most important known examples of Hittite sculpture. Carefully planned defense works, such as posterns, stairs, and a buttressing wall facing the open country, complete the fortifications of the Gate of the Sphinxes. In the acropolis, greatly altered in Phrygian times and already heavily damaged during the conquest of the Hittite city, all that remains of the palace are the traces of the foundation in the rock. The zone to the northwest has, however, yielded the famous archive containing more than 3,500 tablets. The disposition of the citadel, with its monumental entrance, an audience chamber sustained by 75 pillars, and other buildings whose function is difficult to ascertain, suggests the existence of a clear construction plan. Dating from the final period of the acropolis is the terra-cotta statue of the Phrygian Cybele; on either side are two musicians, one with a lyre, the other with a flute.

Bursa (anc. Prusia ad Olympium; former Brussa). The fertile plain in this area favored from earliest times the creation of an important center at the foot of Olympus. The city proper, Prusia ad Olympium, was said to have been founded by Prusias I at about the end of the 3d century B.C. In 190 B.C. it was assigned by the Romans, who had triumphed over the Seleucids, to their ally, Eumenes II, the king of Pergamum. It did not, however, assume a position of prime importance in the Roman Empire. Conquered by the Seljuks in 1075, it changed hands various times during the period of the Crusades and enjoyed a period of prestige as a center of Byzantine resistance against the Turks after the somewhat dishonorable conquest of Constantinople in 1204. Besieged at the beginning of the 14th century by the Ottoman Turks, it surrendered to Orhan on April 6, 1326. Made capital of the Ottoman Empire with the name of Bursa, the city was embellished with many handsome buildings up to the year 1413, when the capital was transferred to Edirne. The fondness of the Ottoman monarchs for the original capital of their empire, was, however, never to diminish; it was, moreover, an important crossroads, an agricultural center and a resort area; the city is large and prosperous even today. Nothing, or almost nothing, remains of the Brussa of Byzantine times. Of particular interest among its Islamic monuments is the Mosque of Orhan (begun 1304, completely rebuilt 1417), in squared stone with brick ornaments and arches. In plan, it consists of three domes in line, with a fourth dome covering the sanctuary; the entire building is preceded by a sort of inner narthex and a portico supported by pointed arches and surmounted by five small domes. The prayer hall is formed by the two large central domes, while the two lateral rooms must have been reserved for the library. The Ulu Cami, or Great Mosque, is square in plan with twelve intermediate pieces which support, by means of pointed arches, 20 domes; it was begun in 1396 and finished in 1400. At the center, under a luminous dome, is a large ablution fountain; the cedarwood mimbar dates from 1399–1400. The Muradiye Cami (Mosque of Murat II; 1424–1427), richly decorated with ceramic mosaics, follows the usual layout of the other Bursa mosques, with two minarets and three abutments in front and another, constituting the sanctuary, preceded by a portico; two minarets stand at the front of the mosque, whereas the portico, because of its polychrome coloring, stands out from the bulk of the building; inside, the walls are tiled with beautiful turquoise-blue tiles. Behind the mosque is a madrasah consisting of a courtyard circled by a gallery and rooms for the students; nearby is a cemetery containing the turbehs of eleven members of the Ottoman imperial family. The various turbehs, polygonal in plan and built of stone or brick, are richly decorated on the inside with ceramicwork (tiles). The most important one is the Türbe of Murat II, the simplest and the most beautiful of the tombs. It is rectangular in plan with a domed roof, open at the top and resting on four pillars. Also preserved at Bursa is the so-called "house of Murat II," a timber and masonry structure, recently restored. The Yeşil Cami (Green Mosque) is the most important example in Bursa of the Turkish art of this period. Begun in 1420 and finished in 1424 by Sultan Mehmet I Çelebi, it has the usual inverted-T plan; in addition, however, it has four rooms set in pairs in the wings of the main nave, as well as a narrow entrance chamber. At the center of the foremost room is a fountain with a basin. Inside there are magnificent tile facings — molded and enameled cornices in the imperial loggia, in the two loggias on the façade, and in the mihrab. It is ascribed in an inscription to one Hacı Ivaz. Also dating from 1420 is the Yeşil Medrese (Green Madrasah), now the Archaeological Museum; the lesson hall, square in plan with a domed roof resting on an octagon, projects from the perimeter of the building. The Yeşil Türbe (Green Turbeh), the tomb of Mehmet I, is an octagonal structure with a dome on pendentives and is decorated with enameled-tile mosaics; those on the outside have been lost, but the inside ones remain, all of them fine. The Eski Kaplıca, a hammam begun by Murat I, consists of a square room with a domed roof supported by columns set out in an octagon and adorned with Byzantine capitals evidently taken from other buildings. Other structures were added to it by Beyazıt II. The edifice has been altered considerably over the years. The central area of the Beyazıt I Yıldırım ("the Thunderbolt") Mosque (1390) is surmounted by a small tower with a domed roof; a portico runs along the façade, with six bays each covered by a small dome; on either side there are two round minarets. The Medrese of Beyazıt I (1394) has attached to it the earliest mental hospital of Ottoman times. The ground plan of the two buildings is practically identical. The hospital consists of rooms set around a rectangular courtyard. The roofs and domes are tiled and the wall surfaces are of stone and brick.

The present plan of Bursa, begun in the second half of the 19th century under Ahmet Vefik Paşa, based upon the opening of four wide, straight streets crossing one another at right angles, the tearing down of the old quarters and the construction of a new quarter next to the historical center, has proved utterly inadequate for modern needs. The city is presently being given a new structural organization (under the direction of the Italian architect L. Piccinato) with emphasis upon the preservation of the historical center with its typical two-story buildings and its numerous and famous parks and

Büyük Güllücek. This is a mountain site about 10 miles north of Alaca Hüyük. Excavations have brought to light a settlement from the central-Anatolian Late Chalcolithic Age, with two levels of houses; the presence of metal is certain, but specimens are rare. In general, it can be said that this was a homogeneous culture, devoid of any remarkable evolutionary aspects. The pottery is monochrome, most of it with incised decoration; the designs, in lines and dots, are intricate and extremely varied. There is also evidence of decoration consisting of white lines on a dark background; this technique has been related to similar specimens from Level-12 finds at Mersin, but the abundance of Late Chalcolithic ware from Beycesultan must not be overlooked. Other comparisons have been made with the pottery of Sakçegözü and Tilkitepe (where Tell Halaf-type culture is present), but there are similarities, especially in pot-handles, with the western coast. The chronological definition of this culture is still uncertain, but similarities have been pointed out between Büyük Gülücek pottery and that of the early levels of Alaca Hüyük. Remains from the Hittite period are scanty, whereas those dating from the Phrygian period are more substantial.

Carchemish (Karkamiş). This city on the Turko-Syrian border was excavated at various intervals on behalf of the British Museum. The site was inhabited from Chalcolithic times, as is proved by the discovery of necropolises on the outskirts of the city, but it reached its greatest prosperity in the Late Bronze and Iron ages, up until the Assyrian conquest of 717 B.C. and the destruction of the city by Nebuchadnezzar III in 604. Carchemish became, in fact, a part of the Hittite empire, but it was very soon to play an important role as the vice-regal seat of the kingdom of North Syria. The city, which has been partially excavated, consists of a necropolis on the Euphrates and a lower city with two *enceinte* walls supplied with towers and gates with inner rooms. All the monumental buildings, except for a temple on the citadel, are located in the lower city, where a temple with a temenos along the front has been identified, as well as a *bît hilani* and other related buildings. The chief characteristic is the decoration by means of sculptured slabs running along the base of the walls. There are three large architectural monuments: the so-called "Long Wall," which leads to a stairway (in its present form it represents the final stage of the reconstruction carried out by King Katuwas at the beginning of the 9th cent. B.C.); the so-called "Herald's Wall," remodeled by Katuwas and preceding the "King's Gate," to which it was connected; the so-called "King's Gate," whose final systematization was the work of King Araras (ca. 780). The iconographic motifs are varied; they include mythological and religious representations and portraits of the royal family ("King's Gate). A high artistic level is maintained throughout and, especially in the details, the assimilation of foreign elements is revealed. These three monuments, together with numerous sculptural fragments, the "Water Gate" carvings, and the statue of the god Atarluhas, constitute one of the primary sources for the documentation of 1st-millennium neo-Hittite art.

Çatal Hüyük. This is a settlement on the Konya plain in which, during investigations by J. Mellaart, ten different levels have come to light. Almost all of them, according to Mellaart, had ceased to exist as cultures during the Early Neolithic Age. The earliest levels attest to the transition from a pre-pottery stage, in which wooden dishes were used, to a pottery stage which links up with the Late Neolithic Age at Hacılar. The most important contribution made by this site to the knowledge of Anatolian neolithic times is the discovery of countless sanctuaries within the inhabited area, in which stood houses of one or more rooms set along narrow streets (Levels 1–3) and courtyards (Level 4), or grouped together to form a single block; in the latter event they were entered through the roof. The walls of the sanctuaries are decorated with paintings representing hunting scenes, human and animal figures, and geometric patterns probably taken from textiles. Heads of bulls modeled from clay and having bone horns were frequently found, either hanging on walls or set along the benches. The furnishings and decorations, many times reworked within a given period, would seem to point to complex rituals. Present in all the levels were the male (?) and female figurines (these latter often steatopygous and sometimes associated with wild animals) often rendered with a sense of realism, but at times crudely stylized. Burial was intramural. Finds of painted pottery bearing geometric patterns prove that life in the inhabited center continued on into the Early Chalcolithic Age.

Cnidus (Gr. Knidos). This was a Dorian (perhaps Laconian) colony on the Carian coast, possibly founded on an island; today it is a promontory joined to the mainland by a narrow isthmus. It was the site of a sanctuary of Aphrodite, where the celebrated statue of the goddess by Praxiteles was located. It was a part of the Dorian Hexapolis in the 7th century B.C., of the Delian League, of the Ptolemaic empire, and, lastly, of the Roman province of Asia. Both on the promontory and on the mainland, the city, encircled by walls dating from Hellenistic times and provided with three gates, was laid out in a checkerboard plan in an almost perfectly north–south direction. The acropolis was situated at the northeast end; at its foot lie the well-preserved remains of the theater and the ruins of the substructure, in polygonal construction, of the sanctuary of Aphrodite. In the southern part of the city, near the southeast and northwest ports, were located the agora, various connecting stoas, a smaller theater, an odeum, and two temples, one Ionic and the other Corinthian. All these monuments date, roughly speaking, from between the 4th and the 2d century B.C., the period of Cnidus' greatest prosperity. Of special interest, near Cnidus, is a tomb similar in type to the mausoleum at nearby Halicarnassus.

Demirci Hüyük. A small mound west of Eskişehir, this site was investigated by K. Bittel in 1937. Culturally it partook of a larger area (the so-called Sakarya group), to which Polatlı is also to be related. It represents, for the most part, an eastern extension of the Troy-Yortan culture. During its existence, the inhabited center was at one time destroyed, perhaps at the same moment as Troy II, but comparisons, as far as the material is concerned, extend up to Troy V.

Didyma (mod. Yenihisar). During the excavations made at Didyma (1906–30) by German archaeologists headed by Theodor Wiegand an archaic temple was found under the Hellenistic oracular temple of Apollo Philesios. The former temple, apparently dating from the early 6th century B.C., before Didyma was annexed to Miletus, was as renowned for its oracle as was the temple at Delphi. About the middle of the 6th century, Didyma was annexed to Miletus. The archaic construction was replaced by a large Hellenistic temple which burnt down at the beginning of the 1st century B.C. The present temple, almost all of which apparently dates from Roman times (between the reigns of Tiberius and Hadrian), was never completed; dipteral and hypaethral, it measures approximately 388 ft. × 197 ft. on the outside and had two rows of 10 Ionic columns along the short sides and two rows of 21 columns along the long sides, with a great 12-columned pronaos in antis. The entranceway, its threshold rising about 5 ft. above the ground, led into the open hall from which the oracles were uttered. Two steps led down to the adytum, the courtyard in which the Ionic tetrastyle *naiskos* stood, a structure dating from the 4th century B.C. It was connected to the port of Panormos by a sacred way four miles long (a lion and twelve sphinxes that stood along either side were removed by Charles Newton, 1860, and taken to the British Museum). A Byzantine church with baptistery was discovered in the adytum, but it was destroyed during excavations.

Divriği (Byz. Tephrike). A citadel in the district of Sivas, capital of a Seljuk principality in the 12th and 13th centuries, it became part of the Ottoman Empire in 1517. Besides the remains of buildings of little importance, there is the Ulu Cami (Great Mosque), a monument of great interest built in 1229. It consists of a double structure, both parts of which are rectangular in plan, though differently oriented; the larger one serves as a mosque, the smaller as a hospital. The prayer hall of the mosque is divided into five parallel aisles by rows of four octagonal pillars; the dome in front of the mihrab, ornamented with curious moldings, is sheathed by a segmented pointed cone. The west door is formed by archivolts which form pointed arches at the top. The hospital consists of a rectangular barrel-vaulted room with a large liwan at the far end and others along the sides, each of them flanked by two rooms. Directly opposite the large liwan and after the entranceway is a vestibule, beyond which a small flight of stairs leads up on the right to other rooms.

Diyarbakır. This, the main city of the region of the same name, was situated on the banks of the Tigris in northern Mesopotamia and was known in antiquity as Amida. It was annexed to the Roman Empire by Galerius in A.D. 297 and was fortified by the Emperor Constans (394); during the next three centuries it was the scene of almost constant battle between the Byzantines and the Arabs. It finally became a part of the Ommiad (q.v.) caliphate and later of the Abbasside (q.v.) caliphate, from which it gained its independence at the end of the 10th century. At various times it belonged to the Marwanid dynasty and to the Seljuks and in the 11th century it became the stronghold of the Ortuqids. Passing under Mongolian, Turkoman, and Persian rule, it was finally conquered for the Ottomans by Selim (1515).

The Ulu Cami, built perhaps on the site of a Byzantine church, is rectangular in plan, wider than it is long; a portal leads into a spacious courtyard with arcades on the sides and two ablution fountains, one of them octagonal with the covering supported by small columns, the other square. Northeast of the courtyard is the Masudiye Medrese, preceded by a portico. The mosque has a central nave, set at right angles to the *qibla* wall and higher than the three transverse aisles on either side. The entire building is covered with an overhanging roof on trusses. The Zincirli Medrese, dating from the 12th century (now a small archaeological museum) consists of a central courtyard, on the south side of which there is a liwan flanked by various rooms. Other Ottoman mosques of lesser importance include the Malik Ahmet Paşa Cami, dating from the end of the 15th century, and the slightly earlier Behram Paşa Cami. The walls surrounding the city were built by Constans and were enlarged and restored at various periods; remaining from Moslem times are a few reliefs on various gates and bastions, such as those on the Harput Gate (a bird with outspread wings and some walking lions) dating from perhaps the beginning of the 10th century; on one of the towers are a sphinx from Seljuk times and a figure armed with an ax from the same period. Other Seljuk carvings on the Ulu Badan bastion show a two-headed eagle and lions with human faces, similar to those on the Yedi Kardes bastion. The citadel, perhaps also dating from the 4th century, includes works from the Islamic period; the mosque of the citadel, built about the middle of the 12th century, must have undergone many alterations. The minaret, in its present form, is cylindrical and rests on a square base.

Eflatun Pınar. This site lies southwest of Konya, near Lake Beyşehir, next to a mound bearing evidences of Late Chalcolithic occupation. There is a small hollow with the pool of a large spring from which a stream flows toward the lake; on the northern bank of this stream is a construction (altar?) built of stone blocks, the front of which is adorned with sculptured figures. The central group consists of two enthroned deities (sun god and sun goddess?) surrounded by smaller figures, two of which support a large winged disk that fills the entire width of the façade. It has been described as a monument of victory raised by Tudhaliyas IV (Bittel and Naumann, 1951) and as having a religious significance (Mellaart, 1962), but according to Seton Lloyd (1956) only the character of the masonry justifies the classification of this work as Hittite. According to Mellaart, the unfinished statue at Fasillar, along with another female figure, now lost, is to be considered the crowning piece of Eflatun-Pınar structure. The work was probably erected sometime during the 13th century B.C..

Ephesus (Gr. Ephesos; mod. Selçuk). According to tradition, Ephesus was founded in the 11th century B.C. by a group of Ionian settlers headed by Androcles on a site near the mouth of the River Cayster (Küyük Menderes), at the head of the great "royal highway" into Anatolia. It was enormously important, both historically and culturally, throughout antiquity; a by no means negligible element in the immense prestige enjoyed by Ephesus was the temple dedicated to a goddess of fertility, subsequently identified with Artemis, built in the plain northeast of the city. Conquered by Cyrus after having been subject for a time to Lydia, it lay for two hundred years under the Persian yoke, except for brief intervals of independence; it regained its freedom only with the arrival of Alexander the Great. As of 278 B.C., it was reorganized by Lysimachus in accordance with a new plan, which included a vast *enceinte* wall and the putting of the harbor system into order. The city then suffered the fate of the other Ionian cities: in 196 B.C. it was conquered by Antiochos III who, upon suffering defeat at the hands of the Romans, was forced to give it to the kings of Pergamum. Bequeathed in 129 B.C. to the Romans, Ephesus became the capital of the province of Asia and, except for the interval of the Mithridatic wars, retained a position of absolute supremacy and unrivaled prestige until A.D. 263, when the Goths sacked the Temple of Artemis. Even so, during the 5th and 6th centuries, Ephesus remained the most important city of the Byzantine Empire after Constantinople. During the expansion of Christianity, the urban district and the hill overlooking the Artemision (now Selçuk) were enriched in the 5th century by several large churches; in 431 it was the scene of the ecumenical council, which was held in St. Mary's Cathedral. After the Arab incursions of 700 and 716, the city attempted to reestablish itself at the heart of the ancient urban complex, running a small *enceinte* wall around the rebuilt inhabited area. At the same time, another independent center must have sprung up in the vicinity of St. John's Basilica (II, FIG. 772), equipped with its own aqueduct; but new incursions quickly destroyed this city, so that by the time of the Crusades it was practically deserted. Local harbor activities were transferred to the Gulf of Kuşadasi, and in the vast area once occupied by Ephesus the only inhabited area was a small village, centered around St. John's Basilica, which continued to exist through the conquests of the Seljuk and Ottoman Turks down to the present day, at first under the name of Ayasouk and then under that of Selçuk. The ruins were first excavated by J. T. Wood and then by D. G. Hogarth, who explored the site of the Artemision; since 1895, systematic excavations have been undertaken by the Austrian Archaeological Institute. Perhaps the earliest settlement sprang up on the hill where the present-day village of Selçuk is located, a small height, part of it with steeply sloping sides, commanding the road between Smyrna and Anatolia. Recent excavations in the neighborhood of the Byzantine "Gate of the Persecution" have brought to light remarkable earthenware vessels from the Helladic Age. On the plain below Selçuk stood the great Temple of Artemis, of which, unfortunately, little more than the site remains. Excavations by English archaeologists have uncovered traces of its various stages: remains of the foundations of the central *naiskos*, ivories, goldwork, and pottery dating from the 8th–7th century B.C. However, important elements were found of the great temple designed by the Cretan Chersiphron and Metagenes with the help of Theodoros of Samos (560–546 B.C.), and which benefited from the generosity of Croesus, the king of Lydia. The temple apparently had 8×20 Ionic columns on the outside (9×21 according to others) and measured 370×180 ft. It was hypaethral, dipteral, and had three rows of columns along the front (a double colonnade also ran along the pronaos and in the opisthodomos); in the *sub divo* courtyard stood a small temple with the statue of the goddess. Some of the columns had reliefs on the lower part and were set on dados, also carved. The temple, which had burned down in 356 B.C., was rebuilt in Hellenistic times in the same form, with the lower part of the columns also decorated with sculptures, one of them ascribed to Skopas (q.v.).

The Hellenistic and Roman city spread over the slopes of two hills lying towards the sea, Mt. Coressus and Mt. Pion (mod. Bülbül Daği and Panayir Daği respectively); the harbor, an oval basin communicating with the sea by means of a canal, was built in the hollow between the two hills. The city limits were delineated by the Hellenistic walls, considerable portions of which are still standing. This protective fortification, which wound upward along the crest of the two hills, was built of stone blocks with square towers and was five miles in perimeter; two of the city gates, known as the Magnesia Gate and the Coressus Gate, have been identified. Ephesus, archaeological plan. (*1*) Ancient harbor; (*2*) walls dating from the time of Lysimachus; (*3*) Magnesia Gate and porticoed street; (*4*) harbor gate; (*5*) Byzantine walls; (*6*) site of the Coressus Gate; (*7*) agora and porticoed street; (*8*) porticoed square, harbor baths, and gymnasium; (*9*) Celsus Library and temple dedicated to Serapis (?); (*10*) Hellenistic temple; (*11*) site of the Temple of Hermes; (*12*) necropolises; (*13*) Temple of Domitian; (*14*) fountain; (*15*) so-called "Tomb of St. Luke"; (*16*) east gymnasium; (*17*) baths of Varius; (*18*) odeum and prytaneum; (*19*) baths of Scholastikia, temple of Hadrian, and, across the street, nymphaeum and octagon; (*20*) large theater and gymnasium; (*21*) round building; (*22*) Council church; (*23*) Byzantine baths; (*24*) stadium; (*25*) gymnasium of Vedius; (*26*) domed tomb; (*27*) Grotto of the Seven Sleepers; (*28*) cliff sanctuary with votive niches; (*29*) aqueducts; (*30*) Byzantine building. In the Selçuk area: (*31*) Church of St. John; (*32*) citadel; (*33*) Isa Bey Cami and baths; (*34*) Artemision; (*35*) museum (*from J. Keil, 1957, updated*).

level area opening onto the harbor stood the nucleus of the city, with a broad arcaded marble-paved street known as the Arcadian Way (because of restorations made in the time of Arcadius, 383–408) running alongside the public baths; a parallel street further south led to the agora. Monumental gates were set at the beginning and end of these streets, so that the Arcadian Way started at the harbor and was marked by monumental portals with Ionic columns; the street leading to the agora began at another gate of two orders. Another important street, the so-called "Marble Street," descended from the Magnesia Gate to the town center and was also lined with arcades, which underwent radical changes after the Arab destruction; the thoroughfare followed its course amidst tombs, public baths, temples, public buildings, and residential quarters along the valley between the two hills. The Hellenistic agora, a vast square covering some 524 sq. ft. and with a clepsydra in the center, had a double-aisled stoa all around and probably simple two-storied shops on three sides; the agora was connected on the east side to an outside stoa of the Doric order; the west side had a propylaeum with a double Ionic colonnade; to the south was a triple gateway, built by Mazaeus and Mithridates in honor of Augustus in the years 40–30 B.C., which gave entrance to the magnificent library erected by Julius Celsus Aquila in honor of his father, Celsus Polemeanus, Roman consul in A.D. 92. The library was a rectangular hall with a tripartite façade, adorned with two stories of colonnades, in the guise of a theatrical *frons scaenae*; it was converted in late Roman times into a nymphaeum (from which came the well-known historical reliefs of the Aurelian period); inside were three floors of bookshelves served by galleries and colonnades, as well as a large central niche with a cell beneath it containing the sarcophagus of Celsus. The imposing Temple of Serapis (2d cent. of our era) was situated west of the agora, with a barrel-vaulted cella preceded by an immense octastyle colonnade and a monumental staircase set at one end of an arcaded courtyard. Given the political position of Ephesus in the Eastern Roman Empire, the temples for the religious cult of the emperor and the works they contained assumed particular importance. The Temple of Domitian stood in the southern part of the city on an enormous substructure and had a tetrastyle *cella* with a peristasis of 8×13 columns with a freestanding altar in front; the head and one arm of the enormous statues of the emperor have also been found. The small, recently reconstructed Temple of Hadrian (XII, PL. 189) faced onto the "Marble Street" with a two-storied colonnade and a central arcade (four columns on the lower and six on the upper). Interesting carvings, partly from Hadrian's time, partly from the late Roman period, are to be seen in the pronaos. A Hermaion stood on the northwest slopes of Mt. Coressus. Among the numerous public baths of Ephesus, those dating from Roman times follow the plan typical of Asia Minor with several parallel rows of rooms, with the tepidariums aligned on the south and west sides. The largest baths (near the harbor), of truly colossal dimensions, had a triple-portico area in front (the square of Verulanus; A.D. 150–200) and consisted of a colonnaded exercise yard with two open rooms on either side leading to the rooms for bathing. The bathing rooms themselves were laid out in the usual manner, with the caldarium projected out from the neighboring rooms. The contemporaneous gymnasium of Vedius (2d cent. A.D.) conceived as a gymnasium-bath, also had an open space for exercising, surrounded by arcades and with a lavatory on one side, halls for public gatherings, dressing rooms, a swimming pool, and tepidariums. Worthy of special note is the hall of the imperial cult in the middle of the main courtyard. Other gymnasiums (*palaestrae*) of the same type were to be found in front of the theater and near the Magnesia Gate; like the gymnasium of Vedius, they all date from the 2d century. Another public bath, recently uncovered near the library, was rebuilt in the 4th century by one "Scholastikia" along the same general lines, that is with parallel rows of rooms. The theater (XII, PL. 188), of vast dimensions, is situated on the slopes of Mt. Pion, near the agora; the *skene*, consisting in Hellenistic times of a double row of rooms and a logeion in front, was changed in Roman times (2d cent. of our era) into a complex and towering *frons scaenae* with three stories of columns, niches, architraves, and a high *pulpitum*. The odeum, still well preserved, was entered from the "Marble Street"; it was built at the time of Antoninus Pius by P. Vedius Antoninus, who also commissioned the gymnasium bearing his name. The stadium, in the northern part of the city, was hollowed out of the side of Mt. Pion during the reign of Nero. The necropolises were located on the rear slope of Mt. Pion, where the remains of a tower from Hellenistic times (probably a funeral monument) have been found, consisting of a round tower of two orders, Doric and Ionic, resting on a heavily bossed dado. Dating from the Roman

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

period are a large sepulcher (the so-called Fontäne) and a nearby round colonnaded tomb, known as St. Luke's. Of particular historical and artistic interest is the magnificent Hellenistic mausoleum at Belevi (northeast of the present village of Selçuk), modeled along the lines of the Mausoleum of Halicarnassus, and perhaps built for Antiochus II, who was assassinated at Ephesus in 246 B.C.

Christian art is most impressively represented at Ephesus. Excavations of the city have unearthed the successive phases of the principal and oldest church, St. Mary's (Hagia Maria), dating from the end of the 2d century and set into a colossal columned gallery (the *Mouseion*). After the destruction by the Goths in 263, one of the outer sections was made into an atrium, the middle section into a place of worship (where the Council of 431 was held), and the remaining section, at the further end, into a bath and living quarters. At one side stands the twelve-sided baptistery, with a circular pool set inside a round domed room adorned with niches. In the 8th century, after the destructions brought about by the Arabs, two small churches were built within the perimeter of the 5th-century basilica; the more important one, of brick and vaulted, was constructed on an inscribed-cross plan. Another early Christian basilica was uncovered in the vicnity of the Magnesia Gate and a small church has come to light along the Arcadian Way, almost in front of the side entrance to the large public baths. A Christian graveyard of great interest is the Byzantine necropolis, the legendary cemetery known as the "Grotto of the Seven Sleepers." The nucleus consists of a burial place dating from Roman times, a chamber with arcosoliums carved partly out of the rock and partly constructed and roofed with a dome. Between the 5th and 6th centuries, a church, burial chamber, and rooms with arcosoliums, decorated with frescoes or mosaic pavements, were added to the fore part. The most important church of Ephesus was that, on the hill of Selçuk, dedicated to St. John and conceived as a martyrium of the Apostle. It perhaps originally consisted of a square nucleus with a dome containing the relics and four lightly colonnaded arms (only the foundations are known). In the 6th century, Justinian replaced it by an imposing vaulted cruciform structure. The nave, the two aisles, and the transept were covered with six domes; gynaecea dominated the smaller naves. In the 8th century defensive walls with a massive gate flanked by towers ("Gate of the Persecution") were built on the same hill as St. John's, at the top of which stood a castle which remained in use until the time of the Crusades.

After the Islamic occupation, an important monument of Seljuk art was built at the foot of St. John's: the Sultan Isa Bey Mosque, dating from 1375 and notable for its magnificent doorway with stalactites. Designed by a certain 'Ali of Damascus, it bears clear analogies to Syrian mosques, consisting as it does of a walled courtyard and two intersecting naves. Fourteen other mosques, an impressive turbeh, and a many-domed bath (all dating from Seljuk times) completed the splendors of the Islamic city.

Erzurum (Ar. Ars el-Rūm, "land of the Romans"). This was the Byzantine city of Theodosiopolis; it changed names many times — under the Armenians, Sassanians, Seljuks, Mongolians, and Turkomans — until it became a part of the Ottoman Empire in 1515. The important remaining monuments date from the Seljuk period, except for an Ottoman mosque which some have attributed to Sinān. The Çifte Minare Medrese (double-minaret madrasah), or Hatuniye Medrese, which today houses a small museum, was built in 1235 by Hatun, the daughter of Alaeddin Kaykubad. It consists of a rectangular courtyard surrounded by two levels of arches; at the center of each side is a liwan which cuts through to the top of the upper story. A round turbeh, with a conical roof and blind arches around the body of the building, is located behind the further liwan on the long side; in front, there is a portal decorated with stalactites and flanked by two minarets. The Ulu Cami also dates from Seljuk times, like the group of turbehs with conical roofs situated behind it. It has seven bays and is severely geometrical in aspect.

Gavurkalesi ("Fortress of the Infidels"). The site, situated 35 miles southeast of Ankara, contains the remains of a cyclopean wall in which basalt was introduced and, in the enclosed space, a burial chamber with an imitation vaulted ceiling. Toward the south the terrace is sustained by a wall of natural rock into which was carved a relief showing two Hittite gods approaching a seated goddess. The connection between this scene and the burial chamber would seem unquestionable. The sanctuary was completed by an entrance road set on terracing walls and a monumental flight of stairs. These remains have also been attributed to the Phrygian period, in which case they would amount to a true *enceinte* wall.

Gordium (Gr. Gordion; mod. Yassihöyük). The site of Gordium is located a short distance from the modern town of Polatlı, west of Ankara. In 1889 the Körte brothers sank two test probes in the hill where the city was presumably located and explored several of the numerous mounds scattered over the Sakarya valley. One of them, an immense tumulus over 150 ft. high, was the so-called "Tomb of Midas." Since 1949, excavation has been carried out by a team from the University of Pennsylvania which explored mainly the city area. On the basis of preliminary reports, certain conclusions may be drawn. The earliest traces of occupation seem to date from the Early Bronze Age. During the Middle and Late Bronze Ages, a necropolis (located between mounds H and I) was laid out; nonstratified material from the Hittite period has also come to light in the urban area. The most interesting excavations were undertaken in the neighborhood of the city gate, which underwent three radical transformations. The original gate may be dated from before the 8th century and, for the moment, it is the most important ruin of the earliest Phrygian period. Subsequently there took its place the great 8th–7th century gate, still preserved up to a height of 26 ft., with a paved area with a series of buildings facing onto it. Beween the invasion of the Cimmerians and the Persian occupation, the royal seat was very likely transferred to some nearby spot, probably just outside the destroyed city. In Persian times, the city gate was filled in and a layer of earth thrown over the entire area to create a uniform terracing. The last reconstruction of the gate follows more or less the same architectural plan. Though largely rebuilt after the destruction of 684, the city apparently followed, to a certain extent, the lines of the preexistent living area. Inside the gate was a square with numerous buildings and an altar for fire worship. In Hellenistic times the city lost stature and eventually became a farming village with perhaps a few workshops of an artisan nature. The excavation of several by no means humble tombs raises the suspicion, however, that there is still a great deal to be discovered in this respect. The remains of a Galatian village date from slightly before the site was abandoned; by about 200 B.C. Gordium was practically deserted. Signs of occupation in Roman imperial times were found in only one part of the urban area. The tumuli, artificial mounds of earth used to hide the tombs, are numerous; the Körte brothers excavated five of them and more than a dozen have been explored by American archaeologists. The tombs have yielded a rich abundance of material and in addition to such relatively imperishable objects as bronzes, numerous wooden furnishings have come to light. In the 7th century and later the interred body was protected by a wooden chamber, whereas in the 6th century cremation on individual pyres was used. Both methods have been found in the graves of the lower classes.

Göreme, Valley of. In the province of Nevşehir, near Urgüp, is a complex of rock monasteries, very likely the ancient Korama mentioned in the records of St. Hieronymus. The valley is strewn with pyramids and cones of volcanic tufa that achieved their strange forms through the action of erosion caused by wind and water. These cones were probably inhabited by ascetics during the early centuries of Christianity, and they certainly formed a sort of monastic stronghold during the time of the Arab invasions between the 8th and 11th centuries. Abandoned after the Turkish conquest, they were used, and in part are still used, by the local inhabitants as storerooms and pigeon-lofts. There are also architectonic structures — churches, chapels, funeral chapels, refectories, dormitories, cells — hewn out of the rock and adorned with façades with two or three orders of blind horseshoe-shaped arches; the inner rooms sometimes have a large mosaic cross stretching over the entire surface of the flat ceiling and friezes set into the upper walls. There are, too, rooms with barrel and hemispherical vaults, also carved out of the rock (i.e., the monastery adjoining the Karanlık Kilise). There are innumerable churches and chapels, and they have been only partly explored; the early stages are difficult to date with any certainty. Various plans were utilized, the most common being that with a barrel-vaulted nave and one or three apses; less common, but by no means rare, are free-cross and inscribed-cross churches with a central dome and small domes at the corners (St. Barbara; II, PL. 433). The horseshoe arch prevails everywhere. The earliest decorations, aniconic in character (crosses and geometric designs painted in red), probably date from the Iconoclast period (8th cent.). The aniconic paintings were later covered by layers of figured paintings whose subject matter was very frequently taken from the apocrypha. The largest and most important of the churches, Tokalı Kilise, has a narthex, a transverse nave with a ribbed barrel vault carved out of the rock, and three horseshoe-shaped apses opening onto a narrow corridor parallel to the nave and connected to it by means of archways; the many paintings date from the time of Nicephorus Phocas (963–67). Tokalı Kilise is surrounded by chapels at different levels. Notable among these is the Chapel of St. George, decorated with scenes from the life of the saint. Other churches with frescoes include Saklı Kilise, Karanlık Kilise, and Elmali Kilise.

Hacılar. A site in the vilayet of Burdur, Hacılar was excavated by J. Mellaart between 1955 and 1960. Seven city levels have come to light, in which no pottery but many marble vessels were found. Of particular interest is the evidence of skull worship (as was also found in Palestine, Natufian era). After an interruption, the duration of which is, for the moment, impossible to estimate, there is a sequence of nine levels which take the city from the Late Stone Age to the Early Chalcolithic Age. The Stone Age pottery is monochrome, but at the end of the period — contemporary with Mersin XXVI — decorations consisting of geometric designs against a light background began to appear and this new style was to be characteristic from that time until the site was abandoned; dark red lozenges, zig-zags, and broken-line triangles, all against a cream-colored background, commonly adorn vessels that are almost rectangular in shape. On Level I the decoration is airier and less heavy; the technique of painting the usual geometric patterns in white on a dark ground also appears. Of considerable interest are various examples of anthropomorphic vessels. Also interesting are a series of female figurines, often steatopygous, which testify to the existence of some sort of fertility cult; set in various poses and sometimes associated with wild animals, they were common in the Late Neolithic Age; in the Early Chalcolithic Age, only the standing type survived. On Level II, the houses, consisting mostly of two rooms and a shrine, are grouped together into a single large rectangular block. Level I is characterized by a fortress proper which encircled the summit of the hill, leaving a large open space in the middle. According to Mellaart, the dates, based in part on carbon 14 tests and excluding the pre-pottery period, are as follows: Late Neolithic (Levels IX–VI), 5600–5400 (with destructions); Early Chalcolithic (Levels V–I), 5400–4800/4750. It is to be noted that the Level I fortress and the pottery painted in the new style are apparently to be ascribed to an influx of new populations.

Halicarnassus (Gr. Halikarnassos; mod. Bodrum). A Dorian colony on the Carian coast, Halicarnassus in the 6th century became subject to Persia; under the hegemony of Athens in the 5th century, it subsequently became the capital of a Persian satrapy administered, however, by pro-Hellenic satraps. Conquered by Alexander the Great, it became a possession of the Ptolemies, of Rhodes, and lastly of Rome as a part of the province of Asia. The archaic and classical city possibly extended over the two promontories which enclose the small bay; a temple of Apollo perhaps stood on the promontory known as "St. Peter's," originally an island. The Hellenistic and Roman city was laid out on a slope which ended in a deep inlet. Above was the acropolis with a temple of Ares at the center, a temple of Hermes and Aphrodite on the right, and the palace of the satrap Mausolus on the left; farther down, in the center and next to a road, was the renowned mausoleum, the burial place of Mausolus; at the bottom, by the harbor, was the agora. Of all the ancient monuments, there remain only the ruins of the massive, polygonal and (on the west side) isodomic walls (4th cent. B.C.), the foundations and part of the decorations of the mausoleum (III, PLS. 377, 378), the foundations of the Ionic temple of Ares, various elements of a Doric stoa dating from Ptolemaic times, a building thought to be a shrine of Demeter and Kore, and scanty remains of a theater. The archaic and classical necropolises lie at the heart of the city of Mausolus, whereas the Hellenistic and Roman ones, with underground tombs, are situated outside the walls to the north and west of the city. An interesting late Roman house west of the mausoleum is richly adorned with mosaics and marbles (4th–5th cent. A.D.). Outstanding among the monuments of the medieval and modern city (Bodrum) are a Byzantine monastery, in ruins (Hagia Marina), and St. Peter's Castle, built in 1402 by the Knights Hospitalers, who occupied it until 1523.

Heraclea of Latmos (mod. Kapı Kırık Yaylasi). The city, of Carian origin, stood on the slopes of Mount Latmos, which at that time descended into the Aegean (later, the body of water known as Bafa Lake was formed). Conquered by the Ionians during the 11th-century migrations, it took part in the Ionian revolt and was subsequently conquered by Alexander the Great. It was for a short period of time the capital, under the name of Plistarcheia, of an independent kingdom ruled by the brother of Cassander (350?–297 B.C.), Plistarch. Particularly prosperous in Roman times, it continued to be so under the Byzantines, but the Turkish occupation marked the beginning of its decline, Of the greatest importance are the excellently preserved Hellenistic fortifications installed around the plains and heights of the city proper as well as on the two hills (north and east of the city) which served, to all intents and purposes, as bastions for controlling the road. The *enceinte* wall, consisting of a double curtain of stone blocks filled in with boulder chips, was some 4½ miles around and included numerous gates and posterns, two-storied square towers of various sizes and a sentry walk with arrow slits. Dating from a later period, though still Hellenistic, is the retrenchment of the east wall by means of a cross wall fitted with semicircular towers. Remaining of the city are the ruins of the colonnaded agora, a temple of Athena, a bouleuterion, and the theater. There are many remains, however, of buildings from the Byzantine period, such as monasteries, rock-cut churches and chapels on the Lake Bafa islands.

Hierapolis (mod. Pamukkale). Founded perhaps by the Seleucids around the hot springs which constituted the characteristic feature of the site (described at length by ancient geographers) and which were probably the center of some ancient sanctuary, this city was closely linked to Laodicea, primarily because, like Laodicea, it was a wool producer. After a considerable period of prosperity under Roman rule and following the various Arab invasions in Byzantine times, the city, already seriously diminished, was destroyed in the 12th century, perhaps by the Seljuk Turks; by the time of the Third Crusade it had been completely abandoned. Very little remains of the Hellenistic city. In the second half of the 1st century A.D., Hierapolis was enlarged along its main axis; to the north new residential districts were built on either side of the main street, along an uninterrupted front, covering part of the former necropolises, and a monumental gate, known as the Frontinus Gate, was erected (A.D. 80) at the edge of the new city. Dating from the 4th–5th century of the Christian Era are the *enceinte* walls, built of rubble, which eliminated entire quarters to the north and south from the fortified inhabited area. The urban center is very difficult to distinguish, because it is covered with heavy lime deposits; to be found there are two large, well-preserved nymphaeums; one, restored, has a rectangular base surrounded on three sides by a niched wall, projecting columns, well-preserved tympanums and reliefs, and the other (2d cent. A.D.), near the north Byzantine gate (largely destroyed), has colonnades jutting from a smooth wall finishing at either end in two small projecting sections. There are also two groups of baths, one of them, imposing and well-preserved, with parallel rooms and a gymnasium (2d cent. A.D.) and the other (converted into a church, 5th cent.) with a caldarium of three large archways (3d cent. A.D.), and a theater from the 2d century (the late Hellenistic theater, north of the necropolis, was soon abandoned and dismantled), excellently preserved, set against the side of the hill and equipped with a *frons scaenae* composed of various orders of columns. In 1963 the remains of the Temple of Apollo were excavated in the neighborhood of the Plutonion, the famous sanctuary of the Gallic priests. The city numbered three necropolises and hundreds of tombs, perhaps the largest known group in all of classical antiquity, representing all the various types; most of them are very well preserved. The Christian monuments are of great importance; a large martyrium (early 5th cent.), built in honor of St. Philip, has an octagonal nucleus 67 ft. in diameter, with a wooden-frame dome sheathed in lead and eight radiating chapels separated by arches and columns from the central area, which was enclosed on the outside by four wings set at right angles, each with a central door and portico. A church set into the baths lying outside the city walls (early 5th cent.) is a massive structure covered perhaps by three axial domes; a basilica in the town center with brick vaults resting on arches and a dome, lacking gynaecea, and with thick masonry pillars, dates from Justinian's time. The excavations of the city are the work of Italian archaeologists, active since 1957, under the direction of P. Verzone.

Hierapolis, archaeological plan (the modern village indicated in hatched lines). Principal Hellenistic, Roman and Byzantine monuments: (*a*) walls; (*b*) Frontinus Gate, main street; (*c*) Byzantine gate and nymphaeum; (*d*) patrician tomb; (*e*) Domitian quarter and supposed civil basilica; (*f*) Early Christian basilica; (*g*) baths; (*h*) Antonine theater; (*i*) nymphaeum and Temple of Apollo; (*j*) lower urban basilica; (*k*) Byzantine gate; (*l*) bridge; (*m*) necropolises; (*n*) Early Christian basilica; (*o*) remains of late Hellenistic theater; (*p*) martyrium; (*q*) gate at the southeast end of the main street (*from C. Humann, C. Cichorius, W. Judeich, and Fr. Winter, updated*).

Horoztepe. This is a small village in the vilayet of Tokat, explored in 1957. Several test probes in the inhabited area have yielded material datable from the Central-Anatolian Chalcolithic Age and from the Early Bronze Age. The pottery of the earliest period is related to that of the Samsun region and of the area included in the Kızıl Irmak crescent. The more recent pottery, however, bears close comparison to both Dundartepe and Alaca Hüyük. Distinct levels of habitation have been impossible to identify because of changes in the terrain. Extremely rich in its yield was the sounding effected in the modern cemetery, where Turkish archaeologists unearthed two Early Bronze Age tombs. One of them was intact and its grave furnishings consisted of numerous metal and pottery vessels and a series of cult objects ("standards," disks, castenets, systrums). There were also discovered a statuette of a woman nursing a baby, quite realistically rendered, with white paste eyes and black pupils; several figurines of bulls, their muzzles of yellow amber; pieces of wooden furniture with metal trimmings; two gold double-spiral earrings, a silver scepter, and numerous weapons. The similarities to the royal tombs of Alaca Hüyük are distinct; the Turkish excavator felt an authentic *Kulturkreis* could be delineated in the Tokat-Amasya district, more or less independent of Sumer, the Caucasus, and North Syria and slightly more recent (about 2100 B.C.) than Alaca Hüyük.

Iasos (anc. Iasus). This Carian city, founded by the Argives on the shores of the Gulf of Bargylia, took part in the Ionian revolt and became a member of the Delian League. Destroyed in 405 B.C. by Lysander, it was rebuilt and absorbed into the kingdom of Mausolus. Declared a free city by Rome (168 B.C.), it was incorporated (129 B.C.) into the province of Asia and led a modest existence throughout the imperial and Byzantine periods. The location of the city before the 4th century B.C. is still uncertain; among the remains of the late-classical and Hellenistic city are large stretches of the isodomic walls with semicircular towers, a gate, and numerous posterns (4th cent. B.C.), notable remains of the 4th-century theater

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

(which was, however, heavily restored and enlarged in Roman times), and a series of ruins, identified by C. Texier as a palace, a stadium, and a stoa. North of the city are the arches of an aqueduct that terminate in a building which is known as the "fish market" but which was probably a funerary monument. All around the city are the necropolises containing tombs of various types, among them a Roman tomb of particular importance. An Italian archaeological expedition (headed by D. Levi), active since 1960, has uncovered necropolises of successive eras, from an early Cycladic one to the Roman period (rich late-4th-cent. goldwork was discovered in a Greek tomb), a city quarter near the Greek theater, a gate in the walls, and a boundary inscription of a temple of Zeus Megistos. The castle at the center of the inhabited district on the peninsula is medieval.

Isaura Vetus. This important Isaurian city was situated on top of a plateau with steep, broken cliffs. The Isaurians, against whom the Pergamenes had fought in vain, were vanquished only by Publius Servilius in 75 B.C. and Isaura was shortly after placed under the dominion of Aminta (35–25 B.C.), a client-king of Rome. After Aminta's death the city became definitively subject to Rome. The double walls, still in a state of excellent preservation, were probably built by King Aminta and include the remains of two gates and 13 towers; at one end of these fortifications is a later wall which marks the limits of the citadel. The ruins of the city include the remains of a basilica and three tributary arches: one, simple in structure and devoid of columns, dedicated to Hadrian, a second, similar one, dedicated to Marcus Aurelius, and a third to Alexander Severus. There are also numerous Christian monuments, all of them dating from the 5th and 6th centuries: an octagonal martyrium with apses, the main church with a single nave, and, located in the suburbs, though still within the city walls, four other small churches. Outside the city stand the Hellenistic-Roman necropolises, with interesting rock-cut façades.

İvriz. This is a cliff carving south of Nigde, near a stream in the Taurus mountains. It represents King Urpalla of Tyana (known to have paid tribute to Tiglathpileser III of Assyria in 738 B.C.) in adoration before the god Tarhundas. The figure of the god is about 13½ ft. high. Whereas the robes and headdress of the divinity show characteristics to be found in the Hittite art of the imperial period, the King is distinguished by the Assyrian cast of his features. R. D. Barnett considers it an archaic Phrygian work. According to Frankfort, although the work possesses elements derived from the art of the neo-Hittite and Assyrian reigns, it does not pertain to either. Akurgal believes it to be a work executed by Aramaean elements which prevailed among the subject Luvian-Hittite people; this would explain the inscription in hieroglyphic Hittite.

Karahüyük (near Elbistan). This mound was excavated in 1947 by the Turkish archaeologists T. and N. Özgüç. Three phases, consisting of six inhabited levels, have come to light. The latest phase dates from the Roman period (1st–3d cent. A.D.). Pottery includes the so-called "terra sigillata" ware and other types as well, which on the highlands have been identified as Hellenistic. The middle phase, described as post-Hittite by the excavators, consists of four levels of habitations with houses built of unbaked brick and isolated on stone foundations. Tombs were found inside the houses containing bodies in contracted positions, a practice followed among the earliest Anatolian populations. Another detail which distinguished Karahüyük from the Phrygian area was the use of pottery decorated with geometric patterns, which appears for the first time only in the second level of this phase. Moreover, 2d-millennium types continue to appear in the monochrome earthenware. The most important discovery was undoubtedly that of the Level II stele, inscribed on three sides in Hittite hieroglyphics, whose sacred character was apparent from the respect with which it was regarded in subsequent periods (during which the area around it was kept free of buildings). In front of the stele was a repository hewn out of a block of stone. The earliest period uncovered during excavations has been described as Hittite. Only one level of habitation was located; there were, moreover, no buildings of a monumental character. The material culture is similar to that of central Anatolia; note should be made of the presence of imports from northern Syria and of decorated pottery, of the kind known as "Cappadocian" as well as that typical of the Bronze Age. It is likely that the period in question is more complex than appears from the series of excavations carried out in a limited area of the hill.

Bibliog. T. and N. Özgüç, Ausgrabungen in Karahöyük: 1947, Ankara, 1949.

Karaman (anc. Laranda). Situated in the province of Konya, perhaps on the site of the Hittite city of Landa, the city took its name from the Turkoman Karamanoğlu beys, who, following the downfall of the Seljuks, ruled it until the 15th century, when it became a part of the Ottoman Empire. Those monuments, extremely damaged, remaining from the time of the beys include: the Akçasar Mosque, which had, parallel to the *qibla* wall, four aisles, the first narrower than the others, and a portico along the front; the Davgandos Mosque, which consisted of a single square room with a domed roof and, along the front, a portico of three bays covered by an equal number of small cupolas. The Hatuniye Medrese (1382), designed by the architect Lokman Bin Hoca Ahmet, consisted of a courtyard surrounded by colonnaded porticoes and of various halls covered by domes. The lower half of the stalactite doorway is of marble.

Karatepe (Asitawanda). Situated about 50 miles northeast of Adana, this was the headquarters of Asitawandas, who was at first vassal to the king of the Danunians and then lord of the Adana plain. The building of the citadel covered a rather short period of time and it was very soon to be abandoned as the result of an enemy attack in the second half of the 8th century B.C. The walls of the fortress, with a circumference of about 1,245×575 ft., were built of massive stone blocks, some 13 ft. thick, with battlemented towers jutting out at regular intervals. The two main gates were designed with a right-angle entryway and an inside room. The remains of the palace, at the top of the hill, include a spacious central courtyard with rooms around the sides. The exceptional interest of this site consists in the fact that set along the walls of the two city gates were several series of dados decorated with varied designs, and two inscriptions, one in Phoenician and the other in Hittite hieroglyphics. By comparing these two almost identical texts it has been possible to verify the accuracy of what is known about Hittite hieroglyphics and to penetrate further into their interpretation. The sculptural decoration, which includes orthostats and statues, is interesting not so much for its execution as for its widely varied iconographic content. The works of at least two different schools, operating contemporaneously, have been detected, related more to neo-Hittite art (especially Zincirli) than to supposed Assyrian and Phoenician influence. Another *enceinte* wall, more carved orthostats, and fragmentary statues have been unearthed in the nearby mound of Domuztepe.

Kayseri (anc. Caesarea). Kayseri, the ancient Caesarea, lies at the foot of Mt. Argus, which towers above the Cappadocian plain. Its importance derived from its position as a strong point on the roads between Anatolia and Cilicia-Syria. Procopius described it as "a great city since ancient times." After the defeat of Valerian (260 B.C.) at Urfa it was sacked by the Persians, but it soon recovered. In the 4th century it became an important Christian center, boasting the presence of both St. Basil and the Christian historian Bishop Eusebius. In the 6th century, during the Byzantine period, the city became a military base against the Arabs, who took it time and again but were unable to hold it. Only the Seljuk Turks succeeded in conquering it permanently (1082), except for perhaps a brief period of occupation by the Crusaders. Under the Konya sultans, Kayseri became a city of exceptional importance. Occupied by the Mongols (1241), it finally passed (end of 14th cent.) into the hands of the Ottomans

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

who, however, consolidated their dominion over it only in 1515. Several years ago, in the confused structure of the city, it was still possible to distinguish the ancient walls, laid out in a roughly hexagonal plan, dating in part from an earlier period (two sides) and in part from Seljuk times, with a turreted castle on one side and a large protruding bastion. The earlier sections, possibly classical, had smooth revetments on the outside, with two tiers of arches inside and gal-

Kayseri, plan of the central area. Principal monuments: (*a*) citadel; (*b*) Huant Cami and Medrese (Museum); (*c*) turbeh and Han Cami; (*d*) Döner Kümbet and Sırçalı Kümbet; (*e*) Hatuniye Medrese; (*f*) Boyalı Kapısı (gate); (*g*) Ulu Cami and *bedesten*; (*h*) Külük Cami; (*i*) Kurşunlu Cami; (*j*) Çifte Medrese; (*k*) Haci Kılıç Cami; (*l*) Sahibiye Medrese; (*m*) Lala Paşa Cami.

leries for the defenders. The other walls (and probably the citadel as well) were rebuilt in Seljuk times (ca. 1220), as indicated by an inscription. The citadel was protected by double *enceinte* walls; the inner wall, almost 10 ft. thick, was provided with high towers, the outer one was low, with only a few towers. All that remains of the Roman monuments of the city is the base of a tomb; and from Byzantine times there are only the scattered remains of a church.

The Seljuk monuments are, however, both numerous and rich, since Kayseri in the 13th century was, after Konya, the second most important city of the Sultanate of Rum. The oldest mosque is probably the Ulu Cami (1140), dating from the time of the Danişmendids. It has four rows of pillars of various shapes; the dome in front of the mihrab is original, but the central dome is modern. It has a minaret in the form of a round tower, the upper part of which dates from Ottoman times. In the Külük Cami, built in 1210–11, the stalactite doorway anticipates the others of the Kayseri school, but it is relatively simple. On the inside, the mihrab is decorated with a magnificent square frame of stucco with greenish-blue and purplish-black ceramic tiles. The other important mosques all have similar façades of stone with stalactite doorways and rich frames minutely inlaid with geometric patterns; they represent, together with the madrasahs and turbehs, the largest, most homogeneous, and richest body of Seljuk art in Turkey. The Princess Hand Hatun foundation includes a mosque (1237–38) connected to a hospice, the madrasah, and the turbeh of the princess, built at a later date. The mosque is covered by a system of barrel vaults with an open space at the center and a dome in front of the mihrab; two rich doorways adorn the façade. The madrasah, also provided with a handsome doorway, has a single liwan, two lateral halls and a series of rooms served by a portico. The turbeh is octagonal, and it too is lavishly ornamented. The Sahibiye Medrese, dating from 1267, with a large doorway similar in type to the others, has two small towers set at either corner of the façade. The courtyard has a central liwan, flanked by two rooms, and two smaller liwans on two of the other sides. The Haci Kılıç Cami with attached madrasah (1275) has a single façade, with small round towers at either corner containing the twin doorways to the mosque and madrasah. The mosque has five aisles with a dome in front of the mihrab; the madrasah, as it stands today, retains little of the original structure. The Seljuk turbehs of Kayseri are both numerous and important. The richest and most interesting is the Döner Kümbet Türbe, a dodecagonal structure with delicate blind arcading decorated with geometrical patterns and arabesques, variegated with palms and lions in relief. The conical roof is also adorned with a pattern of arches, etched in delicate relief on the surface. The Sırçalı Kümbet (the Faïence Tower) is round in shape. The Sifaye Medrese (1206) is an ancient hospital with a medical school attached, interesting in plan though ruined. Kayseri also possesses an important Ottoman mosque, the Kurşunlu Cami (1585). Attributed by some to Sinān, it is square in plan, with a dome and a portico along the front.

Klaros. A site on the gulf of Ephesus, near the ancient city of Kolophon, this city was well known in antiquity for its oracle of Apollo. Its period of greatest prosperity, however, dates from Hellenistic-Roman times, when famous public figures (among them, Germanicus) came to consult the oracle. The sanctuary was entered through large propylaeums (2d cent. B.C.); these were followed by a double-aisled portico that has been only partially investigated. There was a marble altar of monumental proportions standing in front of the temple, a peripteral structure of 6 × 11 Doric columns (4th–3d cent. B.C.), with a series of underground corridors leading to the adytum where the oracles were pronounced. Parts of the great statue of the god have recently been discovered. Farther north, the remains of an Ionic temple (perhaps of Artemis) were discovered. The sanctuary was excavated by a French archaeological expedition (headed by L. Robert).

Lissi, EAA, s.v. (bibliog.).

Konya (anc. Iconium). The city, already inhabited in the 3d millennium B.C., belonged to the Seleucids, then to the kings of Pergamum, and ultimately became subject to the Romans, who later made it a colonia (Augustus Iconiensium Claudiconium and Colonia Aelia Adriana). It was occupied by the Seljuks (ca. 1087) and at the end of the 11th century became the capital of the Sultanate of Rum; it remained so, except for a brief interruption, until the middle of the 13th century. This was the period in which the Islamic city enjoyed its greatest prosperity, and when it also took on religious importance, beginning in the first half of the 13th century, as the headquarters of the dervishes. Nothing remains *in situ* of the classical and Byzantine Iconium; the Seljuk monuments, however, are of the greatest importance. The great Alaeddin Cami was completed by Alaeddin Kaykubad in 1220 (inscription on the façade). According to another epigraph, it was designed by Mehmet ben

Havlan of Damascus. The monument, in fact, is Syrian in style and most of the columns were taken from earlier Christian monuments. The mihrab is of stucco and varicolored marbles; the mimbar dates from 1156. One of the domes is decorated with glazed tiles, and one of the two turbehs was also built by Alaeddin. The mosque stood near a palace (built 1220 by Alaeddin), one side of which is surmounted by a gallery in which columns taken from Christian monuments were used. The city gate, decorated with carvings of djinns, was also razed to the ground (drawings by de Laborde, 1838, and Texier, 1849, remain). Next to the ancient walls of the citadel is a small but interesting Seljuk structure, the Ince Minare Cami (Slender Minaret Mosque) built in 1262. All that remains of the minaret is the base, ornamented with colored tiles. In plan, the mosque (actually a mosque-madrasah) consists of a large, square central hall, domed and with a niche for the mihrab and two lateral rooms with small domes; the large central hall is flanked on either side by four small rooms. The building was used primarily as a school. The façade is decorated with stone bands in an interwoven pattern ornamented with arabesques and inscriptions; the name of the architect, Keluk ben Abdullah, is also to be read there. The outer covering of the dome, possibly of wood and lead, has been lost. The Sırçalı Medrese (School of Ceramics, 1243) consists of a courtyard with rooms for the students facing onto it; it has a richly ornamented doorway with lateral niches. Across from the entrance, inside the courtyard, is the liwan, covered by a pointed barrel vault; the intrados of this vault is decorated with rich ceramics in an interwoven-band motif. The name of the artist, Mehmet of Tus, also appears in the vault. The Büyük Karatay Medrese (built 1251 by Mir Celaleddin) has a doorway in the form of a pointed arch, which is surrounded by small interlaced arches in *opus sectile* marble, and framed by ornamental bands and a rich inscription above. Various rows of stalactites hang down over the top of the small entranceway and two small spiral columns stand on either side; in the tympanum three medallions in the form of perforated half-spheres project from the wall. Set symmetrically at either side are two fountains in which the motif of the large doorway is repeated. Inside the mosque, which faced onto the inner courtyard, the mihrab, ornamented with colored tiles, is worthy of note. The mausoleum of Sahip Ata, which is next to it, also has an interior decorated with tiles. The Tekke of Mevlâna, the ancient convent of the Whirling Dervishes (now an Islamic museum) is a remarkable architectural complex. The earliest building is the cylindrical mausoleum of the founder (1295), with a typical domed roof surmounted by a cone, gadrooned on the exterior with green tiles. The Sahip Ata Cami (1262–83) was designed, according to an inscription, by Keluk, the son of Abdullah. The central hall of the madrasah is covered by a dome set on a 24-sided polygon. The dome is decorated with colored ceramic tiles, which are spread over the double-curved surface in a star pattern.

Korigos (anc. Corycus, Korykos). This city of Cilicia Trachea had already assumed a certain importance in Roman times. Cicero and Pliny, for example, both mention it, but in Byzantine times (also because it was protected by the peninsula and by the island which stood in front of the harbor) it grew considerably in size and enjoyed a further period of prosperity (1199–1221) as a city of Armenia Minor. The medieval city boasts of four churches; the fortress, set on a sort of peninsula, contains structures dating from the Crusades and a Roman gate. Two of the four churches are of great interest in terms of the history of art; they were laid out on an axis outside the walls and connected by a street with tetrapyle which continued on through the necropolis and along the valley all the way to the sea. The first church is square in plan with three apses and an inner structure of three columned aisles. The other is a basilica with nave, two side aisles, and a transept; each has a portico in front. A third church, dating from the Early Christian period, formed part of a small monastery; the fourth dates from the period of Armenia Minor. The necropolis abounds in pagan and Christian sarcophagi and small tombs. The island facing Korigos is occupied by an Armenian fortress (ca. late 11th cent.).

Kültepe (anc. Kanesh). Excavations by Turkish archaeologists were begun in 1948. The existence of a city, Kanesh (or according to others, Neša), already inhabited in the Early Bronze Age II, has been determined. Monumental buildings, palaces and temples were found on numerous levels. The city was destroyed, together with the Assyrian commercial colony (*karum*), about 1900 B.C., but its monumental character, which seems to foreshadow the buildings of Hattushash, remained. A palace, which is perhaps to be attributed to Anittas, and a temple, both of them remarkable in structure, should be mentioned. A fortification with square towers dates from the Phrygian period, and continued in use down to Roman times. The *karum* was situated next to the city, which was apparently the seat of some local potentate. The activities of these Assyrian colonies are known in detail through the thousands of cuneiform tablets discovered in the private archives of the various merchants; the merchandise which passed through the city was subjected to a state tax. Four archaeological levels have been determined: Levels II and IB, which apparently suffered violent destruction, represent the period when the merchants were active. Fortifications around the commercial quarters have not been discovered, nor the various public buildings mentioned in the texts. The period of activity of the Assyrian traders — with whom local merchants were also associated — may be said to have covered the period from about 2000 to 1800 B.C.

Kusura (former Akroenus). W. Lamb excavated (1935–37) this settlement (near Afyon), which existed from the Early to the Late Bronze Age. Material was found related both to the highlands and to the Aegean coast. During the Late Bronze Age, however, the area underwent considerable influence from the material culture of the Hittites: among other things, the city had double-chamber walls, as at Boğazköy and Alişar. The earliest levels date from Early Bronze Age I and II (the same culture spread over various phases). About 2300, this, like other Anatolian sites, was involved in the well-known devastations which swept the highlands and the western coasts at the end of the Early Bronze Age II and which some scholars identify with the passage of the Luwians. After a transitional period, the Late Bronze Age shows, as has been said, a distinct propensity, for a way of life characteristic of the inland and Hittite areas. Mention should be made of the necropolis with *pithos* and stone coffin-tombs.

Bibliog. W. Lamb, Excavations at Kusura . . . , AAnz, 1936, cols. 406–11; W. Lamb, Excavations at Kusura, Archaeologia, LXXXVI, 1937, pp. 1–64, LXXXVII, 1938, pp. 217–73.

Lagina (near mod. Yatağan). This was a Carian site a few miles from the ancient city of Stratonikeia, where (perhaps in the last decades of the 2d cent. B.C.) a famous temple of Hecate, the goddess of the underworld, was located. The temple, of which few ruins remain *in situ*, was pseudodipteral with 8×11 Corinthian columns, a cella without opisthodomos, and, along the front, two Ionic columns set between exceptionally deep antae. The frieze (removed to Istanbul, Archaeol. Mus.) contains representations of myths bearing reference to Stratonikea and the goddess Hecate (VII, PL. 187).

Bibliog. A. Chamonard, Les sculptures de la frise du temple d'Hécate à Lagina, BCH, XIX, 1895, pp. 235–62; A. Schober, Der Fries des Hekataions von Lagina, Vienna, 1933 (bibliog.); A. Giuliano, EAA, s.v.

Laodicea (Laodicea ad Lycum; mod. Denizli). This city was built by Antiochus II in honor of his wife, Laodice, between 261 and 253 B.C. on the site of ancient Dispolis. The city stood on a hill near the great trade route of the ancient Maeander, where the road branched off to Cibyra, Pisidia, and the coast. In the 2d century B.C. the city passed from the Seleucids to the kings of Pergamum and then to Rome. It was, together with nearby Hierapolis, known for its textile industry (the famous Ladik carpets were made there).

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

Brought early to Christianity, it was in 380 the scene of the Council of Laodicea and enjoyed considerable importance in the early Middle Ages. Though seriously damaged by the Arab invasions, it was still inhabited in the 12th century. Following its transformation into the Islamic city of Denizli, it was sacked and abandoned. The most important monument is the imposing and well-preserved stadium dating from the reign of Vespasian. It is attached on the northeast side to a large gymnasium. There are also scanty remains of two baths and two theaters, the ruins of a triple-arched gate (probably dating from Domitian's time), and the piers of a bridge, at present crossed by the road to Hierapolis. The aqueduct, with conduits reinforced in limestone, is interesting. The apse and a few pillars of a church remain; from their massive size, it was presumably vaulted. The most recent excavations have brought to light the remains of an unsual nymphaeum, reconstructed in late Roman times. Materials are preserved in the Denizli archaeological depository.

Larisa on the Hermus. An Aeolian city on the road between Pergamum and Smyrna, Larisa became a Persian possession (6th cent. B.C.) and then a member of the Delian league (5th cent. B.C.). After the Peloponnesian wars, it reverted to Persian control; in 279 B.C., it suffered severe damage from the Celtic invasions and by the 1st century A.D. it had been abandoned. Swedish and German excavations have determined that Larisa was already inhabited at the end of the 3d millennium. From the middle of the 2d millennium up to the Greek conquest (end of 8th cent. B.C.) it was a local strong point with a fortified inhabited center and a temple. In the archaic period, a peripteral temple of 6×9 columns (perhaps with a double row in front) with "Aeolic" capitals, an altar, and a simple portico were built on the fortified acropolis (ca. 570 B.C.), to which were added, at the end of the century, two palaces, one consisting of a pair of large rooms, with two towers on the façade connected by a colonnade, and the other of a megaron which, in the middle of the 5th century, was changed through the addition of three rooms set crosswise around a small courtyard. In the middle of the 5th century B.C., the walls were rebuilt in polygonal work, while in the 4th century B.C., aside from a further restoration of the fortifications, interesting enlargements were introduced into the palace to the north, through the addition of a series of megarons with a peristyle on either side. An important group of terra-cotta slabs decorated with various figures and designs and dating from around 525 B.C. were determined to have belonged to the archaic palaces.

Mansel, EAA, s.v.

Maden Şehir and Değile (Bin Bir Kilise). This was a group of small religious communities in the area commonly known as the "valley of a thousand churches." The few remaining traces are scattered over the area occupied by the village of Maden Şehir and the hamlet of Değile on the slopes of Kara Dag, a mountain near Karaman overlooking the Konya plain. The group is not mentioned in any historical source; the only elements at the disposal of scholars, therefore, are the stylistic character of the buildings and a few inscriptions, which indicate a period somewhere between the 7th and the 10th century. The churches of Bin Bir Kilise were generally vaulted; some were provided with constructions that may be construed as defense works, probably against the periodic invasions of the Arabs. Of all the innumerable basilicas uncovered by Bell and Ramsay in 1907, the ruins of only a few buildings still remain. The most important and best-preserved building in Maden Şehir is Church N.1, with three barrel-vaulted aisles, a semicircular apse and a two-story narthex; the cracks in the structure, caused originally by inefficient buttressing, made necessary the addition of reinforcement arches in all the naves. The building is well constructed in freestone and several traces of frescoes are still visible. Practically all that remains of the other basilicas, similar to Church N.1 but smaller, are the apsidal structures. A simple and earlier (probably late Roman) mausoleum is also preserved at Maden Şehir. In the upper village of Değile, which was more sparsely inhabited, there is less destruction. The ruins of three monasteries still remain and include several more or less ruined churches. The small monastery of Mahaleç (probably St. Michael) stood at the top of Kara Dag. (See II, PLS. 432, 433, FIG. 778.)

Magnesia-on-the-Maeander (Magnesia ad Maeandrum). This Carian city first stood on the banks of a tributary of the Maeander. Founded, according to tradition, by a group of Thessalian colonists at the same time as the other Magnesia (ad Sipylum), it was subject to Lydia and Persia (530 B.C.). Passing under Spartan control (end of 5th cent. B.C.), the city was moved because of frequent floods. Freed by Alexander, it passed into the hands of the Seljuks, then to the Ptolemies, and finally (190 B.C.) became subject to Pergamum. The monumental plan of the city, carried out by the architect Hermogenes of Alabanda, dates from Hellenistic times. A free city under Rome, it became an Anatolian metropolis whose importance continued through the Byzantine period. Nonetheless, devastated by the Arab invasions and beset by serious economic difficulties between the 9th and 13th centuries, the city gradually diminished in population until it became completely deserted, as it is today. Vast ruins of the Hellenistic city remain, scattered along the valley and over the slopes of Mt. Thorax, which rises above it. The town center was laid out around the great sanctuary of Artemis Leukophryene, of archaic origin (a few remains pertaining to a phase of the 6th cent. B.C. are known), but in the definitive form that has come down to us, it dates from the Hellenistic period. The temple, built entirely of marble, was pseudodipteral with 8×15 Ionic columns set on a high crepidoma, with a triple-nave cella, a deep pronaos with two rows of columns, an opisthodomos *in antis*, and a tympanum free of sculptural decoration (there are, instead, three openings). However, the frieze, which ran around the entire outside of the temple, was carved with scenes of Amazons fighting (VII, PL. 175), executed by artists of classical schooling. An altar, similar to the one in Pergamum, stood in front of the main side of the temple (the west flank); a flight of stairs led to the center of a high podium decorated with a frieze and having antae enclosing an Ionic colonnade surmounted by a small frieze in low relief. The temple and the altar are commonly attributed to Hermogenes and his school, generally accepted to have been between the late 3d and the early 2d century B.C. The sanctuary was enclosed on three sides by a Doric colonnade; on the west side, it communicated with the neighboring agora by means of a rich Ionic propylaeum. The agora had double stoai on three steps, with an inner row of Ionic and an outer row of Doric columns. All the stoai, except for the one along the east side, had shops; in the middle of the west portico two of the shops were replaced by a room, preceded by two Doric columns, identified as a shrine of Athena. At the center of the agora was the small Ionic temple, prostyle tetrastyle with an opisthodomos of two columns set *in antis*, dedicated to Zeus Sosipolis (remains of the statue of the god) and also attributed to Hermogenes. Lying outside the agora, but attached to its south side, was the Hellenistic prytaneum; nearby, to the west, are the remains of a Roman odeum. Though the theater south of the agora is a Hellenistic construction (end of 3d cent. B.C.), it was largely refashioned in late Roman times (the stage and *versurae*). The remains of the stadium, set against the slope of a hill, are particularly interesting; Hellenistic in plan, it was almost completely rebuilt during the Roman period (1st cent. A.D.) with tiers of marble seats and a covered passageway of blind arches above, similar to the one in the stadium of Aphrodisia. The gymnasium on the hill, the aqueduct on arches and the so-called "barracks," which were more likely a public bath, are entirely Roman (2d cent.). There are scanty remains from the Byzantine period, the most conspicuous among them being the defense walls, parts of which are still visible.

Malatya (anc. Milid). The hill of Arslantepe, about 5 miles north of Malatya, has been excavated at length but at irregular intervals. Between 1932 and 1938 Delaporte uncovered the entrance to a neo-Hittite palace adorned with reliefs and statues of lions. In 1947–48, and again in 1951, Schaeffer explored the area of the older palace and the remains of the gate where the above decorations were probably originally located. The earliest cultures have been revealed by deeper soundings; they contain pottery similar to the

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

pottery of el-'Ubaid, Susa I and II phases, as well as to that of the early Anatolian Bronze Age II and III. Since 1961, the excavations have been carried out by Italian archaeologists. The transitional phases between the end of the Hittite empire and the establishment of the neo-Hittite kingdoms are of particular interest. The Gate of the Lions and the city walls are, in fact, laid out on various levels and pass through different phases of reconstruction. The various decorative elements in the last reconstruction were juxtaposed, but it is, even so, possible to detect a chronological sequence. On the basis of their style and iconography, E. Akurgal has dated the lions to 1050–900 B.C., the carvings with the stag hunt to 900–850 B.C., those with the lion hunt to 850–800 B.C., while the large statue of the king, clearly Assyrian in cast, is dated to between 713 and 700 B.C. These last dates coincide with the Assyrian occupation.

Mersin (Yümüktepe). This Cilician site was excavated by J. Garstang, who uncovered 33 archaeological levels containing material that covers a period from the Neolithic to the Islamic age. The site is particularly interesting because it permits the establishment of a connection with the cultures of Mesopotamia and North Syria. The gradual shift in neolithic times from pottery with imprinted decoration to pottery with painted decoration is notable. In the Chalcolithic Age the successive influence of the cultures of Hassuna, Tell Halef (to an overwhelming degree), and, lastly, el-'Ubaid are, in fact, visible. A fortress was found on Level XV with elaborate defense systems, the residence of the chief and lodgings for the garrison. The period between the end of the Chalcolithic Age and the beginning of the 2d millennium is poorly represented, but corresponding excavations at Tarsus have made it possible to complete the data. Level VII presents a fortification with towers and double curtain walls of the Hittite type, datable from around 1500. Even so, Mersin did not become an integral part of the Hittite empire until the kingdom of Kizzuwatna lost its political independence. The architectural remains and, to a greater extent, the pottery afford evidence that the site was occupied during the 13th–12th century (perhaps by the Mycenaeans) and uninterruptedly from the 7th to the 4th century B.C.

Miletus (mod. Balat). A city situated at the end of a peninsula at the mouth of the ancient Maeander, between the sea and the Gulf of Latmos, in an area formerly inhabited in the 2d millennium B.C. (Kalabaktepe Mound). In the 11th century, after a long struggle with the Carians it was settled by Greeks of Ionian stock. In the 7th and 6th centuries it was the most active and prosperous of the 12 cities of the Ionic League and it founded numerous colonies along the Hellespont, the Propontis, and the Black Sea. During the Persian invasion of 546, under Cyrus the Great, it succeeded, with the consent of the conqueror, in gaining control over the important sanctuary of Didyma, some 13 miles away. After the failure of the Ionian revolt in 496 B.C., the city was destroyed and later rebuilt only after it had been liberated from the Persian domination (479 B.C.) and made a member of the Delian League. Once again subject to the Persians (402 B.C.), it recovered its independence after the conquest by Alexander the Great (334 B.C.). Incorporated into the Seleucid states (301 B.C.), after 190 B.C. it passed to the kings of Pergamum and then to Rome. In the Hellenistic and Roman periods it enjoyed prosperity, though as a result of the silting up of the Maeander and the competition of Ephesus, its commerce gradually decreased. Though having fallen into considerable decay, it became a Christian metropolis and then shared the fate of the other Byzantine coastal cities. It was devastated by the Arab invasions, and again by the Seljuks (end of the 11th cent.). Temporarily reconquered by the Byzantines, it was lost to the Turks in 1328. In 1352, the Venetians obtained permission from the Turks to set up a commercial base in Miletus, and they also built a church there. After the temporary conquest by Tamerlane, it was reoccupied by Murat II. Meanwhile, the city and its harbor continued to deteriorate until, reduced to a poor village, it was given the name of Balat (from the Greek *Palatia*). The history of the city is more or less summed up in the history of its walls; traces of the first circuit of walls have been discovered near the theater (ca. 650 B.C.). Between 411 and 402, Miletus was rebuilt on a checkerboard plan, and at that period was encircled by new walls with four gates. At the beginning of the 2d century B.C., the south crosswall, extending in a sawtooth line and with posterns set between projecting towers, was built; the gates were flanked by towers and the one in the south wall, facing the mainland, where the principal road entered the city ("Sacred Gate"), was preceded by an outgate, it, too, flanked by two towers set crosswise. The south wall and the "Sacred Gate" were rebuilt in the 1st century B.C., while other restoration and reconstruction was undertaken following the invasion of the Goths (A.D. 263). In Byzantine times, perhaps during the reign of Justinian, a retrenching wall was built against the theater and the Baths of Faustina, which became two strongholds. The castle, which was built behind the theater, is relatively recent (after 1493). The city was centered around three agoras, the north, the south and the west. Those at the north and south, facing the main street, were separated by a small temple dedicated to the cult of Augustus and Rome and the bouleuterion. The north agora (295×34 ft.), the oldest of the three, consisted of a two-storied Doric quadriporticus with shops around it and a small Ionic tetrastyle prostyle temple (2d century B.C.) on the west side; the plan is Hellenistic, with various modifications dating from Roman imperial times. The bouleuterion, built between 175 and 164 B.C., consisted of a rectangular hall containing the hemicycle for the assembled leaders and of a forecourt with porticoes on three sides; the fourth side, the façade of the assembly hall, was left open. Entrance to the building was through a Corinthian tetrastyle propylaeum, open toward the inner courtyard, in the center of which was a rich altar and a tall structure of two columns between antae. The Doric columns of the colonnade were shorter. Doric semi-colonnades and clypei decorated the outer walls of the bouleuterion. In front of the north agora was the "Delphinion," an important sanctuary of Apollo built in the 4th century on the area formerly occupied by a group of archaic religious buildings. In the Hellenistic period, it consisted of a precinct, rectangular in plan, with three gates on the west side and double porticoes (stoai with two rows of Doric columns) along the other three. The *sub divo* central area contained an altar, three exedras, statues and *cippi*. In Hadrian's time, the porticoes, reduced to a single nave with composite columns, were set around all four sides and had a Corinthian propylon. The entrances to the two agoras, the nymphaeum, a Hellenistic gymnasium (2d cent. B.C.), the so-called "Capitus" stoa, two stories high (reign of Claudius) and, later, the church, all faced onto the small square of the bouleuterion, the true center of the city. The nymphaeum consisted of a square pool and a back wall ornamented with niches and three stories of marble colonnades, while two rows of columns and open epistyles projected on either side. The pediments of the architraves of the two upper orders were triangular or with volutes; the lower order, instead, had flat blocks. The monument was built in honor of Trajan's father, proconsul of Asia in A.D. 78–80. The south agora (528×553 ft.) was begun in the 3d century B.C.; its construction covered a long period of time. There was a simple colonnade, about 23 ft. wide, along the east side with two rows of rooms opening onto the colonnade itself and onto the adjacent street, while double-aisled stoai occupied the other three sides; the south stoa was the only one serving a row of rooms. The gate of the south agora facing onto the small square of the bouleuterion, originally restrained in design with two columns, was rebuilt in the Antonine Age as a monumental triple-arched entranceway with a broad central pediment and small side pediments set on two orders of protruding colonnades. Lastly, at the back of the south agora stood a vast Hellenistic double-aisled storeroom (535×43 ft.) and the Serapeion (3d cent. A.D.) with a rich composite propylon and a triple-aisled columned hall. Another group of monuments, east of the agora, included the stadium, the west agora and the Temple of Athena; on the other side of the bridge was the theater. The stadium, a rectangular arena (96×638 ft.) flanked by two rows of seats, was built in the first half of the 2d century B.C.; in the 3d cen-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

tury A.D. a new monumental entrance was built on the east side with two stories of open colonnades. Near the stadium was the third agora, connected to a hexastyle peripteral Ionic temple of Athena (5th cent. B.C.), only the foundations of which are still visible. The west agora (544×259 ft.), still not completely investigated, was built in the late Hellenistic age with Doric stoai on three sides, apparently devoid of shops and an entrance propylaeum. A small temple, converted into a private house in the late Roman period, was set into the south side. The large theater, built up against a small hill and facing one of the four city ports, dates in its present form from the 2d century A.D. Large stairways led up from the entrances on either side of the *scaena* to the *praecinctio*. Of the *scaena*, only the lower part and the pillars of the hyposcenium remain. The bathing establishments in Miletus are both numerous and important. The oldest is the Hellenistic gymnasium, near the nymphaeum; the building, which was entered through a testrastyle propylaeum, consisted of a *palaestra* with five rooms along the back: along the front, the columns were taller and Ionic in order, whereas along the two sides they were shorter and Doric. The connecting Baths of Vergilius Capitus (2d cent. A.D.) consisted of a *palaestra* with a pool rounded at the end, an apodyterium, a frigidarium, and a large tepidarium. The Baths of Faustina (XII, FIG. 296), donated by the wife of Marcus Aurelius and rebuilt by a private citizen in the latter part of the 3d century, are important, both for their size and for their state of preservation; they included a large, nearly square peristyle, a long gallery with niche (apodyterium), a frigidarium, tepidariums, and a caldarium of imposing dimensions. The small baths, opposite the north agora, dating from the end of the 1st century A.D., consisted of a peristyle with an exedra at the back, through which the dressing rooms were entered, the tepidariums, and a central caldarium. In the late period (4th cent.), important restorations were undertaken: the original marble paving stones, among other things, were replaced by mosaics.

What was presumably the cathedral (late 5th to early 6th cent.), one side of which communicated with the nymphaeum, was not very large. Preceded by an atrium flanked by the baptistery, it consisted of a central hall or nave and two side aisles with marble piers and an ambulatory around the apse; the south end consisted of a small rotunda with five semicircular niches set into the thickness of the walls.

The Islamic city includes the Ilyas Bey Cami with its hammam; the remains of two other baths; two mosques; and two *lahans*. The Ilyas Bey Cami itself (1403) is the most important of these monuments; it is a square building covered by a dome resting on stalactites, and opens, by means of a large triple-arched doorway supported by two columns with rich perforated transennae, onto the adjacent atrium.

Mopsuestia (mod. Misis). A Cilician city on the banks of the ancient Pyramus, Mopsuestia was founded, according to legend, by the Greek hero, Mopsos, in the 11th century B.C. The city's history is, generally speaking, identical with that of the other Cilician centers: in Hellenistic times it was given the name of Seleucia, and under Roman rule it enjoyed a period of considerable prosperity. An episcopal see in the 6th century, it was sacked at various times by the Arabs in the 7th and 8th centuries. Disputed by the Armenians, Byzantines and Arabs, in 1375 it passed into the hands of the Mamelukes and in 1575 became a part of the Ottoman Empire. Today it is a modest center known as Misis. Little investigated, the classical remains of Mopsuestia visible to the eye include an *enceinte* wall with numerous medieval restorations, a theater, an amphitheater, a stadium and several ruins identified as a temple of the sun; all these monuments date from Roman times. The remains of an extramural church, dedicated to the martyrs (5th cent.), with interesting and rare mosaics (Noah's Ark), date from the Byzantine period.

Mylasa (mod. Milas). This Carian city, already inhabited in the 2d millennium, was the seat of a Persian-controlled tyranny in the 6th century B.C., and in the 4th century B.C. was the capital of the semi-independent satrapy of Caria, before the dynasts moved to Halicarnassus. After the Macedonian conquest it was disputed by Antigonus, the Lagids, and the Seleucids; liberated in 190 B.C. by the Romans, it passed under the control of the Rhodians and afterwards (129 B.C.) of Rome itself. Notably prosperous in imperial times, it became an episcopal see (A.D. 687). Occupied by the Seljuks in the 13th century, it became the capital of an independent emirate up until 1426, when it was occupied by the Ottomans. In the upper city (Hisarbaşi) there is an Ionic temple on a podium dedicated to Rome and Augustus; in the lower city there are the remains of walls with a Roman barrel-vaulted gate with Corinthian pilasters and of the Hellenistic Corinthian temple dedicated to Zeus Labrandeus. Near the city are the remains of a Roman aqueduct and of an interesting sepulchral monument, with a dado surmounted by a Corinthian peristasis (the corner pilasters are also Corinthian) covered by a dome (1st cent. A.D.).

Myra (mod. Demre). This Lycian city was of very ancient origins, but was particularly important in the Hellenistic period, when it was an influential member of the Lycian League, and in Roman times, when, under Theodosius II, it became the metropolis of Lycia. Of the greatest importance to the establishment and propagation of Christianity was the cult of the martyr St. Nicholas, whose remains were later removed to Bari, Italy. Ravaged during the Middle Ages, the city was reduced to a small village (Demre). The remains of the classical urban monuments include the ruins of a temple attributed to Hadrian and the Roman theater with 47 rows of seats (the *scaena* has almost completely fallen into ruins). The Basilica of St. Nicholas, a domed structure with a large apse and a few traces of frescoes, was largely rebuilt by Russian monks. The well-preserved rock-cut necropolises, including tombs with architectural façades and richly decorated with reliefs, are datable to the 5th century B.C.–3d century A.D.; there are also a number of monumental Roman sepulchers nearby.

Pinelli, EAA, s.v.

Nicaea (mod. İznik). Situated in a strategically important position at one end of the lake of the same name, Nicaea, founded by Lysimachus in honor of his wife (301 B.C.) on a formerly inhabited site, enjoyed its greatest importance beginning with the Roman period (from 74 B.C.), when it rivaled the Bithynian capital of Nicomedia. Devastated by an earthquake in A.D. 123, it was soon rebuilt, but it suffered even more severe damage in 258 from the invasion of the Goths. For a long time the city maintained considerable standing; it was the scene of ecclesiastical councils (325 and 787) and remained Byzantine until 1081, when it fell into the hands of the Seljuks. Afterwards, it was conquered time and again, alternately by the Turks, the Crusaders (1097), and the Greeks. Peace returned under the Lascarids (1204–61), when it gained extraordinary prestige as the capital of the empire. In 1331 it was conquered by the Ottoman sultan, Orhan, and enjoyed its last moments of prosperity. With the Ottoman conquest of Constantinople, Nicaea lost all importance and was reduced to a village, which occupied only one part of the ancient inhabited area. The walls, which followed the original Hellenistic layout, date from the period between the reign of Domitian (78–79) and that of Claudius the Goth (268–69), with various medieval alterations. Except for the above-mentioned sections of the walls, all that remains of the Roman monuments of Nicaea is the poorly preserved Hellenistic theater, set on a vaulted substructure, and a monumental portico.

A large, relatively well-preserved church (St. Sophia, 8th cent.) dates from Byzantine times; the ruins of the Koimesis Church (6th and 10th cent.) are scanty and are limited to the foundations.

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

The Islamic monuments, all of them Ottoman of the earliest period, are especially important. Outstanding among them is the Yeşil Cami (Green Mosque), a square building with a large cupola preceded by a portico, with the doorway, the capitals and the marble windows, as well as the inside of the mihrab, decorated with refined carvings. The glory of the monument, however, is the magnificent enamel-tiled minaret. Other 14th-century mosques include the Kutbeddin and Candarli Ibrahim Paşa mosques dating from the time of Mehmet Çelebi; also important are the imarets — T-shaped buildings with a portico in front (Nilufer Hatun Imaret, 1389, and Yakub Çelebi Zaviye) — and lastly the open-plan Medrese of Süleyman Paşa (1336?), with domed rooms, and the mausoleums of Reyhan, Çandarli Hayrüddin Paşa (1379) and Halil Paşa (1455). Between the end of 1400 and 1700 İznik was famous for its ceramic workshops, which produced articles of outstanding quality, both for the excellence of the materials and the fineness of their decoration and forms, as well as for the richness of their colors.

Niğde. This is the city, almost 4,000 ft. above sea level on the Anatolian plateau, which some authorities identify with the ancient Kadena. Conquered by the Seljuks at the end of the 11th century, it formed part of the Sultanate of Rum. Passing, after the Mongolian dominion, into the hands of the Karamanoğlu beys, it became at the end of the 15th century a part of the Ottoman Empire. The citadel, dating from Seljuk times, was restored under the Ottomans. Among the more outstanding monuments are the Ak Medrese (1409), built by the Karaman beys, with a courtyard surrounded by pilasters joined by pointed arches; the polygonal Türbe of Hadabend Khātūn (1312), especially interesting for its decoration, which includes the usual geometrical and floral designs and unusual figures of birds and animals with human heads; and the Alaeddin Cami (1203), with a prayer hall consisting of three parallel aisles, the last bays of which are covered over with domes.

Nimrud Dagh. A mountain in the vilayet of Malatya with an enormous tumulus, some 525 ft. in diameter on top (6,888 ft. above sea level), this point is visible from a great distance. At the base of the tumulus are three terraces, two (on the east and west sides) very large and similar in structure, and a third, on the north side, smaller. The architectural complex, defined in numerous inscriptions as the hierothesion of King Antiochus I of Commagene, was a temple-tomb built about the middle of the 1st century B.C.; access was by means of two sacred ways with gigantic flights of stairs. On the two large terraces (the west terrace is steeply declining) were steles with human figures, a gallery of the forebears of Antiochus (Persian paternal ancestors on the east side, Seleucid maternal ancestors on the west side) and colossal statues of Antiochus among Greco-Persian divinities (Zeus Oromasdes, Apollo Mitra, Artagne Herakles, the personification of Commagene). The altar of the cult stood on the east terrace among sculptures of eagles and lions.

Nyssa (mod. Sultanhisar). A Carian city on a plateau overlooking the Maeander, this was founded, according to legend, by Laconian colonists, or, according to another version, by Antiochus I of Syria. Already important under the Seleucids and the Attalids, it became even more so under Roman rule, especially in the 1st century B.C., when many of its monuments were built. Sorely tried by the course of events in the late Middle Ages and by the simultaneous growth of the nearby city of Aydın (anc. Tralles), it was gradually deserted and only a part of the population remained, forming the modern city of Sultanhisar at the foot of the ancient city. On the plateau impressive remains from the classical period are still visible. Among them, the amphitheater with its shorter sides curved into a semicircle and the arena overlooking the River Thymbros, is particularly outstanding for its originality. Farther north are the remains of the late Hellenistic theater. The eastern part of the plateau was occupied by a large rectangular square, of which only a very small part has been excavated, containing a simple Doric portico along the south and west sides and double-aisled stoai with Ionic marble columns along the north and east sides; the entire architectural complex seems to date from the late Hellenistic period. Directly west of the agora are the well-preserved ruins of the *gerontikon*, a building used for the meetings of the council of elders, with a semicircular auditorium supported by annular vaults and divided into four sections by stairways; at the back stand the remains of a small portico. The remaining part of the plateau was occupied by other public buildings such as the gymnasium and the library. All that remains of the gymnasium (or baths) are several vaulted rooms made of brick; a little farther north was the Roman library (imperial period), a small building consisting of a series of vaulted rooms opening onto a central hall; it was entered from the south, and various tiers of niches, where the rolls of parchment were kept, were set into the walls to the right and left of the entrance. West of the plateau, there are the remains of a vast Roman necropolis with two-storied mausoleums, one of the stories partly underground.

Patara (near mod. Kınık). A city on the Lycian coast at the mouth of the ancient river Xanthus (mod. Koca Çayı), Patara is recorded as existing only from the end of the 4th century B.C.; it was the main harbor of the region, and in the 1st century B.C., the capital of the Lycian League. It was particularly prosperous in the Roman period; in this respect, it might be remembered that Patara was one of the cities mentioned in the Acts of the Apostles. It suffered a sharp decline in the late Byzantine period and was completely abandoned. The sanctuary of Apollo, in which a sculptural group by Bryaxis stood, must have been an important monument of the city, but it has been impossible to identify. The monumental triple-

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

arch gate, however, is well preserved; it dates from the late Hellenistic period. A rather large Roman theater, including the *frons scaenae*, was still well preserved until a few years ago. There are remains of Roman baths, a Roman temple, large horrea, and a cistern partly sunk into the rock of the acropolis. In the surrounding countryside, there are various ruins of Lycian-type tombs from a vast necropolis, and several large Roman mausoleums.

Pazarlı. A site in a mountainous region of the vilayet of Yozgat. Excavated in 1937–38, four different periods of occupation have been identified. The earliest traces of habitation date back to Early Bronze Ages I and II, revealing cultures similar to those on the central highlands. In Hittite times, the locality was sparsely settled. The really important ruins date from the Phrygian period; at that time a fortified stronghold was built, as well as private houses, probably two stories high, set on terracings. The outer walls of the houses were decorated with slabs of glazed terra cotta, with figures of centaurs, warriors on the march, and animals fighting. Most of the pottery is of the second Phrygian style, with decorations covering the entire surface of the vessel. Recent explorations such as that which uncovered the Ionic temple of Hemitheia (2d half of the 4th cent. B.C.) with 6×12 marble columns and a cella with a niaskos have established that Pazarlı is to be identified with the classical and Hellenistic city of Kastabos. The temple is encircled by a temenos with shrines ornamented with imitation incrustations and containing statues. Inside the temenos, around the temple, are several rooms which were perhaps treasuries.

Perga (Perge). A city of ancient origins on the trade route between Pisidia and Pamphylia, Perga belonged first to the kingdom of Lydia, and then to Persia. Vanquished by Alexander the Great (333), it was fortified with massive *enceinte* walls in Hellenistic times by the Seleucids. Conquered by the Romans after the battle of Magnesia (190), it enjoyed great prosperity in Roman times and remained prosperous under the Byzantines. The city extended partly over the plain and partly on the hill to the north (the acropolis and the original city). The Hellenistic walls in *opus quadratum* are almost completely intact; inside are the remains of a monumental gate consisting of two round towers, leading into a sort of inner courtyard adorned in Roman times by two stories of colonnades. This led, in turn, to a large tributary arch, dating from the reign of Hadrian, and then on into a vast colonnaded street (1st cent. A.D.) with two rows of porticoes on gradins and a row of fountains down the middle. To one side of this monumental gate was a small marketplace, laid out around a peristyle with a central tholos; on the other side are baths (2d–3d cent.). There is also a well-preserved theater dating from the reign of Trajan (the *scaena* has fallen in ruin); part of the nearby stadium, built on vaulted substructures, is also in relatively good condition. At the far end of the colonnaded street is a palaestra; an inscription names a certain Julius Cornutus as the donor. The celebrated temple of Artemis Pergaia has not yet been located. The necropolises are important, and have yielded fine sarcophagi, dating generally from the 2d–3d century A.D.

The Christian period is represented by the ruins of two large basilicas; one was perhaps the cathedral, the other stands near the monumental gate. There was another small church along the colonnaded street, and the remains of a fourth church are visible on the hill southeast of the city.

Pergamum (Gr. Pergamon; mod. Bergama). The city was centered around a fortress, built by Lysimachus on a rocky height which was to be the acropolis. After the death of Lysimachus (281 B.C.), it was taken over by the strategos, Philetairos, who repelled the attacks of Antiochus I. After Philetairos' death in 263 B.C. the principality passed into the hands of Eumenes I, and then to Attalus I (241–197) who, with the help of Rome, enlarged its territorial dominions. After the Roman victory at Magnesia in 190 B.C., Eumenes II succeeded in extending the kingdom until it spread from the Hellespont to Cilicia. This same king, Eumenes II (197–159), encouraged the construction of important monuments in the capital and the setting up of state industries and private enterprises. Pergamum became, therefore, a city of major importance, rivalling Antioch and Alexandria (the Pergamene library was one of the most important in the ancient world). The son of Eumenes II, Attalus III (133 B.C.), bequeathed his kingdom to Rome. Pergamum thus became the first base of Roman influence in the East, and the city grew beyond the walls that enclosed the acropolis and the palace of the Attalids; its vitality was to diminish only with the waning of Byzantine power in the 8th century. In 716 it was besieged by the Arabs and the Byzantines repaired the city and the fortifications as best they could, utilizing much ancient material; even so, further assaults and pillaging reduced the ancient metropolis to a small village. After the Crusaders conquered Constantinople in 1204, the city was fought for by the second Latin emperor, Henri de Hainaut and the king of Micaea, Theodore I Lascaris (1206–22). It ultimately fell to the Turks in 1306; Ibn-Battūtā, who visited it in 1336, described it as a city in ruins overlooked by a fortress. It passed to the Ottomans (Orhan I) in 1336 and, except for the brief interval of Tamerlane, remained in their possession. The monuments of Pergamum were excavated by German archaeologists, who have been active on the site for more than eighty years.

The Hellenistic city, which overlooked the Caicus (mod. Sakir Çayi) valley and was served by two streams, grew up on the hill of the acropolis, crowned by the royal palace. It was surrounded by a wall and the foundations of the main gate (constructed, it would seem, at the time of Eumenes II); facing south, an entranceway with two towers, a porticoed courtyard, and a guard house still remain. Near the gate stood the lower agora, built by the same king. The square was quadrilateral, measuring 200×110 ft. surrounded by Doric porticoes with shops on three sides. The shops on the fourth (south) side, however, were about 13 ft. lower than the others, and faced outwards onto a separate portico. A paved street following an irregular and winding course up to the gate ran along two sides of the agora and then continued on to the upper city; a large public fountain faced onto this street. Over the lower agora a cistern, shops and houses, one of them identified as that inhabited by the Roman consul Attalus, have been excavated. Higher up there were three long terraces set above each other at equal distances against the hill; these were occupied by the various buildings of a large gymnasium. In Roman times part of the buildings were converted into public baths. The terraces were occupied by gymnasiums, the lower one for children (boys), the middle one for adolescent boys, and the upper one for young men. Each terrace had a large rectangular courtyard surrounded by Doric porticoes. In Roman times, the upper portico was rebuilt into two tiers of Corinthian columns and small baths were added on the right and left sides. An odeum and two large halls with apses used for the imperial cult were laid out along the north side of the courtyard, that is up against the mountain. Still another terrace, higher up, was occupied by a sanctuary of Demeter, the *prytaneion* (administrative headquarters of the city), and the Ionic temple of Hera Basileia (ca. 140 B.C.), set between a semicircular exedra and a square room. The sanctuary of Demeter was entered from the west side of the upper gymnasium; it consisted of a long courtyard with a portico along the south side (overlooking the gymnasium below); almost half the north side was taken up by nine rows of seats for the spectators of the mysteries; the rest of the north side was occupied by a portico with several rooms off it, in front of which stood the small Ionic temple *in antis* of the goddess with relative altar. These buildings have been attributed to the 3d century B.C. — to the reigns, that is, of Philetairos and Eumenes I; the propylaeum, instead, dates from the reign of Attalus I (2d cent. B.C.). Towering over these two architectural groups (the agora and the gymnasiums) to the north was the acropolis, whose buildings, set on the edge of a cliff overlooking the Selinos valley, were encircled by the isodomic walls of Eumenes II, and radiated out from the auditorium of the theater. This theater (VII, PL. 148), well preserved, has a steeply sloping auditorium hewn out of the side of the hill; the royal loggia was made of marble. There are practically no traces of the *scaena* dating from Roman times (it was temporary until the 2d cent. B.C.). Behind the stage was a long terrace supported by massive substructures, at the north end of which stood the hexastyle Ionic temple of Dionysos Kathegemon, of Hellenistic origin, which,

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

following the restorations undertaken by Trajan, was rededicated to Caracalla at the beginning of the 3d century A.D. Laid out, then, from south to north, was the upper agora with porticoes around three sides, the south one, three stories high, opening both onto the agora and towards the outside and broken up by the passage of the street. This street led to a propylon which on the east side gave access to the temenos of the great altar of Zeus and Athena, part of which was built on an embankment. The great altar, whose date is uncertain (ca. 181–159 B.C.), consisted of a dado with two projections with a stairway between them, surmounted by a thick-set Ionic colonnade enclosing a wall. Both the dado and the upper part of the back wall were decorated with friezes containing, respectively, a gigantomachy and a running account of the myth of the Pergamene hero, Telephus. The two friezes, carved by various artists at different times, are among the masterpieces of Pergamene art, in which are also to be included the long row of small sculptures set up by some Attalid king (perhaps Attalus II) along a continuous base against the surrounding wall of the temenos (perhaps in substitution of a colonnade that was in the process of being built) and portraying battles between gods and giants, Greeks and Amazons, Greeks and Persians, Pergamenes and Galatians. Small copies of these sculptures existed in ancient Athens. To the north, in the junction between the terrace occupied by the great altar and that occupied by the sanctuary of Athena, there was an elongated double-aisled building with central colonnade as well as a series of porticoes facing the road, which then led up to the temenos of Athena Polias (built by Eumenes II), surrounded on three sides by a two-storied stoa, the lower story Doric, the upper Ionic, with great carved balustrades (arms and trophies). The Doric temple (peripteral hexastyle), from the 4th century B.C., dedicated to Athena Polias and converted into a church by Justinian, is not to be considered a part of the Hellenistic city, in that it existed before the acropolis was laid out. Various temple treasures existed on the terrace of Athena Polias, among them a rotunda built by Attalus I, where the "Dying Gaul" and the "Gaul killing himself and his wife" are commonly supposed to have been located. Opening off of the north portico of the temenos was the great library. The highest terrace, supported by a series of vaulted substructures from Hadrian's reign, contained the Traianeum, a Corinthian peripteral hexastyle temple of the Roman type, as well as stoai around three of its sides. Behind all these constructions and set up against the walls of the acropolis were numerous buildings: military storerooms lay to the north and in the middle stood the barracks and royal palaces, one of the most striking of them being the palace of Eumenes II with its great Doric peristyle; to the south, outside the walls of the citadel, however, and standing along the side of the road, was a group of rooms centered about a peristyle which some scholars consider a heroon, or dynastic sanctuary.

The Roman city, spread out over the plain, contained important monuments such as the circus, the theater, and the amphitheater. A well-preserved and important structure is the Kızıl Avlı, or Red Basilica, a rectangular hall with large lateral niches and on either side two peristyles leading into two round domed rooms. This group of buildings (2d cent. A.D.) was enclosed by a large wall which spanned the River Selinos on two large arches (623 ft. long). The main building, rightly considered a Serapeion, was converted during the late Empire into a basilica, with attached rotundas, dedicated to St. Paul. Lastly, on a small hill southwest of the city, was the celebrated Aesculapium, situated at the end of a porticoed sacred way, about half a mile long. The road terminated in a courtyard with Corinthian colonnades around three sides, which led, by means of a propylaeum dating from the reign of Hadrian, into a great sacred peristyle bordered by porticoes on the northwest (Ionic colonnade) and south sides (cryptoporticus and substructures). On the east side, together with the above-mentioned propylaeum, was the temple proper, a round structure with alternating semicircular and rectangular niches, and a tetrastyle *projectum* as well as a round two-storied hall (the so-called "Temple of Telesphorus"), with deep semicircular niches, while at the extreme north end was a library built in Hadrian's time. On the north side was a small theater, almost perfectly preserved, and the also well-preserved Ionic stoa to the south opened onto a gymnasium. At the center of the peristyle stood the fountain, and a cryptoporticus used for physical training led to the great circular hall on the east side. Most of the buildings of the Aesculapium are Roman, dating from the 2d century A.D.

Polatlı Hüyük. Situated west of Ankara and excavated in 1949, this site has yielded sequences of stratified materials covering most of the 3d and the 2d millennium. The settlement came into being in the Early Bronze Age (15 levels and two radical reconstructions) and continued on into the Middle and Late Bronze Ages (16 levels of occupation). According to A. Götze, Polatlı was, along with Demirci Hüyük, one of the representatives of the Sakarya group. The devastation which took place during the Early Bronze Age enabled excavators to distinguish two distinct phases that are also to be found in other sites on the plateau (Dundartepe, Etiyokuşu, Karaz, Karaoğlan), and to note the absence of any material from the postdisaster period in two such important Anatolian sites as Alaca Hüyük and Ahlatlibel. The Early Bronze Age pottery is the same as that found elsewhere in the same culture, but here earthenware with a glossy red surface gradually prevails over that with a glossy black surface; the decoration, consisting of broad riblike incisions, is of the most common type. Contacts with the Hellespont area are affirmed, not only by the jugs with obliquely cut spouts, but also by the characteristic depas which appears between Levels I and II, before the devastation, thus establishing a correlation between this historical event and the one which marked the downfall of Troy II. Pottery, usually decorated with white lines on a dark background, is not infrequent and sheds light on the possible relations which may have existed between the Beycesultan Chalcolithic and Mersin Level XII, as well as nearer sites such as Karaoğlan and Alişar. Polatlı II is distinguished, towards the end of the period, by the appearance of "Cappadocian" pottery and the curious so-called "red cross bowl"; this latter is generally characteristic of the end of the Early Bronze Age III all over the Anatolian peninsula. "Cappadocian" ware, together with pottery forms associated with the Assyrian *karum* of Kültepe, is present in Phase III, but at the end of this phase, monochrome types, characteristic of the early part of the 2d millennium, are already in evidence. The final levels, dating from the Late Bronze Age (Phase IV) cover the Hittite period up to the devastation which affected the entire Near East (about 1200 B.C.). The sepulchers are of the standard type; the presence of a cist tomb on Level VI is, however, to be noted. On the level immediately above, a circular structure, with an entrance dromos and a great deal of pottery material piled up nearby, was discovered over the grave itself. The similarity with the Etiyokuşu structure is great, though the latter has no grave beneath, and it is likely that both buildings were connected with funeral cults.

Priene. The city in existence today was founded about 350 B.C. by the inhabitants of an older city who had been forced to migrate as a result of the constant silting up of the Maeander. The older city, whose location is uncertain, was founded by the Ionians and sacked by the Cimmerians (645 B.C.); subject to the kings of Lydia and Persia (545–544 B.C.), it took part in the Ionian revolt and fought at Lade (495 B.C.). Briefly a member of the Delian League, it returned to Persian overlordship; it was during this period that the city was relocated. In 334 the new city was visited by Alexander, who dedicated the temple of Athena Polias. A Seleucid possession, it passed for a short period under Ptolemaic rule (246–196 B.C.). After becoming a Roman possession in 129 B.C. it led an undistinguished existence in imperial times and very few monuments were built or altered, so that Priene is almost completely Hellenistic in aspect. In the 13th century it was little more than a village amidst the ruins

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

and was easily conquered by the Seljuks and then abandoned. The city was laid out on the slopes of Mt. Mycale on a series of four terraces of almost equal height, with a sharp rise of more than 1200 ft. between the inhabited center and the top of the acropolis, or Telonieion. The inhabited center was enclosed by a wall, reinforced by bastions, and, at the bottom, by 16 towers. The acropolis stood apart, enclosed by a wall with 10 towers and devoid of monuments. There were four gates into the city, corresponding to the large main streets which ran in an east-west direction; two of these gates were in the western sector. Six large streets running east and west were connected by sharply sloping alleyways crossing them at right angles and by steps forming blocks 160×120 ft. around. The four levels of the city were laid out as follows: the agora in the middle with its various accessories; above it, the temple of Athena and below it, the gymnasium and connected stadium, while the fourth and highest terrace, detached from the others, was occupied by the sanctuary of Demeter. The city was served by an aqueduct with interesting hydraulic works (clay pipes, a water tower and decantating basins). There are only a few religious buildings in Priene, but they are all of great interest. The sanctuary of Athena Polias included the famous peripteral temple made of limestone, with 6×11 Ionic columns, opisthodomos and a deep distyle pronaos *in antis*, designed by the architect Pytheos (who, with Satyros, also designed the mausoleum) and dedicated in 334 B.C. by Alexander. Standing in front of the temple is an altar dating from the 2d century B.C.; it is similar to the great Pergamum altar, consisting of a flight of stairs enclosed on three sides by a dado decorated with friezes of gigantomachy and surmounted by an Ionic colonnade. The temenos, which contained a thesauros as well as various statues, is entered through a propylaeum dating from Roman times, while the south side is occupied by a Doric stoa dating from the 2d century B.C. The much smaller sanctuary of Zeus Olympius was set into the east side of the agora. The temple, where Zeus and perhaps also Asklepios were worshiped, was an Ionic tetrastyle, dating from the 2d century B.C.; it stood at the end of a square bordered on the north and south sides by Doric stoai (with shops behind them). The sanctuary of Demeter and Kore (end of 4th cent. B.C.) consisted of an *enceinte* wall open on the east side and containing, aside from a subterranean chamber for offerings, a square building (the temple proper) oriented in a north-south direction, but with a small Doric entrance portico on the east side. In the eastern part of the city was the sanctuary of Egyptian divinities (middle of 3d century B.C.), consisting of a simple temenos set around an altar dedicated to Isis, Serapis, and Anubis. Two small private sanctuaries dedicated to Alexander and Cybele still exist. The agora was entered on the west side through an arch which rested on the enclosure dedicated to Zeus. The street entered the agora and skirted the north side. There were porticoes around all four sides of the square; along the west side, a Doric stoa with shops, along the east side, another Doric stoa, but without shops, along the south side, still another Doric stoa with the central columns engaged in the wall which protected a long double-aisled room at the center of the portico from the wind; the north side was occupied by the *hiera stoa*. This stoa consisted of a double row of columns, Doric on the outside, Ionic on the inside, and a line of 15 shops along the back. Its construction dates from the middle of the 2d century B.C. Behind this portico is the well-preserved *ekklesiasterion* (late 3d cent. B.C.), an almost square assembly chamber, with stairs rising at right angles around the three sides nearest the hill, and a niche on the fourth side furnished with a bench and framed by an arch. Next to the *ekklesiasterion* was the Roman prytaneum with the usual peristyle construction. The theater, contemporary with the founding of the city, is particularly important because of the extraordinarily well-preserved condition of the *proedria* (front) seats and, above all, of the stage, every alteration of which has been investigated, from the original phase (middle of the 2d cent. B.C.), with *logeion* having only one door, to the second, Hellenistic, phase with a freely accessible *logeion* having three *thyromata*. There were two gymnasiums in the city: one, on the same level as the Temple of Athena, almost completely in ruins, and subjected to radical alterations in Roman times (baths), and the other, known as the lower gymnasium, at the southern end of the city, which consisted of a palaestra with a portico of Doric columns with various rooms off it (the central room, or ephebeion, having two Ionic columns at the entrance), used for exercises or ablutions (basins with water spouts formed by lion protomas). Attached to the lower gymnasium was a stadium, approximately 625 ft. long, with a Doric stoa overlooking it on the north side; the stadium and the gymnasium probably date from the second half of the 2d century B.C. The houses are very important; they were of various types, but most of them were built around a central courtyard, often with columns on one or more of the sides. The main rooms were usually ranged along the back of the house and the entrance frequently consisted of a long corridor. Traces of pictorial decoration, in the so-called "Style I" and imitating marble facings are often encountered. There are relatively few buildings dating from the Byzantine period at Priene (two churches, one of them devised out of the baths, and the other out of the Temple of Athena, and a late-period castle).

Sakçegözü. In 1907–11 J. Garstang explored several small artificial mounds on the plain around Sakçegözü. At Coba Hüyük, he discovered a small fortified neo-Hittite palace which occupied the full width of the mound. The palace was located in the northeast corner of the area inside the walls, furnished with bastions set at regular intervals; its entrance was decorated with figured orthostats and a central column resting on a finely sculptured base in the form of matching sphinxes. Another series of orthostats adorned the gate set into the walls. There were other buildings along the northwest side which opened onto the courtyard occupying most of the space inside the walls to the south. Various phases in the building of the palace have been determined. The most interesting aspect is offered by the reliefs, which, while remaining within the sphere of neo-Hittite art, show strong Assyrian or Aramaic influences. The carvings have been dated from the middle of the 8th century B.C. Particularly important is the relief on the city gate (now in Berlin, Staat. Mus.) showing a hunting scene which probably had some religious significance. Also unusual is the fact that the action unfolds not on one slab (as was normally the case) but on three. In the earliest levels, first explored by Garstang and examined in 1949, the sequence of cultures also turned out to be richer; ranging from the pre-Halab Chalcolithic period, through various successive phases, to the so-called "Habur" period, after which there is a jump to the 1st millennium B.C., and then to the classical period, 4th–1st century B.C. The site was again inhabited during the Middle Ages.

Sardis. This Lydian city, situated on the slope of a steep hill and served by the waters of the Paktolos and the Hermus, was already inhabited in neolithic times. It became, under Croesus (560–546 B.C.), the capital of the kingdom of Lydia and, from 546 B.C., the seat of an important Persian satrapy. Seriously damaged during the Ionian revolt (499 B.C.), it remained a Persian metropolis up to the Macedonian conquest (337 B.C.), after which it became a part of the Seleucid and (188 B.C.) Pergamene kingdoms. Incorporated into the Roman province of Asia (133 B.C.), it enjoyed great prosperity until it was sacked by Khusrau II during his two campaigns (A.D. 615–17). Going into a rapid decline, it continued to languish until the 15th century when the acropolis, the last inhabited part, was abandoned as

well. American excavators (active 1910–15 and from 1958 to the present) have brought considerable remains to light, and have established the long history of the site. The remains of the walls, dating from the 5th century B.C. (quite a large expanse of them still stand on top of the acropolis), frequently built over early foundations or embodying sections of earlier walls, are not particularly conspicuous. The most important monument is undoubtedly the sanctuary of Artemis, an ancient architectural complex rebuilt after the destructions brought about by the Ionians, with various additions and restorations dating from Roman times. The temple is Ionic pseudodipteral with 8×20 columns, a long amphiprostyle cella, an adytum and an opisthodomos; and a structure of archaic type, possibly the earlier altar, stood against the east façade. As to the Hellenistic-Roman city, which extended over the plain, what is known are the remains of a theater, a stadium, and an edifice with large pillars (thought to have been a gymnasium), as well as several sections of the walls. Recent explorations have proved that Butler's Building B (a great hall, 400 ft. long) was a gymnasium dedicated to Lucius Verus; along the east side, a large rectangular peristyle was connected to the long hall of Building B by a smaller courtyard with rich marble decorations, dating from the reign of Caracalla, while to the southwest was a porticoed street with shops (one of them identified as the workshop of a bronze founder). The discovery of a synagogue (A.D. 220–50, with restorations dating from the end of the 4th cent. A.D.), a long tripartite structure devised out of the rooms of a gymnasium, and the excavation of a rich early Christian house ("House of Bronzes"), are also of the greatest interest. Numerous burial mounds on the other side of the river (Bin Tepe, the thousand hills) constituted the Lydian necropolises, most of which were, unfortunately, plundered in ancient times. The other necropolises contain, aside from a number of painted early Christian tombs, an important mausoleum on steps, probably dating from the Persian period, and the chamber tomb with colonnaded *prothyron* of Claudia Antonia Sabina (A.D. 185–95), where parts of a fine sarcophagus of the Sidamara type have been found. Important, lastly, is the architectural terra-cotta work which has come to light during excavations and which formed a part of the protective decoration of private houses, as at Gordion and Pazarlı.

The remains of Byzantine churches are rather insignificant; one of the churches, of extremely modest dimensions, stood behind the Temple of Artemis, and another, very large and originally vaulted, in the valley. A third church has recently been discovered.

Side (mod. Eski Antalya). This was a colony founded near the Aeolian city of Cyme (7th cent. B.C.) along the shores of the Antalya Gulf, on a site already inhabited at the beginning of the 1st millennium. Conquered by Alexander the Great in 333 B.C., in the wars between Rome and Syria (197 and 190 B.C.) it was allied with Antiochus III and was later incorporated in the Roman state. It

Side, archaeological plan. Greek and Roman constructions: (1) main harbor; (2) small harbor; (3) walls; (4) main gate; (5) entrances; (6) porticoed streets; (7) arched gate; (8) agora with round building (probably a temple); (9) theater; (10) "Temple of Dionysios"; (11) temples; (12) building on podium (almost certainly a temple); (13) peristyle with hall of the imperial cult; (14) bathing establishment, now converted into a museum; (15) "harbor baths"; (16) Vespasian monument; (17) fountains; (18) aqueduct; (19) private houses; (20) water tank; (21) nymphaeum. Byzantine constructions: (22) walls built by Philippus Attius; (23) porticoed street; (24) basilica; (25) basilica with cruciform domed church added later; (26) cruciform church with dome; (27) sacred area; (28) nymphaeum; (29) secular building; (30) house; (31) baths (*from A. M. Mansel, 1963*).

CC-0. Agamnigam Digital Presevation Foundation, Chandigarh

was immensely prosperous in imperial times and continued to thrive up to the time of the Arab invasions (8th cent. A.D.). The rather large inhabited center was protected by turreted rubble walls which skirted the coast of the peninsula, then cut across the promontory; the inner face of the mainland walls was divided into three stories with two galleries and arrow slits. In the 2d century A.D. a lavish nymphaeum was built outside the old city gate; it consisted of three niches decorated with three superimposed architectural orders (more than a hundred columns), while two orders of open colonnades projected foward at either side of the pool. Inside, the gate opened into a hemicycle, also decorated with two superimposed orders of marble colonnades, giving access to two porticoed streets built in Roman times, one leading south, the other, considerably longer, toward the theater where, passing under an arch, it continued up to the top of the promontory, not far from the harbor. The theater is mostly Roman with substructures and vaulted passageways and a rich *scaena* with two stories of great marble colonnades; directly behind the stage was a porticoed agora with shops around three sides and a monumental columned entranceway off the street. In the open space was a small round temple (peripteral tholos with 12 Corinthian columns and a domed vault decorated with the signs of the Zodiac). Another quadriporticus (so-called "Building M") served three large rooms set along one side; the middle room, used for the cult of the emperor, opened onto the courtyard by means of a large colonnade surmounted perhaps by a pediment; the three inner walls of the room were decorated with niches and two superimposed orders of small marble columns. A 2d-century imperial statue was found in the central niche, images of gods in the others. The two rooms on either side were triple aisled with upper galleries. Another monumental center next to the harbor consisted of two peripteral Corinthian temples (6×11 columns) placed side by side (1st cent. A.D.), one dedicated to Athena, the other to Apollo. Still another smaller Roman temple with a semicircular cella stood at the end of the porticoed street. Equally important are the tombs, most of all the mausoleum in the form of a prostyle temple set in a large porticoed courtyard, outside the city walls (end of the 3d cent. A.D.); other tombs are interesting because of their structure, with sail vault or brick domes, or because of the magnificent sarcophagi they have yielded. A baths structure has recently been excavated and converted into a museum; two others, near the harbor, have yet to be investigated. The remaining classical monuments in Side are of lesser importance: private houses with peristyles, architectural structures that date from Hellenistic and late Roman times, fountains and ornamental buildings; of particular interest is the fountain with niche and colonnades near the theater dedicated to Vespasian. There are also remains of a Roman aqueduct.

The monuments dating from Byzantine times are equally important. At about the end of the 4th century another wall, furnished with towers, was built inside the city, branching off from the *scaena* of the theater. At the same time, numerous Christian churches were built. These include the cathedral (5th cent.), a five-aisled (later reduced to three) basilica with interesting subsidiary buildings for baptismal ceremonies, and the "Harbor Church," a complex basilica with the remains of two pagan temples incorporated into the atrium. There are other small churches near the cathedral and the remains of the bishop's palace have been identified south of it.

Sivas (anc. Sebastia, or Cabira). This was the imperial Roman city of Sebastia, of which no monuments remain, and was elevated by Justinian, who restored the fortified walls, to the position of capital of the province of Armenia Prima. After being fought for by the Byzantines, the Armenians, and the Persians, it was conquered by the Seljuks at the end of the 11th century. It then became the capital of the Danismen emirs, from whom it was once again seized by the Seljuks. It finally became a part of the Ottoman Empire, but it never recovered from the blows received, and it has remained an impoverished village. The Seljuk monuments, however, are worthy of note. Among them, the Gök Medrese (Blue Madrasah), the Bürciye Medrese and the Çifte Minare Medrese were all built at the same time (1271–72). The entrance of the Gök Medrese is in the form of a large niche adorned with stalactites and set into an elegantly decorated frame with two flanking minarets jutting out at either end of the façade. The ornament of these is constituted by tiles (once enameled) placed so as to form a network of lozenges; marble reliefs on the entrance are in the form of animal heads. The inner courtyard, with a fountain in the center, has porticoes around the sides. The Büriciye Medrese consisted of four wings set around a courtyard. Nothing but the façade of the Çifte Minare remains: it is lavishly, but harmoniously, decorated. Other monuments in Sivas worth mentioning are the Mausoleum of Hasan Bey (1347), a round structure with brick walls, and the largest known Seljuk mental hospital (1217), which also served as a medical school. The only remaining part is the hospital proper, but it is in ruins. The group of buildings was built by Izzettin Keykavus I, whose tomb stands nearby.

Smyrna (mod. İzmir). The city, situated at the mouth of the ancient Hermus, was founded, according to the sources, by the Leleges and subsequently taken over by Aeolian settlers (11th cent. B.C.) and then passed into the possession of Ionian settlers from Kolophon (9th cent. B.C.). At the beginning of the 6th century B.C., it was captured and razed to the ground by Alyattes, the king of Lydia, who prevented its reconstruction. Only at about the end of the 4th century B.C. was the new city of Smyrna built through the efforts of Lysimachus on the slopes of the Pagos (now Kadifekale, and which thus became the acropolis of the new city), about 5 miles from the ancient city (now Bayraklı). The new city flourished under the Seleucids and even more so under the Attalids; its lavish prosperity did not diminish in Roman times; on the contrary, favored as the city was by many emperors, it appreciably increased. In A.D. 178 it was almost completely demolished by an earthquake and immediately rebuilt by Marcus Aurelius at the insistence of the rhetorician Aelius Aristeides. Its importance grew again during the late Roman Empire and during the Byzantine period, to the detriment of Ephesus and despite repeated Arab invasions. Conquered by the Turks in 1076, it again became a Byzantine possession in 1097. It was then administered by the Genoese up until 1320, when the Turks regained possession for a second time, this time definitively, except for the brief overlordship of the Crusaders and the even briefer reign of Tamerlane. Though devastated by earthquakes in the 17th and 18th centuries, it remained one of the most important Anatolian cities. Several outstandingly important parts of the ancient city of Smyrna (Bayraklı) have come to light, namely a temple from the 7th century B.C., and in the vicinity of Bayraklı, the remains of a round structure known as the "Tomb of Tantalus." Not much is known about the Hellenistic-Roman city of Smyrna, over which the modern city has been built. There are, even so, important ruins of the agora with porticoes and shops around three sides (the west side is well-preserved) and a large Roman basilica on the fourth (north side). This basilica, particularly rich in marble decoration, consisted of a nave and two aisles and was supported by a series of vaulted substructures (well preserved). There are, moreover, a few remains of a theater and a stadium, while several sections of the walls would seem to date from Hellenistic times, despite many rectifications and changes undertaken in the Middle Ages. In the valley, some three miles southeast of the city, there are remains of three large Roman aqueducts, much restored by the Byzantines and Turks.

The modern city of İzmir has been considerably developed. The International Fair pavilions, standing in a magnificent park, are designed in keeping with the dictates of the international style of architecture.

Soğanlı (Soğanlı Dere). This is the second most important group of rock-cut churches in Cappadocia and is situated in a deep and secluded valley. Generally speaking, the architectural types are the same as in Göreme: the churches are of one, two or three aisles with barrel vaults and apses at the far end or with a central dome and the four arms of a cross. In some cases (the churches of the Belli Kelise group, for example) the outside of the cone of rock has also been chiseled into the form of a dome. There are also numerous remains of frescoes, but they are in great disrepair. The only constructed church, Akkilise, has fallen into almost total ruin and its frescoes have been damaged; most of the churches are now used as pigeon cotes.

Tarsus (mod. Gözlü Kule). When it was investigated by American archaeologists down to its earliest levels, the Gözlü Kule mound yielded an important series of finds covering the period from the Neolithic Age to the Roman period which have enabled archaeologists to piece together the data furnished by Mersin, especially with regard to that period from the end of the Chalcolithic Age to the beginning of the 2d millennium, thus making it possible for a complete picture of Cilician culture to be drawn. The Middle and Late Bronze ages, which are well represented, show the rise of the Kizzuwatna kingdom (of which Tarsus was probably the capital or, at least, an important center), its inclusion into the orbit of the Hittite empire, and, after the 12th-century destruction of the inhabited center, the presence of Mycenaean tribes (as was the case in the not-far-distant island of Cyprus). Very few changes took place in the Iron Age; the population was conservative and rather isolated. After the destruction effected by Sennacherib in 696, the city flourished once again, but there are very few Hellenistic and Roman remains. The famous monuments have all disappeared; only the bare truncated ruins of an archway — the so-called "St. Paul's Gate" — still stand. The Moslems took possession of Tarsus in A.D. 680.

Tekor (Digor). This village in the Ani region contains the ruins of an Armenian basilican church (5th cent.), rebuilt at the end of the 5th–6th century in the form of a domed basilica. The dome (destroyed in 1911), devoid of a drum, was the oldest dome of this kind in Armenian architecture. The building was cubic in structure on the outside with a faceted pyramidal roof.

Termessus. A Pamphylian city, 3,445 ft. above sea level on the slopes of the ancient Mt. Solymos, Termessus lies about 20 mi. (as the crow flies) from Adalia (Antalya). Its origins are unknown; it is mentioned for the first time in 334 B.C. in relation to the expedition of Alexander the Great, and in the succeeding Hellenistic period it enjoyed a fair amount of independence within the Pergamene kingdom. During the 3d century B.C. its rulers founded a colony known as Termessus Minor, situated near Oionoanda on the banks of the Xanthus in southwestern Pisidia. An ally of Rome in the wars against Antiochus, it was to regain its independence at the time of the wars against Mithridates (72 B.C.). Termessus continued to prosper until the 3d century A.D.; in the late Roman and early Middle Ages, the city went into a decline and by the 7th century it was completely deserted. The city, extremely well protected by its natural position, was fortified only at the points of easiest access; these various lengths of wall, furnished with several gates, were built at different times (the main sections date from the 2d cent. B.C.). Most of the public monuments, the agora, and shops were located in the western part of the city, and most of the numerous temples were located in the southeastern part. Architectural fragments and parts of a frieze with gigantomachy inspired by Pergamene art (2d–1st cent. B.C.) are all that remain of the Doric temple of Zeus Solymaeus. Only a few ruins are still standing of a large Hellenistic peripteral temple with 6×11 Ionic columns, pronaos *in antis* and a cella without opisthodomos: a frieze with representations of the myth of Iphigenia has been found and probably belonged to it, so that the temple is very likely to have been dedicated to Artemis. Dating from Roman times is the typical prostyle hexastyle Corinthian temple (of Asclepius and Hygieia?) with a so-called "Syrian" pediment and a cella with apse (Antonine period), the nearby small prostyle tetrastyle Corinthian temple set on a high podium (also Antonine), and the prostyle tetrastyle Temple of Artemis which stood near the odeum and of which only the walls of the cella (Severan period) remain. The theater and the odeum, both well preserved and distinctive, are very important. The theater, apparently Augustan in origin, stands on the mountainside east of the agora; the cavea consists of two *maeniania* divided into five *cunei* and the stage structure has five apertures (now framed by pairs of Corinthian columns surmounted by a continuous architrave. The odeum (ca. A.D. 200) south of the central gymnasium was a large hall with slightly curving tiers of seats; it was entered on the valley side and the windows were separated by pairs of Doric parastades. There were two gymnasiums in the city, one central (poorly preserved) overlooking the agora, with a large porticoed palaestra (1st cent. A.D.), and one to the northwest, typical of Asia Minor in its plan, with consecutive rooms and a rich façade decorated with niches (A.D. 220–30). There are numerous remains of Hellenistic-type dwellings with peristyles, dating from various periods of the Roman era (e.g., the house of Ktistes). The necropolises, north and south of the city, with rock-cut tombs or small heroa containing large sarcophagi (typical, the heroon of Mamastis dating from the 2d century A.D., set on a high podium with a small broken pediment supported by four Corinthian columns and a cella holding the sarcophagus) are extremely interesting. North of the city, at the top of a flight of steps, are the remains of a propylaeum dedicated to Hadrian, consisting of an architraved gate preceded by a pair of Corinthian columns terminating in pilasters.

Trabzon (anc. Trapezous; former Trebizond). The ancient city of Trapezous was founded toward the end of the first half of the first millennium B.C. by Greek settlers from Sinope. At the beginning of the 5th century, it grew into an important commercial center; the road which led across the mountains of Armenia, connecting the Black Sea and Persia, started there. Captured by the Romans in the 1st century B.C., it was considerably enlarged and embellished by Hadrian, who also built a new artificial harbor. In Byzantine times, Justinian set about strengthening the fortifications. In 1204, after Constantinople fell into the hands of the Crusaders, Trabzon became an imperial seat. In 1461, it fell to the Turks. The city is divided into an old upper city, still enclosed by the ancient bastions, and a new city which spreads from the bastions to the harbor. The old city contains several important monuments: the upper citadel with *enceinte* walls dating from the time of the Comnene dynasty and, inside, the remains of the imperial palace; the ancient church of Panagia Chrysoképhalos (now a mosque, the Ortahisar Cami), a Latin-cross building changed into its present form probably in the 13th century, when the dome over the crossing and the narthex with a loggia were built (the dome was covered with sheets of gilded bronze, whence the name of the church); the basilican church of Hagia Sophia, built a little after 1204 and later changed into a cross-in-square domed church (1248–63), when the three atriums (north, south, west) were added. In the south atrium are the remains of rather crudely executed sculptures with epic representations of ancestors. Byzantine fresco cycles are to be found inside. Located outside the bastions are the church of St. Anne, with three apses, dating from the beginning of the 8th century, then modified, according to an inscription, in 884–85; the church of St. Eugenius (now the Yeni Cuma Cami), it too with three apses and with a dome (built later) over the crossing (after 1340).

Troy (anc. Ilium, Trūva; mod. Hisarlık). Excavations were begun by H. Schliemann (1870–90), were continued by W. Dörpfeld (1893–

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

94), and were resumed by the University of Cincinnati, under the guidance of C. W. Blegen, between 1932 and 1938. Schliemann's credit lies in having identified the site of the Homeric city, or rather its acropolis, as the Hisarlık mound, within the precincts of the Temple of Athena, and in having distinguished its various phases. The American excavations, while admirably completing the data already obtained and solving a number of extremely important problems, have not brought about any substantial changes in the general outlines. All told, nine cities, subdivided into 46 distinct subphases, have been identified. From its foundation, Troy had been a fortified stronghold at an important crossroads between Europe and Asia; its culture was clearly northwest Anatolian in origin (antecedents at Kum-Tepe). The so-called "Treasure of Priam," discovered by Schliemann and probably hidden just before the destruction took place at the end of the period, is to be ascribed to Troy II, a much larger city in size, whose elaborate fortifications were frequently altered. Troy III, IV, and V follow the same sequence of cultural development which distinguished the Early Bronze Age of Troy; they were not, in any case, merely poor villages, as some authorities have maintained. Troy VI, built by a new population, flourished in the Middle and partly in the Late Bronze Age, showing gradual and considerable growth; the original area more than doubled and city walls were built of dressed stone. The conquest of the city by the Homeric heroes apparently took place at the end of that phase known as Troy VII A. From that moment on, the city failed to recover its former prosperity. During the Late Bronze Age, a very noticeable Mycenaean influence is found which epitomized all those cultural and commercial relations within the Aegean that distinguished Trojan culture from its very inception. Even so, both recent and earlier excavations have brought considerable remains of the Hellenistic-Roman city to light: among them, the Temple of Athena, of archaic origin, but extant in a late Hellenistic (or, according to better-grounded opinion, Augustan) form (it is a Doric peripteral temple with 6 × 12 columns, preceded by propylaea built in Roman times); two theaters, the smaller one better preserved; and a Roman amphitheater and baths. These are tangible evidence of the favor showed by the emperors towards what was considered the mother city of Rome.

Van. An eastern Turkish city, the seat of a vilayet, now stands on the shores of the lake of the same name. During the first half of the first millennium B.C., it was the capital of the Urartu kingdom which, with varying success, held out against Assyria. Near the modern city, there are three sites of particular interest: Vankale, the actual acropolis of the city, upon whose southern slopes flights of stairs and rooms are carved out of the rock (probably the monumental sepulcher of Argishitis I, r. ca. 789–766, and his family); Samiramalti, or Tilkitepe, a small artificial mound, standing southwest of the city; and Toprakkale, about 4 mi. west of the city, built on an outcrop of the hills whose steep sides make it a natural, almost impregnable fortress. It is this site which has yielded the most interesting finds. Following a series of accidental discoveries in 1879, H. Rassam worked the site on behalf of the British Museum and found the famous bronze shields with animals arranged in concentric bands and edged with cuneiform inscriptions, as well as other material. In 1898 Belck and Lehmann-Haupt resumed excavations of the acropolis along scientific lines and uncovered the Temple of Khaldis, which had already been explored by Rassam but from which they dug further material (later identified as temple furnishings; aside from the shields there were a throne and a stool trimmed in metal, bronze bowls, and candelabra, extremely helpful in providing a clearer idea of Urartian art, which proved to be greatly influenced by Assyrian art). Inside the temple (about 67 ft. by 44 ft.) was a square base, 14 ft. by 14 ft., which probably held the statue of the cult, and in front an open clearing some 65 ft. on each side, decorated with a geometric mosaic in black and white stone. Storerooms and houses for the priests were set around the temple. The foundations built of stone blocks, varied in depth according to the lay of the land. As to the citadel, it has been possible, on the basis of the inscriptions, to ascribe both it and the temple to Rusas I, though the temple, in its final form, was the work of Rusas III (ca. 605–585). The materials may be said, therefore, to date from the 7th century B.C. Toprakkale, or Rusahina, from the name of its founder, was probably destroyed by the Medes under Cyaxares in 585. In 1913 the Russian archaeological expedition headed by Marr and Orbeil worked at Toprakkale, uncovering a temple carved out of the rock at the foot of the hill, with an inscribed stele still standing in its cult niche.

Xanthus (mod. Kınık). The most important city of Lycia, Xanthus, was set on two hillocks overlooking the Xanthus River. A Lydian possession until 545 B.C., it fell into the hands of the Persians, under whom it very quickly gained what was, to all intents and purposes, independent status. Conquered by Alexander, it became subject to the Seleucids and in 188 B.C. to the Rhodians. In 167 B.C., it freed itself from the Rhodians and later entered the Roman orbit as a free city. It enjoyed considerable prosperity in imperial times, but with the decline of Byzantine power it was completely abandoned. Numerous remains of the classical city were brought to light by English excavators in the last century and during the recent French explorations. The city walls include polygonal and isodomical stretches with monolithic corner stones (5th and 2d cent. B.C.), as well as sections dating from a late period (possibly Byzantine), distinguished by an extensive use of rubble. Remains of Roman gates have been found.

Xanthos, archaeological plan with indications of Greek, Roman and Byzantine monuments: (*a*) walls; (*b*) Hellenistic gate; (*c*) Lycian acropolis; (*d*) Roman acropolis, with Byzantine monastery built over a Roman temple; (*e*) Roman agora; (*f*) Roman theater; (*g*) funerary tower; (*h*) pillared sarcophagus; (*i*) "Harpy Tomb"; (*j*) Hellenistic necropolis; (*k*) polygonal wall; (*l*) funerary pillar with inscription; (*m*) the so-called "theater pillar"; (*n*) "Tomb of the Nereids". In the box: (*o*) the so-called funerary pillar of the acropolis; (*p*) sarcophagus of Payava; (*q*) sarcophagi; (*r*) rock-cut tombs; (*s*) Christian basilica (*from P. Demargne, 1958, completed by H. Metzger, P. Coupel, 1963*).

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

On the higher of the two hills ("Lycian acropolis") there is a vast terrace on the west side, upon which stood a building decorated with the frieze now in the British Museum; on the north side was a rectangular edifice with an adjoining enclosure containing an altar dedicated to Artemis (5th cent. B.C.); and on the southeast side there is a building (perhaps the royal palace), two phases of which have been identified, one (ca. 700–550 B.C.) with several rooms and the other (ca. 530–500 B.C.) distinguished by the presence of numerous secondary chambers (storerooms?) set around a central nucleus. In the depression between the two hills was to be found the Roman agora (2d cent. A.D.) with colonnades on all four sides and convex architrave. Particularly interesting is the double gate set in the east side connecting the large square with the main colonnaded street. Around the agora stand archaic tombs of the characteristic Lycian type, set on pillars (e.g., the "Harpy Tomb"); farther south is the theater, partially resting on substructures, with *frons scaenae* consisting of five rectilinear exedras, (2d half of 2d cent. A.D.); beneath the orchestra are traces of an earlier, possibly Hellenistic, theater.

In the east quarter can be seen the remains of a large Byzantine church to which was attached a building with a square courtyard, possibly the archbishop's palace. The Hellenistic-Roman necropolis northeast of the city abounds in the characteristic sarcophagi of the so-called "Lycian" type. There are the remains of a Byzantine monastery on the opposite hill.

Yazılıkaya (The Midas City). This city (not to be confused with the Hittite sanctuary of the same name, near Boğazköy) is situated southeast of Eskişehir, and was excavated by the French Archaeological Institute of Istanbul. It stands on a rocky mass whose level top is some 1,640 ft. long, at the center of an area strewn with Phrygian rock-cut monuments. There is proof that the site was inhabited before the arrival of the Phrygians. The latter settled on the acropolis in the second half of the 6th century, that is, after the Cimmerans had reached the central highlands; it is not, however, impossible that the fortifications of the citadel, and the stairs hewn out of the rock, date from the period when the Phrygian kingdom flourished, but in any case not earlier than the 7th century. A large quantity of gray Phrygian earthenware has been found. A second phase in the city's existence begins after the middle of the 6th century and ends in the second half of the 4th or the beginning of the 3d century. The inhabited center seems to have been suddenly abandoned under the imminence of some outside threat, possibly from the Galatians. Traces of several buildings have been found on top of the acropolis, among them a temple decorated with patterned terra cottas datable to the reign of Croesus. Signs of destruction may indicate that the city was captured by the Persians in 546, at the time of the conquest of Sardis. There is evidence of commercial contacts with the West during the 6th century. The channels of trade, opened during the Lydian domination, continued under the Persians. Standing on the hillside is the famous monument known as the "Tomb of Midas," consisting of a façade carved out of the rock in the form of a building with a ridged roof and decorated with elegant and intricate geometric designs in relief. Midas is mentioned in an inscription. Recent investigations have determined that it was a place of worship: underneath the façade is a subterranean chamber, and a nearby building was probably connected with the ritual ceremonies.

Yortan. A site east of Pergamum, Yortan has yielded an extramural necropolis akin to the culture of Troy I and II. The inhabited centers relative to these burial grounds, of which little scientific data is known, have not been discovered except for one mud-brick house with right-angle walls, uncovered at Ovabayîndir. The bodies, lying in a contracted position, were almost always enclosed in *pithoi* with the mouth facing east. Enclosures formed by stone slabs driven upright in the ground were sometimes found. The cist tombs are rare and perhaps date from a later period. The sacred furnishings, set in and round the *pithoi*, included metal objects (gold, copper) and ceramics with white ribbing and zigzag lines painted on a dark background. Certain features of Yortan culture are found, during the Early Bronze Age II, in the Beycesultan area; this makes it possible to definitely establish the life span of the culture in question as being contemporary not only with Troy I, but with Troy II, as well.

Zincirli. This was the capital of the Aramen state of Sam'al or Ya'udi, founded in the second half of the 10th century B.C. The most famous kings were Kilamura, who profited from the disorders following the death of Shalmaneser III (858–824) to enlarge the kingdom; Panamura I, whose inscription has been found on a statue of the god Hadad and who brought the kingdom to prosperity between the death of Adadnirari III and Tiglathpileser III (745–727); Barrekib, son of Panamura II, restored to the throne by Tiglathpileser III. After this period of vassalage no more mention is made of the state in the Assyrian annals, from the reign of Sargon II on; it was probably the seat of an Assyrian governorship until 676. Explored by German archaeologists, Zincirli has proved to be an essential link in the understanding of the art of those states improperly known as neo-Hittite. The city was fortified by a two-fold circuit of walls; the outer walls were doubled in Assyrian times and furnished with projecting bastions. Three double gates gave access to the inhabited area. The acropolis, surrounded by a wall and also reinforced by embattled towers, contained the most important buildings. Other internal partitions were built to strengthen the defenses. To the north and northwest were located public buildings, dating from various periods, their fundamental characteristic being that most of them were in the form of the *bît-hilani*: this was essentially a building consisting of an antechamber which was entered through a columned portico, a reception hall parallel to the antechamber, and several subsidiary rooms. The was no way for these buildings to be enlarged; when the need arose, another *bît-hilani* was built next to (but completely detached from) the first. Numerous sculptures, both in relief and in the round, attest to the art of the 9th and 8th centuries. The decorations on the south Gate A, with lions in full relief and carvings of mythical figures or scenes of every day life and those on Gate D of the inner wall may be ascribed to the reign of Kilamura. On this latter gate the lions are shown in low relief; also worthy of note is the representation of the storm god and the female divinity, Kubaba, holding a mirror in her hand. Also to be ascribed to this same first phase is the monumental statue of some royal or, in the view of some scholars, sacred personage, from Building J in the citadel, which shows peculiar iconographic and stylistic similarities with an analogous work from Carchemish. The second series of reliefs, found inside the citadel, may be dated to the reign of Barrekub. Here, especially in the reliefs of the king, of the scribe, and of the musicians, and on the stele of the queen, a greater technical refinement can be noticed and the spirit with which the subjects have been treated has become freer and less restrained. While borrowing Assyrian models and techniques, the reliefs do not lack originality. They represent the high point touched upon by the figurative arts in the late Hittite kingdoms under the pressure of Assyrian political power and of the obvious force of attraction generated by the more active Northern Mesopotamian centers.

European Turkey. Edirne (Hadrianopolis). Founded by the emperor Hadrian in A.D. 125 at the confluence of three rivers, the city was the center of communications between Thrace and the Bosporus. Except for the temporary periods of occupation by the Bulgarians and the Crusaders, it remained Byzantine until the Turkish conquest in 1361, when it entered a period of prosperity. First capital of the Ottoman Empire, it lost this rank after the fall of Constantinople, though it retained its importance and prosperity up until 1913 when, as a result of the Balkan wars, it lost the provinces which supported it and the population dwindled until the city was reduced

Edirne, plan of the center of the city. Principal monuments: (*a*) site of the Roman city (Hadrianopolis), reconstructed with dotted lines; (*b*) Muradiye Cami; (*c*) Gulbahar Cami; (*d*) Selimiye Cami; (*e*) Uç Serefeli Cami; (*f*) Eski Cami; (*g*) *bedesten*; (*h*) Rüstem Paşa Han; (*i*) Ali Paşa çarsısi; (*j*) Beyazıt II Cami; (*k*) Beyazıt Yıldırım Cami; (*l*) Sahnelek Cami and Gazimihal Cami.

to the size of a small town. Of the Roman-Byzantine city, all that remains is the checkerboard plan. There are, however, a number of important Ottoman monuments: the Yıldırım Cami; the Eski Cami; the Uç Serefeli Cami; the T-shaped Muradiye Cami; the Beyazıt Cami; and the Selimiye Cami, the great architect Sinān's masterpiece, built between 1569 and 1575 by Sultan Selīm II. There are also numerous ruins in Edirne of the ancient *hans* as well as of arcades for commerce and trade (for descriptions of above monuments, see OTTOMAN SCHOOLS; SINĀN).

Istanbul (Byz. Constantinople). The name Istanbul had appeared in the form Stānbūl-Istānbūl in the writings of 10th-century Arabian authors. It entered into common usage after the Turkish conquest (see OTTOMAN SCHOOLS) along with the official form, al-Qusṭanṭīniyyah, Qosṭanṭīniyyeh. A Megarian colony founded about 660 B.C., it took part in the Ionian revolt of 496 B.C. Reoccupied by the Persians, it was delivered by Athens and became a member of the two Delian Leagues. As an enemy of the Macedonians, whose attack it resisted, the city was a faithful ally of Rome until the end of the 2d century A.D., when it was razed to the ground by Septimius Severus for having supported Pescennius Niger.

The original city occupied only the promontory, which contains the ancient palace of the sultan, Hagia Sophia, the Hippodrome, and the remains of the Byzantine Sacrum Palatium (Great Palace of the Emperors). The acropolis, the site of the imperial Ottoman palace, was protected by massive walls, now completely destroyed, while the inland walls of the city, destroyed by Septimius Severus, ran from the Propontis (Sea of Marmora) to the Golden Horn in the neighborhood of the Column of Constantine (the "Burnt Column"), where Roman tombs have, in fact, been found. Nothing remains of the Greek city, which abounded in temples and gymnasiums, or of the city which Septimius Severus built around the re-constructed Acropolis and the Hippodrome (completed by Constantine the Great).

Because of its highly strategic geographical situation, controlling both the Balkans and Anatolia, Constantine chose the city as his new capital. Reconstruction was begun sometime between 324 and 328, and the city was dedicated on May 11, 330. Constantine greatly enlarged the city, dividing it, like Rome, into 14 regions; he also built other walls much farther to the west (running from the present Atatürk Bridge to Isa Kapı Mesçiti), and constructed an imperial palace, a new forum, a praetorium, a capitolium, buildings for the quaestors and the senate, cisterns, baths, and possibly churches as well. All that remains of Constantine's building activities is the great column of prophyry drums which stood in the forum. The walls have completely disappeared and the Sacrum Palatium has also been destroyed; so far, except for a few scattered remains (architectural elements from the forum), none of the buildings has been proved to have been built by Constantine.

In the 4th century Constans II added baths and a library to the great group of buildings erected by Constantine; Julian the Apostate then had a large harbor built with a semicircular stoa, and Valens added several buildings for bathing and an elaborate aqueduct that solved the difficult problem of the city's water supply. Nothing remains of these constructions today except a part of Valens' aqueduct, a two-story limestone structure (much restored). Theodosius I (378–95) gave renewed impetus to the construction of monumental buildings; it was he, in fact, who had a new forum (Forum Tauri) built along the main street (the Mese) to the west of the Forum of Constantine and similar in plan to the Forum of Trajan in Rome, with a spiral column bearing reliefs of historical scenes, and a basilica; nothing remains of this great complex but a few bits and pieces of the decoration from the spiral column and elements from the substructures. Theodosius also built two new royal palaces (the Palatium Placidianum and the Palatium Flaccillanum; destroyed) and installed in the spina of the circus an obelisk from Heliopolis, which still stands on a marble base with low reliefs representing official events and ceremonies. Theodosius' son, Arcadius (395–408), had another forum built along the Mese, exactly like the one his father had built; nothing remains of this forum but the base of the spiral column. Also to be ascribed perhaps to the reign of Theodosius I or of Arcadius is the Arch of Taurus, with a single archway and four columns in the form of enormous Herculean clubs on every impost.

The capital enjoyed its greatest prosperity under Theodosius II (408–450), who greatly enlarged the city area, running a new and very strong wall along the east side (413) and completing the fortifications of the inhabited center by adding another wall along the coastline (439). These new walls enclosed an area so vast that over the centuries the city has never grown beyond the limits of these fortifications. The division into regions was kept, but the 10th, 11th, and 12th regions were greatly extended to include the additional space (the 14th region, traditionally associated with the suburb of Blachernae, became rather more identified with the Hebdomon, royal residence and military headquarters some seven miles from the city). The only remaining part of the works built by Theodosius II, aside from the portico of Hagia Sophia (excavated by A. M. Schneider in 1935) are the buildings excavated on the site identified as that of the imperial palace of the Boukoleion, which was, in fact, originally built by Theodosius II. These buildings included a large courtyard (obviously pertaining to the official quarter of the palatium) with four spacious colonnades (from 29½ ft. to 36 ft. long), which on the southeast side opened onto a large apsed hall preceded by a rectangular vestibule. Just what this group of buildings, adorned with large marble columns and an exceptional mosaic pavement with animals, grotesque scenes, and circus games on a white background, was used for has not yet been determined. The great rectangular Binbirdirek cistern, 210 by 178 ft., with 224 columns and domed crossings, was possibly also built by Theodosius. The Theodosian walls of the city are relatively well preserved, especially those facing inland; constructed with prodigious skill in 413 under the direction of the praetorian Antemius, they consisted of high, strong curtains with protruding towers preceded by a second, lower wall for the archers, it too provided with towers. A deep moat was dug along the double line of walls. The "marble tower," on the cape toward the Sea of Marmara, and the Blachernae fortress (which was to play such an important role in the final centuries of the Empire's existence) on the other cape facing the Golden Horn, served as the two pillars of this line of defense. Among the various gates, which were generally flanked by two towers, the Golden Gate was monumental in character; still standing are the two large tower bases, covered with finely laid marble blocks, and the section between the towers with three large archways, decorated with piers with Corinthian columns and surmounted at one time by a dedicatory inscription and bronze statues.

The topography of the Theodosian city, despite the abundance of literary sources, is largely unknown (very little of it remains).

CC-0. Agamnigam Digital Preservation Foundation, Chandigarh

The original main streets can only be detected by means of the ancient sewage system, parts of which occasionally come to light (e.g., under the Divan Yolu).

The post-Theodosian city was enhanced mostly by Christian churches, of which there had been very few up until 440; the *Notitia urbis Constantinopolitanae* lists twelve: ten in the city, one at Galata and one at Hebdomon. The most interesting of the old churches, also in terms of its preservation, is the monastery church, St. John in Studion, which was built in the vicinity of the Golden Gate in about 463. The church, now in ruins, was a large basilica with an apse that was semicircular on the inside and polygonal on the outside; there were galleries along the aisles. All that remains are the encompassing walls, the shafts of the verde antico columns of the central nave, remains of the bases of the capitals and of finely worked white marble architraves (see II, col. 762). Among the other early Christian buildings is the Martyrium of SS. Karpos and Papylos (early 5th cent.), a circular structure situated near the monastery of Studion. Nothing remains of the public monuments of this period, except the Column of Marcianus (decorated base) and the great cistern (near the Sultan Selim Cami) which most scholars identify as the Aspar water tank.

The Hippodrome, whose original structure dates from the great restoration effected by Septimius Severus, was given its final form perhaps at the end of the 5th century; at that time it was enlarged and altered. It was possible to get a clearer idea of the monument's structure after the discoveries made in 1952; some 1,560 ft. in length, it was built of brick, with steps faced with marble slabs. Set along the spina were works of art which included, aside from the obelisk of Theodosius the Great and various fountains, the bronze tripod of Delphi and a second obelisk sheathed in bronze plates; the Diippion, that is, the starting gallery, seems to have been surmounted by a quadriga drawn by the four bronze horses which are now in Venice (S. Marco). Among the commemorative columns the oldest is perhaps the one which stands in the gardens of the Topkapı Saray (Claudius II or Constantine the Great); the column of Constantine the Great consists of superimposed drums of porphyry, ornamented at the joins by bands of laurel leaves. All that remains of the column of Arcadius, as mentioned above, is the base. The column of Marcianus, on the other hand, quite well preserved, is enhanced by a rich Corinthian capital; the base has two Nikae with the laurel crown and chrismon.

During the reign of Justinian (527–595) most of the city was destroyed in the terrible Nika riots (552), but the Emperor provided generously for its reconstruction.

The richest Byzantine churches of the city date from the reign of Justinian. They include SS. Sergius and Bacchus (Küçük Aya Sofya Cami) built by Justinian (527–36) and converted into a mosque during the time of Beyazıt II; it is a square building with inscribed octagon formed by the columns supporting the dome; the peribolus has two stories. The narthex, the six-columned portico and the minaret were added by the Turks. The "Great Church," Hagia Sophia (dedicated to the Divine Wisdom), was originally built in 325 by Constantine on the ruins of a pagan temple, was enlarged by Constans, reconstructed by Theodosius II after the fire of 495,

Constantinople, archaeological plan over the general outlines of the modern city of Istanbul. The walls: (*A*) of Septimius Severus, (*B*) of Constantine, (*C*) of Theodosius II; (*D*) so-called "Mese Street"; (*E*) aqueduct of Valens. Main areas, buildings and monuments of historical and artistic interest: (*1*) Egnatia Street; Gates: (*2*) Golden, (*3*) Xilo Porta (Wooden Gate), (*4*) Pigi, (*5*) so-called "Sigma," or Garikaji, (*6*) Polyandros, (*7*) St. Romano, (*8*) Pempton, (*9*) Charisio or Hadrianopolis, (*10*) royal palace; Harbors: (*11*) Eleutherios, (*12*) Theodosius I; (*13*) Julian (later "Sophia"), (*14*) Boukoleion, (*15*) Kontoskalion; (*16*) site of the acropolis of Greek Byzantium; (*17*) site of the agora, later known as the Augustaion; (*18*) site of the Zeuxippos baths; (*19*) site of the Palatium; (*20*) site of the Philadelphion; (*21*) site of the Amastrion; (*22*) column of Eudoxia; (*23*) column of Claudius the Goth; (*24*) hippodrome; (*25*) site of the Forum of Bovis; (*26*) site of the Constantine Forum and column; (*27*) site of the Theodosius I Forum (Forum of Tauri), arch, column; (*28*) site of the Arcadius Forum and column; (*29*) column of Mercian; (*30*) Blachernae Palace; (*31*) Rotunda of Mirelaion; Water tanks: (*32*) Phifoxene, (*33*) Hagio Mokios, (*34*) probably the nymphaeum of the aqueduct of Valens, (*35*) Aspar, (*36*) Aetius, (*37*) St. Euphemia; (*38*) churches; (*39*) Hagia Sophia; (*40*) St. Irene; (*41*) Theotokos Chalkopatria; (*42*) SS. Sergius and Bacchus; (*43*) Holy Apostles; (*44*) SS. Karpos and Papylos; (*45*) St. John in Studion.

and rebuilt by Justinian (the work was finished in 548) after the fire of 532. It is this last, 6th-century structure, designed by Artemisius of Tralles and Isidore of Miletus, which remains intact today. The dome, which collapsed in 559, was immediately rebuilt on a smaller scale and reinforced on the outside, and then restored in 1374. In 1453 the church was converted into a mosque, and the four minarets, the mihrab, and the great candelabrum beneath the dome were added. Since 1935 the church has been a museum. The building consists of an atrium (remains), an exonarthex and a narthex which lead into the spacious triple nave surmounted by an immense central dome. Women's galleries run along the side aisles and communicate with the loggia of the narthex. The apse is semicircular on the inside and polygonal on the outside. Polychrome marbles, mosaics, carved capitals, and friezes line the inner walls of the building. The aniconic mosaics (especially striking, the large jeweled crosses) date from the time of Justinian, and the ones with figures from the period following the iconoclastic movement. There are gilded bronze doors from the 6th century, and one from the 9th century. The baptistery, standing to the right of the church and square on the outside and octagonal on the inside, was built after the present church of Hagia Sophia; it was later converted into a turbeh. The Byzantine church of St. Irene, said to have been founded on the site of a pagan temple consecrated to Aphrodite, was destroyed in the Nika revolt and reconstructed by Justinian, then largely rebuilt in the 8th century. It is a basilica with two domes and women's galleries. The building was preceded by an atrium and a two-storied narthex. Part of the mosaic decorations from the iconoclast period (large apsidal cross) are still visible (see II, col. 780).

During the 7th and 8th centuries, the Arabs repeatedly laid seige to the city. In 754, iconoclasm led not only to the destruction of images in religious buildings, but also of many precious objects with figural decoration in the field of the lesser arts. In the 9th century, with the end of the iconoclastic period and the rise of the Macedonian dynasty, Constantinople became, for the second time, a political and religious center of the greatest importance. In the 12th century, internal dynastic strife facilitated the interference of the Crusaders into domestic affairs; Constantinople fell into their hands in 1204 and was sacked. The Latin Empire was established, but lasted only up until 1260, when, with the help of the Genoese, Michael VIII Palaeologus reconquered the throne for the Greeks. The empire was subsequently the throne for the Greeks. The empire was subsequently weakened by continual warfare, and fell into the hands of the Turks in 1451. Almost all the churches were then converted in mosques, and minarets were added.

During this period many churches were built, whose exact dates are often difficult to establish. Generally speaking, they were in the cross-in-square form. Among the most important are the Bodrum Cami, perhaps the church of the Myrelaion convent, built by Romanus Lecapenus (920–44); St. John Prodomos ("in Trullo"), a small church with a dome set on a high drum, in ruins; Eski Imaret Cami, the ancient St. Saviour Pantepoptes, a monastery church founded by Anna Delaena, mother of Alexius Comnenus I (1101–18); and the Kalender Cami, possibly the monastery church of Akataleptos, mentioned after 1086. Another Byzantine complex, the Mollazeyrek Cami, consists of two churches with a funerary chapel in the middle. The southern church was dedicated to Christ Pantokrator, and seems to have been begun in 1124 and finished in 1143; the other, a more recent one, was dedicated to the Virgin Eleousa (the Merciful). Particularly interesting in the southern church is the handsome *opus sectile* marble floor, recently restored. Gül Cami, a church of unknown origins, was named in the 14th century after St. Theodosia, a martyr of the iconoclastic persecutions. The Kilise Cami, identified more or less arbitrarily with St. Theodore, appears to have been built, judging by the style, in the 12th or 13th century; the exonarthex is more recent and contains an interesting series of 14th-century mosaics. Koca Mustafa Paşa Cami, the ancient monastery church of St. Andrew in Krisei, was probably built by Theodora, the niece of Michael VIII, in 1284. Fetiye Cami, the ancient Theotokos Pammakaristos, was built about 1300 by Michael Glabas Tarcaniota, with a funerary chapel added slightly later by his wife.

Among the secular buildings, mention should be made of two ruined palaces, one on the walls toward the sea, near SS. Sergius and Bacchus, known as the "Palace of Justinian," but dating from a more recent period (perhaps 10th cent.) and one on the inland walls adjoining the Blachernae enclosure; the Tekfur Saray, traditionally known as the "Palace of Constantine," different in style from the earlier imperial palaces, with polychrome walls of brick and limestone arranged in a checkerboard fashion, stripes and various patterns, and dressed stone archways, also polychrome. Because of the polychrome work, the palace would seem to date from the time of the Palaeologi. Rectangular in plan, it is built on three stories with a portico on the ground floor and large halls on the upper two.

After the Turkish conquest of Constantinople, the city became the favorite of the sultans, who made it, as Istanbul, the most beautiful and richest capital in the Near East. The most important mosques were erected on the crests of the hills which constitute the spine of the city, so that Istanbul, at one time a conglomeration of small houses and gardens, came to be dominated by the domes and minarets of the magnificent imperial mosques, which gave the skyline of the city a distinctive and picturesque character of its own (For a description of the principal mosques of Istanbul, see OTTOMAN SCHOOLS; SINĀN.)

Also commendable in every way is the Turkish civil architecture of Istanbul, starting with the various palaces of the sultans. The first Ottoman monarch, Mehmet II Fatih, built his place of residence, now destroyed, in the Taurus district (Eski Saray, the old palace; 1454–58), and a second palace (Saray-i-cedit) on the ancient acropolis of Byzantium, next to St. Irene's, inside the city walls. This latter palace, enlarged and modified, constitutes the nucleus of the present-day Topkapı Saray complex (see X, col. 865).

The 19th-century Ottoman rulers abandoned the Topkapı Saray in favor of other European-style palaces located in the eastern quarter of the city, on the other side of the Golden Horn. These were Dolmabahçe (1853) and Yıldız. The Dolmabahçe Palace is a sumptuous example of the neoclassic style which was used in Istanbul around the middle of the 19th century, overloaded with marble and stucco decorations, yet, even so, reflecting a rich and vivacious taste; built at Besiktas for Abdülmeçit by the architect Balian, it was the residence of the last sultans and of Kemal Atatürk himself. Abdülhamit II, however, preferred to live in the nearby pavilions of Yıldız. This was originally a modest group of buildings, built at the behest of the Sultana Mihrisah at the beginning of the 19th century. Abdülhamit greatly enlarged the buildings, adding reception halls and living quarters, a small theater, and an art workshop. The fountains of Istanbul are elegant and picturesque expressions of the Ottoman spirit and taste, and some of them are authentic works of art. The richest were not simple public fountains, but pavilions where servants distributed drinks to thirsty passers-by. Most of these pavilions date from the 18th century. The Sultan Ahmet III fountain is near the entrance to the Topkapı Saray, behind Hagia Sophia, and is a square marble kiosk with four small domes protruding around the sides and one in the middle; the water was distributed through bronze gratings set into each corner; it was completed in 1728. The Tophane Fountain is a square marble pavilion; the protruding cornice and lead dome crowned with small towers, also in lead, have been replaced. Other fountains and sebils are not of the freestanding type, but project from walls (the Eyüp, the Sipahi Mehmet, Emin Aga, and others).

The district beyond the Bosporus, Galata-Pera, has undergone considerable development. One of the 14 regions into which the city was originally divided existed here. This was Sicae, or the "Regio tertia-decima," which, because of its position on the Golden Horn, has always been of considerable commercial importance. In 1303, the Genoese, unlike the Venetians and the other colonies which had settled down on the opposite shore of the Golden Horn, were granted it in concession and then (1349) obtained permission to enlarge it (building, among other things, the Tower of Galata, the massive bastion which still dominates the entire quarter); other expansions occurred in 1352, 1387, 1397, and 1404, until it covered a large area, from the district around the Atatürk Bridge to Sishane and Tophane, with residential quarters that extended from the Tower of Galata down to the shores of the Bosporus and the Golden Horn. After the Turkish conquest, the Genoese walls serving no further purpose, the area beyond them was quickly built up with private and public buildings (the Tekke of the Whirling Dervishes, ca. 1492; the Galata Saray, built by the vizier Ibrahim Paşa in 1526 as a school for pages), but it was later to be occupied mostly by various European embassies, quartered next to each other on more or less large tracts of land granted by the state. This same district was then inhabited almost exclusively by Europeans resident in Istanbul and Turkish citizens of Greek, Armenian, and Palestinian origin, who continued to spread, endowing the quarter with a distinctive cosmopolitan flavor. In the 20th century these colonies of foreigners and alien-born citizens have decreased to a minority and are tending to decrease more and more, while new quarters thronged with modern homes have sprung up, inhabited by people who have moved either from other Turkish cities or from Stanbul itself (that is, from the old city on the other side of the Bosporus). These parts of the city, as well as the suburban centers (especially noteworthy, the ones along the shores of the Bosporus), possess few ancient monuments, but offer outstanding examples of 19th- and 20th-century architecture.

Foremost among the neoclassic buildings are those designed by Gaspare and Giuseppe Fossati, and in particular the Russian Embassy, an imposing building facing across a courtyard of honor onto the Istiklâl Caddesi. This building inspired local artists in the creation of a particular style, the so-called "Turkish Neoclassic," notable examples of which are the above-mentioned Dolmabahçe

and Yıldız palaces; they have marble façades covered with carved decorations consisting of a closely knit intermingling of classical and Oriental elements. An interesting group of modern buildings was built by the Italian architect Raimondo d'Aronco in 1894–1900. Much of it was torn down; all that remain are the strikingly beautiful Botter house in Pera Street, the summer headquarters of the Italian ambassador at Tarabya, and a few lesser buildings. (For descriptions of bazaars and other early commercial and military installations, see OTTOMAN SCHOOLS.)
